TIGRIS, near Baghdad, is in lat. 33° and 500 feet above the level of the sea, 800 feet across, and from 6 to 25 in depth. It is in flood from the rains in December, after which it falls until February, when it has a second rise, of much greater magnitude than the first, in March and April, and it descends again till October. The Tigris has two principal sources in Central Armenia, both of which spring from the southern slope of the Anti Taurus, near those of the Araxes and Euphrates, and not very distant from that of the Halys. It was called Dijlah by the Chaldeans, and the designation applied to it in the Scriptures is Hiddekel, a name which it bears at the present day among a large portion of the people living near its banks. The western branch rises at a spot which is about twenty miles westward of Arghani Maden, and near ten southward of the centre of the Ghuiljik lake : its course is north-eastward along the deep valley at the foot of the elevated ground of Kizan (4,568 feet above the Black Sea), and, after having continued in the same direction towards the heart of Kurdistan, when a little more than twenty-five miles from the spring, it makes a sweep so as to take the direction of Arghani Maden, or nearly south. Diyar Bekr on the Tigris in its prosperity contained forty thousand houses, with numerous cotton-looms constantly at work ; and it enjoyed an active trade in gall nuts, not only with Kurdistan, but also with India, on one side, through Baghdad, and with Europe, through Aleppo, on the other : but at present there are scarcely 8,000 houses, 1,500 Armenians and 6,300 Turks, and its commerce is almost annihilated. Below Diyar Bekr the Tigris contains several islands. Its banks are thinly peopled, and the country about them is only partially cultivated ; but the pasture grounds are rich and well suited for the visits of the nomadic tribes which come occasionally to the river from the neighbouring countries. The windings of the Diyar Bekr river thus far have a length of rather more than 150 miles, whilst those of the tributary by Myafarekin are less than 100 miles. The Lesser Zab, or Altun Su, is augmented by a considerable stream coming from Koh-i-Sanjak, a town of 1,000 houses, and distant about 40 miles north, 35 miles east : from thence it becomes navigable by rafts. At their junction, the Tigris is about 500 yards broad, and a little below there is a kind of cataract, called Kelah, where the descent is so rapid that the river appears as it were to run down hills. This place is much dreaded by the people when descending in boats ; but it does not seem in reality to offer any serious impediment to the rafts so frequently passing between Mosul and Baghdad. The Euphrates steamer not only passed over this difficulty, under Lieutenant Lynch, but also proceeded as high up as the bund opposite the ruins of Nimrud. After the Tigris has succeeded in forcing its way through the Hamrin Hills, at a spot called El-Fattha, on the left bank, there is an abundant supply of sulphur ; and, directly opposite, naphtha rises in great quantities from the bed of the river. The Tigris may be considered as having an average width of 200 yards from Mosul to Bagdad, with a current in the high season of about four miles and a quarter per hour. The country is highly cultivated from Mosul to Nimrud on both sides of the river ; but from the latter place to Tekrit, all cultivation nearly ceases ; and it is but partially found in the tract along the river between Tekrit and Bagdad. The Tigris is navigable for rafts at certain seasons from the bridge of Dyar Bekr to Mosul, a distance of about 296 miles. Below the latter place it is more or less so throughout the year, and the descent to Bagdad is performed with such ease and speed that the river is known by the expressive name of the cheap cameliar. Large rafts supported by 200 or even 300 inflated skins are much in use for the transport of goods, and, when the merchants are on board, a small room is raised on the raft in order to give shelter from the sun and rain. During the flood season the voyage is performed in three or four days, whereas at another time it requires about fifteen days. The Euphrates steamer, under Lieutenant Lynch, went as high as the bund of Nimrud in 1838, and this officer made a map of the river, from Bagdad to Mosul, by trigonometrical operations between points which were determined by astronomical observations. The raft constructed to carry the Right Honorable John Sullivan from Mosul to Bagdad in 1781, was supported by 200 skins, and had on it a small cabin. Below the Tak-i-Kesra or arch of Chosroes, and which marks the site of the ancient Ctesiphon, and a little lower down the remains of the ancient Seleucia, the continuations of the Tigris bear the well-known appellation of Shatt-ul-Dijlah as far as Kut-ul-amarah, a small town on the left bank nearly midway between Bagdad and Kurnah, being about 178 miles by water from the former city, and 97½ miles directly S. S. E. from the latter. Lower down, after passing for about forty miles through marshes and coming near the tomb of Ezra, the river resumes its former size and character, as it winds in the general southern direction to Kurnah, which place is 232 miles from Kut-ul-amarah by the windings, and 144½ in direct distance. The whole course thus briefly described may be estimated at 1146 miles, which is little more than half the length of the sister stream, the Euphrates, from the sources of the latter to their junction at Kurnah, but it discharges more water, owing to the numerous tributaries which it receives on its eastern side, among which may be particularly noticed the two Zab rivers, and the river Diyalah. There are, however, only two feeders of any moment on the western side throughout the long distance from Diyar Bekr to Kurnah. A considerable increase of the river Tigris takes place during the rains of November; subsequently it decreases, and swells irregularly at intervals, till the different feeders are bound up by the frost and snow of January in the Kurdistan mountains. This serious check retards for a time the swelling of the river, therefore its permanent rise, like that of the Euphrates, does not usually begin till the middle of March. There is an active commerce along the Tigris, between Basrah and Bagdad, by means of the large country boats, which go in fleets, and above the latter city it takes place chiefly by means of rafts from Mosul. The regions through which the Tigris and Euphrates rivers run, and the countries intervening have, since remote ages, been occupied by races who have taken a prominent place in history. Aram-Nahrain is the Syria between the rivers of Gen. xxiv. 10 and Deut. xxiii. 4. The greater part of what was called Mesopotamia, in latter times, constituted the territory of ancient Babel, and was the Aram-Nahrain of scripture. The same territory in Gen. xxviii. 2, is called Padan-Aram, or Champagne Syria, both of which designations agree with the description of the country given by Strabo. He says that the Tigris washes the eastern side of Mesopotamia, and the river Euphrates its southern and western; whilst the Taurus separates it from Armenia on the north. Pliny is still more distinct; he says that Mesopotamia has the Tigris to the east, the Euphrates west, the Persian Gulf south, and the Taurus north, with a length of 800 miles and a breadth of 360 miles, the city of Charax being at the extremity of the Gulf. (*Lib.* vi, *c.* xxvii). Mesopotamia extends above 10° in longitude from Balis, in 38° 7′ 10″ east longitude, to the estuary of the old Karun. in 48° 45′ 16″, and 7° 31′ 5″ in latitude from the shores of the Persian Gulf, in 30° to Sumeisat, in 37° 31′ 5″ north latitude; its greatest width being about 170 miles from Jaber Castle to Husn Keifa, on the Tigris, and its extreme length nearly 735 miles. The irregular triangle thus formed has a superficies of nearly 76,117 square miles, including the shores of the Gulf from the Pallacopas to the old Karun. The principal towns of Mesopotamia are Diyar-Bekr, Husn Keifa, Jezireh, Mosul, Tekrit, Sammara and Kut-ul-amarah along the Tigris; and along the Euphrates, Erzingan, Kemakh, Egin, Kebban Maden, Malatiyah, Rum, Kal'ah, Bir, Rakkah, Deir, Rawd, Anah, Hadisah El Uzz, Jibbah, Diwaniyah, Lamlun, Sheikh-ul-Shuyukh, and Kurnah; in addition to Suverek, O'fah, Haran, Seroug, Ras-el-ain, Mardin, Nisibis, Sinjar, El Hadhr, Kerbelah, Mesjid Ali, Samawah, Zobeid, and many other villages, both in the mountains and along the streams, between the two great rivers. Grane, or Quade, Mohammarah, and Basrah are the ports; and the last, being the principal, is next in importance to Bagdad, the capital. The races that have ruled here from the most remote times have been many, and remnants are still to be traced of former dominant peoples in the varied languages still spoken. The inhabitants of the region at present consist of Arabs, Osmanli Turks, Kurds, Turkomans, Syrians, Jews and Christians. Arabic is the general language; Turkish, Kurdish, Chaldee, Syriac, and Syro-Chaldean dialects being the exceptions. The Sunni mahomedan religion is prevalent; but, in Upper Mesopotamia, there are many christians of the creed of Nestorius, some of whom have become Roman Catholics, and Jacobite as well as Roman Catholic Syrians. Professor Rawlinson believes that Chaldea was a part of the great Mesopotamian plain bordering the Persian Gulf on the south with Arabia on its west, and the limit between lower and upper Mesopotamia on the north. Chaldea seems to have been divided into a northern portion from Hit to Babylon, and a southern portion from Niffer to the shores of the Persian Gulf. In each of these there seems to have been a tetrarchy, viz., Babel, Erech, Accad and Calneh, in the land of Shinar (Gen. x. 10), and Hur or Huruk, Nipur and Larsa or Larancha, which seem to be the scriptural Ur of the Chaldees, Erech, Calneh and Ellasar, the northern tetrarchy was Babel or Babylon, Borsippa, Cutha and Sippara, the last the Sepharvaim of Scripture. A Semitic or Aramaic race is usually supposed to have early occupied the great alluvial plain at the mouth of the Euphrates and Tigris. They called themselves Aram, and the Greek called them Assyrians or Syrians, and Niebuhr regards the early inhabitants of lower Mesopotamia as pure Aramæans closely akin to the Assyrians, from whom indeed he regards them as separated only politically, and this view is taken by Bunsen and Muller : but Professor Rawlinson (i. 54) regards as correct the scriptural statement that they were Hamites, Cushite or Ethiopian. The first Babylonish dynasty began B.C. 3784, by a powerful Chaldee kingdom in southern Babylonia, and the historical city of Babylon is supposed to have been built B. C. 3250. The Chaldean dynasty lasted for 1550 years to B. C. 2234, when Babylon was taken by Zoroaster, a Mede, who then founded there the second Babylonian dynasty. The Median dominion ended B. C. 2011, after a rule of 224 years. The Chaldees were on several occasions the dominant race. The term Chaldæa is derived by Pococke from Kula, a tribe, and deva, a god or brahmin. Chaldæans were undoubtedly the first people who dwelt in cities and formed a nation in the south of Persia. They settled in Mesopotamia, but it is supposed that they originally came from near Ararat, and that they had spread north towards the Caucasian range, where they engaged in astronomical pursuits. The ancient Babylonia is the modern Iraq-i-Ajam. The temple of Belus, the sun-god of the Babylonians, in the City of Babylon, was built about B.C. 3,500 or B.C. 3,250 in the era of the largest pyramid, but five centuries before the pyramids generally. This temple was built many thousand years after, and was quite distinct from, the watch tower mentioned in Genesis. The temple of Belus was in the centre of the city of Babylon, and was the vastest monument in Babylon and the world, and seems to have been erected 323 years before the birth of Abraham. It was a temple, but also meant as the watch tower of Babylon. The Chaldee was an Aramaic dialect, differing but slightly from the proper Syriac : Ezra iv. 8, to vi. 8, and vii. 12-26 ; Daniel ii. 4, to vii. 28 ; and Jeremiah x. 10, are written in the so-called Chaldee. There is also a Chaldee gloss in Genesis xxiv. 47. The Babylonian language in the time of Nebuchadnezzar is very close to Hebrew. The Chaldee language may have been that of Terah, but the possibility of the language of Abraham remaining in its original state during the 216 years that he and his family resided in Canaan ; and the 430 years that the Hebrews abode in Egypt ; and the 400 years from the Exodus to David, is supposed by Rawlinson to be untenable ; nevertheless, in S. Asia, where races become secluded and keep themselves segregated, such does often occur. The jungle on the banks of the Tigris is composed of arbor vitæ and liquorice plant, which is tall and very luxuriant, being in some places about the height of a man.

The mouth of the united Tigris and Euphrates is called Bar. From the southern slope of the Anti-Taurus range, there springs the two sources of the Tigris, in central Armenia, both near those of the Araxes and Euphrates, and not very distant from that of the Halys. —*Rawlinson. TIHAI. Hind. The third part.

TII —— ? See Dracæna.

TIK. Hind. Andrachne telephioides.

TIKA. Hind. A round piece of clay, paint, or tissue on the forehead of a hindu. The application of the Tika is the right of sovereigns, and Rajput chiefs claim it as the rite of investiture ; but amongst hindus generally, it means the circular mark made with coloured earths or unguents upon the forehead. See Bhakta Mala, Maths. Tilak.

TIKAL. A coin in use in Burmah, the name of which Major Phayre believes to be derived from Ta-kyat, one kyat. The Tikal or kyat in Burmese weights is equal to 14 tolas, or 100 tikals are equal to 140 tolas. See Ticul.

TIKAL. Hind. Garcinia pedunculata, *Roxb.*

TIKAR. Jav. A straw mat.

TIKARI. See Kelat.

TIKA TIVVA. Tel. Entada pusætha, *DC.*

TIK-BOOMA. Beng. Aplotaxis circioides.

TIK-CHAMA. Beng. Microrhynchus asplenifolia.

TIKEE-OPRA. Beng. Lochennia corchorifolia.

TIKHTA-RAJ. Beng. Amoora rohituka.

TIKHUR. Hind. Curcuma leucorrhiza, C. angustifolia. Arrowroot.

TIKIA KACHUR. Hind. Hedychium spicatum.

TIKIARU. Hind. The flat or Chinese peach, the best kind on the plains.

TIKKARI, also Tikkarika. See Inscriptions.

TIKOR. Beng. Curcuma angustifolia, C. leucorrhiza, C. rubescens.

TIKRI. Hind. or Thikri, Boerhavia procumbens. Tikri-ki-baji, Tikri-ki-jar, Duk. Greens and root of B. diandria, also of B. tuberosa.

TIKOOR, also Tikul. HIND. Garcinia pedunculata.

TIKOOS? See Penang, Lawyer.

Tiles are made of clay and baked in an oven or in the open air, to harden them. They are of various shapes and sizes, and are used chiefly for covering roofs, and occasionally also for paving floors and making drains.—*Faulkner.*

TILE-TEA, a kind of flat brick tea, of much solidity, made in China, and taken to Kiachta, where it is sold to the Armenians and Tartars, who distribute it through the Caucasian provinces and Eastern Siberia. The Kalmuck, Kirghis, and Buratria nations consume the greater part of it. It is prepared in a different manner from common tea, being stewed with milk, butter, salt, and herbs, constituting rather an article of food than a dietetic beverage.—*Simmond's Dict.*

TILI. HIND. of Muzaffargarh, the pith of the culm of sirki, Saccharum moonja.

TILIACÆ. JUSS. The Linden tribe of plants, consisting, in India, of 5 genera, 32 spices, viz. 5 Corchorus, 4 Triumfetta, 21 Grewia, 1 Berrya, 1 Brownlowia. The general properties are mucilaginous and emollient Corchorus olitorius, the "pat" of Bengal, is cultivated for the fibre of its bark, which is employed to form cordage for agricultural purposes and boats, also to form gunny, a coarse cloth, and likewise to form paper; and C. capsularis, the "ghi-nalita-pat" of Bengal, is grown from India to China for the same purposes. Triumfetta angulata is the "bun okra" of Bengal; several species of Grewia yield useful products, and Berrya ammonilla yields the valuable Trincomallee wood of commerce.—*Voigt.*

TILIACORA ACUMINATA. MIERS. *Hook. & Th.*

Cocculus acuminatus, *W. & A.*
Menispermum acuminatum, *Roxb.*

TILIA GARJAN. BENG. RAKHU. Dipterocarpus angustifolius, also D. lævis, and D. natus.

TILIA KACHANG, also Mitha tilia, HIND. Aconitum napellus.

TILING, the nation speaking the Telugu language; the Tiling and Canarese are almost of similar physical frame:—have tall, graceful figures, but as a rule, the Tiling are fairer than the Canarese. The great similarity of the two languages, Canarese and Telugu, imparts an impression that they are of the same stocks, who have separated in more recent times, and that circumstances have modified their characters and personal appearance. As a rule, the inland tract of table-land country occupied by the Canarese from the southern part of the Mysore country through Bellary in the Ceded Districts, up to Bejapore, is arid, and the soil yields as food crops small cereal grains, Eleusine corocana, Setaria italica and germanica, Panicum, and Pencillaria spicata, which even the humbler labourers of the south of India only use on pressure, when scarcity or dearth prevails, and a hot, arid climate, with a less nourishing food, may have led to their darker complexions. See India. Teloogoo.

TILPATRA, or Tilpattar. HIND. Acer creticum, A. cultratum, and A. sterculiaceum, also Marlea begonifolia.

TILPHAR. HIND. Impatiens, *sp.*

TIPPOO, son of Hyder Ali, and commonly known as Tippoo sultan, a ruler in the peninsula of India, whose capital was Seringapatam, a fortress which was taken by the British in 1799, and Tippoo fell in the storm. See Tipoo.

TILUM. SANS. Oil, vegetable or animal.

TILUN. HIND. Edwardsia mollis.

TIMA, also Falagh. MAL. Tin.

TIMALIA, a genus of birds of the sub-family Timalinæ, of which several species, T. pileata, *Horsf*, the "red capped wren babbler," occurs from northern India to the Eastern Archipelago; T. nigricollis, *T.*; T. erythroptera, *Bl.*; T. maculata, *T.*; and others occur in the Malay peninsula and E. Archipelago. Horsfield observes that T. pileata is not unfrequent in the groves and small woods which abound throughout Java. It often, he says, approaches villages and plantations, constructing its nest in the hedges; and he speaks of it as one of the social birds that delight to dwell in the vicinity of cultivation. In large forests he did not notice it. He describes its flight as low and interrupted, and adds that wherever it resides it is a welcome neighbour, in consequence of the peculiarity and pleasantness of its note, which consists of a slow repetition of the five tones of the diatonic scale (C, D, E, F, G), which it chants with perfect regularity, several times in succession, and at small intervals of time. Dr. Horsfield further remarked that the sixth tone was sometimes added; but as this required apparently an extraordinary effort, it was by no means so agreeable to a musical ear as the simple repetition of the five notes, which appear to be the natural compass of the bird's organs.—*Jerdon, Birds of India. Eng. Cyc. quoting Horsfield's Zoological Researches in Java.*

TIMBAL. Ficus Roxburghii, also F. macrophylla.

TILLANG-CHING. See Nicobar Islands.

TILLA CHETTU. TEL. Excœcaria agallocha, *Linn.*

TILLA KADA. TEL. Euphorbia dracunculoides, *Lam.*, also E. Rothi, *Wight's Icones*, also Mucuna atropurpurea, *DC.* 782.

TILLARI. KARN. TAM. TEL. A night watchman.

TILLAWEE NUDDY is near M'jereah in Chuprah.

TILLI TANDRI. TEL. Father and mother, answering to the Appa-amma of the Tamul race, and the Ma-bap of the Urdu: any protector.

TILLUK, or Peshwaz. See Tica.

TILONG. HIND. Quercus dilatata.

TILOTTAMA. SANS. From tila, dark spots on the skin, and oottămă, excellent.

TILIYA-KURA. BENG. Cocculus acuminatus.

TILIYA-LAOO. BENG. Bottle gourd; Cucurbita lagenaria, C. punctata.

TILJOOGA, a river near Soopul in Muzaffur nugur.

TILJOR. SW. Deals.

TILK. TURK. Talc.

TILKACH ALU. HIND. Saxifraga ligulata.

TIL-KA-TEL. GUZ. HIND. Gingelly or Sesamum oil.

In contradistinction to dye-woods, woods for engraving, ornamental woods, &c., says Tredgold, wood felled and seasoned, and fit for building purposes, is called timber. It is met with in commerce in various forms. Mr. Poole in his statistics of commerce, mentions that the trunk of a tree, with or without boughs or branches undressed, is termed round timber; when hewn into logs, square; when quartered, billets; when split, staves and lathwood; when sawn, deals, battens, planks, boards and scantling. The stems or trunks of several kinds of young trees are called spars, poles and rickers, also prop wood and postwood. In India, there are peculiar terms applied to timbers of different kinds. Reepers, in southern India, are the split stems of the palmyra tree. Timbers are also sometimes classed according to the purposes to which they are applied; oak, teak, green heart, black mara, are designated ship-building woods; teak, saul, padouk, &c., are recognised ordnance woods; while Trincomalee, rosewood, red-wood, satin wood, snake wood, mahogany, ebony, kyaboca, zebra, tulip, and other furniture woods, are usually called fancy woods. Timbers, says Tredgold, are also spoken of as hard, soft, and tough, but there are no established degrees of these qualities, and Tredgold, in defining them, merely says that a hard wood yields less to a stroke or impression than a soft wood, and that wood is the toughest which combines the greatest degree of strength and flexibility. The timbers of commerce are also recognised as from the sap-wood or heart-wood. Sap-wood is that part of the wood next the bark, and the heart-wood is near the centre of the bole or stem. Sap-wood is softer, and generally lighter coloured than heart-wood, and is found to decay more rapidly, and to be more subject to attacks of insects. The proportion of sapwood varies much in different trees. In many trees, such as those that produce the ebonies of commerce, the line of demarcation between the heart and sap-wood is so strongly defined as to arrest attention, and permit the application of those two parts of the timber to different economic purposes, and the sapwoods and heart-woods in such cases, though the products of the same tree, receive in commerce distinct names. In other trees, the change from the sap-wood to the heartwood is gradual; but, in all cases, the sapwood preponderates in young trees, and the heart-wood in the old. Also, he says, according to Buffon and Duhamel, in trees that have not arrived at maturity, the hardness and solidity of the wood are greatest at the heart and decrease towards the sap-wood. But, in the mature or perfect tree, the heartwood is nearly uniform, while that of a tree on the decline is softer at the centre than it is next the sap-wood. Tredgold quotes the opinion of Sir Humphry Davy (*Agricultural Chemistry, p.* 220, 4*th ed.*) that the decline of trees is caused by the decay of the heartwood. And in India, where vegetable life abounds, the correctness of that opinion can be testified to by every observer. As with the animal world, so with the vegetable creation, trees have the three stages of infancy, maturity, and old age; and Tredgold (p. 196) tells us that the oak and chesnut trees, under favourable circumstances, sometimes attain an age of about 1000 years; beech, ash and sycamore to half that age. The plain tree, the Chinar of north-western India, is said to live to a great age. In forestry, therefore, the rule deducible from our knowledge of these principles and facts, as indicated in Tredgold (p. 197), is to fell timber trees when in their maturity. For, if felled too young, there is much sap-wood, and even the heart-wood has not acquired a proper degree of hardness, and such timber cannot be durable. On the other hand, if the tree be not felled till on the decline, the wood is brittle and devoid of elasticity, is tainted and discoloured, and soon decays. The rule therefore is to fell the mature tree when the quantity of sap-wood is small, and the heart wood nearly uniform, hard, compact and durable; but too early is worse than too late. Therefore, for south-eastern Asia, a tabular statement showing the ages at which its various timber trees reach maturity is very necessary, though still a desideratum. Dr. Brandis tells us that in British Burmah, a full grown teak tree of 9 feet in girth cannot be supposed to be less than 160 years old, and it is somewhere mentioned that it should not be cut for timber under 80 years of age. In England, as Tredgold tells us (p. 198), oak is never cut for timber under 50, nor above 200 years of age. Dr. Brandis tells us that the strength and density of teak timber vary exceedingly, according to the locality where the tree is grown. The extremes observed in preliminary experiments were, as to weight lbs. 40 to 50 per cubic foot, and 190 lbs. to 289 lbs. breaking weight. It is well known that the timber of those trees which grow in moist and shady places, is not so good as that which comes from a more exposed situation, nor is it so close, substantial, or durable. The preservation of timber naturally arranges itself into the preservation of growing timber, and that of timber when felled. Since the close of the 18th century, it has been a growing belief that the climate of a country is greatly modified by the scarcity or abundance of its trees and forests. Some years ago, in 1845, Dr. Balfour furnished the Madras Government with a memorandum of all existing information on this subject, and it was a matter of enquiry at a subsequent meeting of the British Association. Other writers, since then, have written on the connection between the amount of rainfall and the number of trees in a country, and it is now generally recognised that they do exercise a powerful influence on the climate of the region or district in which they grow. In a tropical country like India, therefore, the preservation of existing trees, and their extension in arid districts, is a matter of much climatic importance. Dr. Cleghorn, in a report for 1860, gives on this point the following extract from a letter :—"The higher sholas clothing the ghats on both sides are of the utmost importance, and the climate is believed to suffer the greatest detriment from their removal. I would therefore suggest that the high wooded mountain tops overhanging the low country (such as Hoolicul) should be preserved with rigid care, the forest there should not be given over to the axe, lest the supplies of water be injured. It is the opinion of many persons, in which I concur, that the vast clearings which have taken place have had a share in producing the irregularity of the monsoon, which has of late years been so much complained of in Coimbatore. In order that the course of the rivulets should be overshadowed with trees, I conceive that the hills should be left clothed to the extent of about half of their height from the top, leaving half of the slope and all the valley below for cultivation; this available portion would far exceed in extent " the higher ridges, which should be considered reserved. It is not, however, merely from legitimate use, that the forests are decreasing :— all the conservators notice the conflagrations which arise naturally, and are caused by the wild races who, alike in India and in Burmah, effect a clearance by fire, in order to obtain a fresh soil for a temporary cultivation. Dr. Cleghorn, in another report, says that " the forest conflagrations in the Madras Presidency are of frequent occurrence; the unextinguished fire of a camp of Binjara, the sparks from the torches or cheroots of travellers, the spontaneous ignition from friction of bamboos, but much more frequently, the wilful burning of grass by the hill tribes, as heather is burnt in Scotland, in order that the ashes of the herbage may nourish the roots of young grass, and thus improve the forage of their cattle, are, he says, among the causes of this devastation, which extends annually over large tracts. The largest trees skirting the forest suffer more or less from these fires, the saplings are scorched and mutilated, and the smaller seedlings perish. If the same spot is again visited by conflagration in the following year, the largest trees which escaped the first time are often consumed. But the main economic value of timbers, apart from considerations of strength, durability, texture and color, will depend on the quantity in which they can be produced for buildings, for railways, and the many purposes for which timber is indispensable. Nor is the supply of timber for building and furniture making purposes all that we have to consider. In countries for all practical purposes destitute of coal, the supply of fuel for manufactories, railways, and steam flotillas, as well as its domestic consumption, is another important item in the consideration of timber resources."

The preservation of the forests of India, and the search for timbers and fancy woods suitable for the purposes of the State and wants of the people, have long been objects of attentive interest to the Governments of the several Presidencies in India. Amongst the earliest of the scientific investigators we find recorded the names of Drs. Roxburgh Ainslie, Wallich, Royle, Gibson, Falconer, McClelland, Mr. Graham, Dr. Wight, and Rev. Dr. Mason. Dr. Balfour of the Madras Medical Department, published a book on the Timber Trees of India, which went through three editions between 1858 and 1870; while Mr. Edye, Colonel Frith, Captain Dance, and Mr. Rohde, applied a large practical knowledge of the qualities of timber to ascertain the woods suitable for the manufacturing industries of India. The course adopted by the principal of the scientific inquirers in identifying the plants, has been to endeavour to identify the tree botanically, and then supply the names by which it was familiarly known to the people of the country; and there is no doubt that if not the only proper mode, it is a more correct method than to endeavour to trace out the botanical name of a plant from its native name. In following the latter course, it is impossible but that, from the twenty or thirty languages spoken throughout the regions of the East Indies, the same plant must come to be described repeatedly under different names, and true progress will not be made until having properly identified the botanic relations of the plant, the subject be completed by endeavouring to supply all the synonyms by which it is known. One point which practical men should particularly be made aware of is that the vast extent of the regions of the East Indies, their various climates and physical conditions, render it impossible that the same tree can produce the same quality of timber in every locality where it grows, and this indicates the necessity of not pinning the faith on to any one wood merely because a wood from the same species, the growth of another district, may have been found highly suitable for the work, to which it was put. Ordnance officers in particular should keep this point in view, and not use a wood, however lauded, unless the timber have been brought from the same place as it was obtained by those whose praise they act on, or until severe trial has proved that when grown in the new locality, the timber it yields is equal to all that is required of it. As an instance of this, may be cited the majestic teak which grows to an immense height in Malabar, on the Godavery, in Pegu and Tenasserim, proceeds far into the interior of India, and may be seen in the mountains of Bundelcund, but is there only in the form of a moderate sized shrub; and even where it presents the same form of a gigantic tree as in Malabar and Pegu, the quality of the timber it yields is essentially dissimilar.

In examining the comparative value of different sorts of wood, it is of the first importance to ascertain the nature of the encrusting matter deposited throughout the cells and tubes of the wood. For all practical purposes, those woods appear to be best in which the cells are lined with resinous matter; those filled with hygroscopic gummy matter are for the most part of less value; they are seasoned with difficulty, and are always more liable to decay. The best woods are those having a strong fibre protected from all external influences by a coat of resinous matter, or at least of a matter insoluble in water, and one which does not attract atmospheric moisture. It is probable that some of the ornamental and other woods of India will become articles of import into Britain when their properties and use are better known and appreciated by that country's artizans.

The most important application of wood is in the building and repairing of houses and ships, and in the construction of machinery. For this purpose the larger trees which come under the denomination of timber are employed. Great Britain long supplied its own wants; but increasing population led to an extensive demand on other countries for the supply of timber, which was met chiefly by vast pine forests on the shores of the Baltic and northern Europe, and also from Canada. Timber from the latter country, however, was soon found to be inferior in strength and durability to that of the north of Europe, and fell into disesteem among ship-builders; hence arose the practice of introducing the words "Memel fir" in specifications for building. The preservation of growing timber is an art of considerable importance, and can only be said to be cultivated in countries where timber is comparatively scarce. The practice of thinning out plantations is of importance not only as affording a supply of wood, but, by admitting an increased supply of air and light to the remaining trees, their growth is greatly promoted. Forest trees are often planted on soil that is unfit for other purposes, and by the annual fall of leaves they accumulate in time a certain depth of soil. The proper time for the felling of trees is that in which the largest quantity of hard and durable wood can be obtained as free from sap as possible. It is a common fault to fell trees before they have attained their maturity. If suffered to complete their growth they would have the heartwood of equal weight and strength throughout, whereas in those cut down prematurely, the centre wood alone possesses this requisite strength, the outer concentric rings being considerably softer: such timber may be said to decrease in hardness and strength in arithmetical proportion as it approaches the sap-wood. Timber is felled during the cold months, when the natural juices are most inactive and the tree is in a measure dormant. But before the timber can be used, the juices must be got rid of from the capillary vessels, or the wood will remain moist or green for a considerable period, and the planks formed from it will, in a confined situation, become stained, and then subject to decay or dry rot: these effects are prevented by free exposure to dry air. It is usual in the royal dock-yards of Britain to cut out the timbers for ships of the required shape and dimensions about a year before they are framed together, and the skeleton frame is usually left another year to complete the seasoning. Other mischiefs, almost as fatal as decay also occur to unseasoned woods; round blocks, cut out of the entire circular stem of green wood, or the same pieces divided into quarterings, split in the direction of the medullary rays, or radially; also, though less frequently, upon the annual rings. Such of the round blocks as consist of the entire section contract pretty equally, and nearly retain their circular form, but those from the quarterings become oval from their unequal shrinking. In general, woods do not alter in any material degree in respect to length. Boards and flat pieces contract, however, in width; they warp and twist, and when they are fitted as panels into loose grooves, they shrink away from that edge which happens to be the most slightly held; but when restrained by mills, mortices, or other unyielding attachments, which do not allow them the power of contraction, they split with irresistible force, and the materials and labour thus improperly employed will render no useful service. The natural juices of the tree must be got rid of by seasoning in order that the wood may become dry and hard. After the tree has been lopped, barked and roughly squared, it is left for some time exposed to the weather, and may be soaked in fresh running water (as some think) with advantage, or boiled or steamed. This dilutes and washes out the juices, and they more readily evaporate from the wood at a subsequent period, and the colour of white wood is said to be improved thereby. In this way, fir timber, on its arrival at the port of London, is commonly formed into floats on the Thames, and allowed to remain for some time. When removed from the water, it is left to dry thoroughly before it is taken to the pit to be sawn; usually it is blocked up from the ground so as to have a free circulation of air, and if it be cut into boards, they should be piled one on the other with billets of wood between them, or laid in a triangular form, with their ends alternating so as to allow the air to have free access to them. Thin pieces will be seasoned in about a year, but thick wood requires two or three years before it is removed into the house to complete the drying. The warm air of a stove heated room will then act upon it with benefit. When cut trees are killed and left to dry in the forest, the sap rapidly disappears if left standing with all their branches; and sawn wood is most rapidly dried by being stacked on end with the highest end of the tree uppermost. In the stacking of timber for the purpose of seasoning, the pile should be so far raised from the ground as to allow the air to circulate below, as well as around and through it; and if not sheltered from the rain, care should be taken to prevent the wet from lodging in any part. It is now usual in dockyards to have elevated supports of iron or of stone for the stacking of timber, and ships are now built under covered sheds. The drying of timber should be gradual, for if rapid, it suffers a loss in toughness as well as in pliability: the pores at and near the surface become contracted, and prevent the interior moisture from escaping. Plans for the more rapid drying of timber by means of kilns have, however, been tried, as in Price's patent, in which timber destined for building purposes is placed in a room, into the lower part of which hot and dry air is introduced, and this, charged with the moisture of the timber, is allowed to escape at the upper part. By this, timber can be seasoned in one third of the time required in the open air. Oak loses nearly two-fifths of its weight by proper seasoning. All timber should be dry before it is cut into planks, or they would be liable to warp and shrink. The presence of air, light, and moisture seem to be necessary to the revegetation of timber, or the growth of that fungus which leads to its destruction. Mr. Fincham of Her Majesty's dock-yard, bored a hole in one of the timbers of an old ship built of oak, the wood being sound, and in 24 hours the admission of air caused the hole to be lined with a white mouldiness due to the growth of a peculiar fungus, which some time after became so compact as to admit of being withdrawn like a stick. Cracks or splits in timber would therefore predispose it to decay in damp situations by admitting the air. There are great differences in woods as to their power of resisting decay; some perish in a year or two, others are sound and even fragrant for centuries. Teak has been found to last six or seven times as long as oak when used in green houses, as boxes for growing plants, the latter wood not existing more than two or three years; but the moist atmosphere, light and heat of a greenhouse, form a severe trial for any wood. In addition to timber-trees, a vast variety of woods are used for ornamental purposes. In a series of papers contributed by Professor Forbes to the Art Journal, on "Wood used for Ornament and Purposes of Art," some clear distinctions, definitions, and descriptions are given, which Mr. Tomlinson abridged. The term wood he says, is commonly applied to those portions of the vegetable axis that are sufficiently hard to offer considerable resistance and solidity, so as to be used for purposes requiring various degrees of firmness and strength. Every flowering plant is composed of an axis, and the appendages of the axis; the former consisting of the stem and root, the latter of the leaves and flowers. In trees, shrubs, and under-shrubs, the axis is said to be woody; in herbs it is termed herbaceous. In the former, stems are permanent, and do not die to the ground annually, as is the habit of the latter. A shrub, a tree, an undershrub, a bush, are merely gradations of magnitude in perennial plants; woods valuable for purposes of art and manufactures are derived from all of them. But as bulk and dimensions are necessary to make timber available for extensive use, by far the greater part of the ornamental woods are derived from trees. There are, however, some remarkable exceptions. The wood of roots is different in structure from the wood of stems, and the same tree may furnish two very different kinds of ornamental wood, according as they are derived from its ascending or its descending axis. The wood of the inner portions of a stem may be of very different colour and quality from that of its outer parts. In the immediate neighbourhood of the origin of branches, it may exhibit varieties of pattern, such as to render it greatly more ornamental than elsewhere, and in some cases, when under the influence of morbid growth, reveals additional beauties, so as to be prized for qualities which in nature are defects. If we compare a cross cutting of teak, or oak, or mango, with a like portion of palmyra wood, the differences between them will be seen strongly contrasted. In the former, the layers of wood are ranged in concentric circles round the central pith, and are encased externally in a binding of bark, itself composed of distinct and differently organized portions. In the latter there is an uniform appearance throughout the section, the substance not being disposed in concentric rings, but appearing as if a bed or ground of one kind was studded with specks of another order of tissue. These are not slight dissimilarities; they indicate differences of the greatest structural importance in the economy of the respective trees. Corresponding with them are peculiar modifications of every portion of the plant's organization.

The external aspect of the plants of either type is altogether unlike that of the other. The appearance styled silver-grain in wood is dependent on the cellular tissue of the medullary rays, and is, therefore, exhibited by exogenous woods only. It gives the streaks a glancing satiny lustre that are so ornamental in many kinds of woods. In the oak and beech this appearance is conspicuous. The inner layers of wood, after the tree has become aged, often become compact, and frequently different in color from the new wood. They are then styled the heart-wood. Botanists term them the duramen, and apply the name alburnum to the outer layers or sap-wood. In the former, the tissues have become dry and dense, and charged with solidifying deposits, so as to prevent them aiding in the ascent of the sap. Often, too, they become more or less deeply coloured, so as conspicuously to contrast with pale sap-wood. This difference is especially conspicuous in the ebony-tree, the black portion of which is the duramen, or heart-wood. In the oak, they resemble ebony. Furniture of exquisite beauty has been constructed of yew-wood ; indeed it is admirably adapted for fancy cabinet work, either in mass, or inlaid as veneers : the supply is said, however, to be insufficient. The wood of yew was once extensively used in Britain in the making of bows. The cedar is a native of the warmer temperate mountainous regions of Asia. The celebrity of the cedar of Lebanon dates from a very high antiquity ; and the reputed value of its timber for ornamental and cabinet purposes, has been placed on record from very ancient times. Either, however, more coniferous trees than one have been included under the popular appellation, or the qualities of the wood have sadly degenerated, for that of the existing cedar of Lebanon is by no means remarkable for beauty, durability, or sweetness of odour, all of which properties were pre-eminently ascribed to it. The tree itself is as grand as ever ; one of the most majestic of arborescent elements in the landscape. It was extensively used among the ancients. Nevertheless, this wood, such as we now know it, is not one to choose for carving or house construction. It is very light and spongy, of a reddish white colour, scented like ordinary pine, and not at all durable. It is possible that other kinds of coniferous trees were confounded by the ancients with the true cedar. The Himalayan "deodar," a tree very closely related to the cedar of Lebanon, really possesses all the good qualities for which the latter has been so long celebrated. Even now travellers in the East, in writing about cedars, often confound various kinds of arborescent juniper under that name. The numerous race of pines and firs for the most part are more useful than ornamental, so far as their timber is concerned. Some of them, however, afford wood with many desirable qualities for furniture-making. Among the natural orders that have affinities with catkin-bearing trees, are the walnut and the nettle tribes. The box belongs to the spurge tribe. It produces a warm yellow wood, much used by the turner, and well adapted for the construction of flutes and similar musical instruments. It is often used for rules and scales, and it is also the chief wood employed in wood engraving. It is sometimes beautifully mottled. In Britain the box grows wild and luxuriant in Surrey, as at Box-hill, but the chief supply of this wood is derived from the southern parts of Europe, and from Asia Minor. A distinction is drawn between "Turkey" and "European" boxwood. The latter is more curly, softer, and paler than the former. Dr. Royle and Major Hay have called attention to a species of Buxus, a native of the Himalayas, yielding a wood possessing similar qualities with that in common use, and having the advantage of being found of considerable size and thickness. The ash and the olive are members of the olive family. The former familiar tree yields a timber remarkable for toughness and elasticity, and excellent for machine and agricultural purposes, but not much used for finer applications. When, however, the grain is zigzag, it is adapted to the making of furniture of considerable beauty. Olive-wood is imported from the Mediterranean countries. It is veined with dark grey, and resembles boxwood in texture, but is softer. The knotted and curled roots are made into embossed boxes. This is done by means of pressure in engraved moulds of metal. The Araliaceæ, a natural order to which the ivy belongs, may be mentioned here incidentally on account of the substance so well known as rice-paper. This was long supposed to be the pith of a leguminous plant; its true nature was first made known by Sir William Hooker, who demonstrated that it was the pith of an araliaceous tree. It was said to be exclusively a native of the island of Formosa, but Mr. Fortune found the Aralia growing in other parts, and it was introduced by him into India. The almond-tree, especially when wild, is said to furnish a valuable wood, but which is little known or used. The great order of leguminous plants, the Pulse tribe, is rich in trees, but not much so in temperate climates, nor is there any ordinary tree of the group upon which stress can be laid. There are now eight descriptions of timber admitted by the British as first-rate for ship-building purposes, and one of these has only been so ranked since the opening of the Great Exhibition. They are :—1, English oak; 2, American live-oak; 3, African oak; 4, Morung saul; 5, East Indian teak; 6, Green heart; 7, Morra; 8, Iron-bark (a recently admitted wood). Of the above the Morung saul is an Indian tree, as well as the better known valuable Teak. The Iron-bark is from New South Wales, and has a density of 1426, and a strength of 1557, (English oak being called 1000). Wood is very valuable as a fuel: the excess of hydrogen contained in it, which, in burning and forming water, requires for equal weights three times as much oxygen as the carbon does in forming carbonic acid, gives out in burning nearly four times more heat than the carbon.

In all countries most of the woods in general use have a variety of names; the local name varies often in the same district. Many have likewise a commercial name, by which they are known in the market, as "Trincomallee" wood, "Coromandel" wood, &c. These names are sometimes given from the place of export, but it is often impossible to trace their derivation. Lastly, there is the botanical name, the sure determination of which is a matter of the first importance, and the means of doing this consists of a small shoot, bearing flowers, fruit, and full grown leaves, either together or separately, pressed flat and dried, so as to be fixed on a sheet of paper. For a complete collection of wood specimens, there should be several of each wood from various localities. 1st, A horizontal section of the tree with the bark complete, and about 3 inches thick. 2d, A plank about 3 inches thick and about three feet long, cut from the log about half-way between the pith and heart, the bark, sap-wood, &c. being retained. 3d, Two or three bars about 2 feet 6 inches long, 2¼ inches square (if the plant grow so much) cut from the sound wood. 4th, A turned cylinder of hard or ornamental woods, 1 foot long and 3 inches in diameter.

The value of wood depends much on its age; the young tree possesses strength and elasticity in a greater degree than mature, i. e, when it would shortly cease to increase in diameter; as it increases in age it acquires its maximum of stiffness and durability; in its aged state, it will probably best suit the purposes of the cabinet maker. The grain of the wood depends greatly on the nature of the soil, being generally straight and open in a tree growing rapidly, in a rich, and the reverse in a poor soil. In some cases, the root affords wood of great resisting power for furniture; the root of a healthy oak is prepared for spokes of wheels, and veneers from that of an aged specimen often bear a high value for cabinet makers' purposes. In collecting specimens of the characters of wood, there are several points to which attention should be directed, viz:—

a. The uses to which the several parts of the tree is applied, and those for which experienced natives consider it specially adapted.

b. Its distribution in the district, the localities where the best is procurable, with the nature of the subsoil, the distance from the nearest seaport or town of any size: whether water carriage be available.

c. The extent of supply, whether this is increasing by self-sown seedlings of fresh plantations, &c., or decreasing; the average size in height and circumference of the native tree, its character, whether straight or crooked, the average length, &c. of the logs or planks, the time required for seasoning, and the amount of seasoned timber generally procurable.

d. The age at which the tree reaches maturity, i. e., when increasing age brings no further increase of diameter. This is a point of great importance, for on it depends the relative value of trees for planting. Thus, supposing there are two species of trees, of equal value as regards timber, &c., but one attains maturity in 25, while the other requires 35 years; it is obvious that the first is much the more valuable of the two, its money value being realised 10 years sooner.

Various methods have been adopted to render wood less combustible, by saturating it with solutions of phosphate of soda, and muriate or sulphate of alumina and chloride of calcium, but the utmost that can be reasonably expected from the most efficient protective coating or impregnating material is, *first*, that it should considerably retard the ignition of wood exposed for some length of time to the effects of a high temperature, or of burning matter in its immediate vicinity; *second*, that if the vapours which the wood emits by continued exposure to heat become ignited, the flames thus produced shall not readily affect the fibre of the wood, and shall cease almost directly on the removal of the wood from the source of heat; *third*, that the prepared surfaces of wood when in actual contact with burning unprepared wood shall have little tendency to ignite, and thus give no cause for the fire to spread. A plan proposed is to impregnate wood with silicate of soda, and to coat its surface with a silicate. The impregnating of the wood is effected by putting it into a solution of the silicate. The surface of the wood is then washed over with a somewhat diluted solution of the silicate of soda. After an interval of at least two hours, a coating of thick lime-wash is applied over the silicate; and finally, on the following day, a strong solution of the silicate is applied over all. In this way a protective covering is given to the wood. The process may be used with benefit in the case of timber employed for wooden huts.

To protect timber against insects, use one ounce of corrosive sublimate to one gallon of water, having previously rubbed the mineral up with a little alcohol to increase its solubility ; immerse the wood in the solution for one week, but allow carpets and cotton cloth to remain only for two days. The white ant will but very partially, if at all, destroy the substance of any thing macerated in the solution, and on discovering its nature, they immediately disappear. With woollen cloth the effects are less decisive, as the solution appears to be unable to penetrate the fibres of the wool, and is partially removed by washing; but under cotton carpets, rush mats, &c., the insects will burrow for the first day or two, and then disappear ; and with regard to timber they are even more fastidious, and place, in their covert ways, a coating of earth between themselves and the wood ; evidently anxious not even to come into contact with the poison. The advantages of preparing wood in the way recommended, are not, however, confined to its immunity from the attacks of the white ant, as it is now generally known that the same preparation (Kyan's patent) effectually resists dry rot, or other decay, and from the power it is known to possess of coagulating the albumen contained in the wood and indurating the fibres of the softer and cheaper varieties of timber, and rendering them immediately fit for use, if cut down even in a state of active vegetation, are circumstances well worthy of public attention.

The following list contains the names of the principal trees which are felled for timber or fancy woods throughout the various countries in the East Indies.

Acacia amara. Nulla balasoo, *Tel.* Woonja maram, *Tam.*
Acacia Arabica. Curvala, *Tam.* Tuma, *Tel.* Babool, *Hind.*
Acacia catechu. Wodahalay, *Tam.* Sha, also Kwouthee, also Sha-bin, *Burm.*
Acacia cinerea.
Acacia elata. Seet, *Burm.* Tella sopara, *Tel.*
Acacia ferruginea. Ausandra, *Tel.*
Acacia halkorn. Dulchirram, *Tel.*
Acacia leucophlœa. Velvaila, *Tam.* Tella tuma, *Tel.*
Acacia odoratissima. Caroovangay, *Tam.* Telsoo, also Shinduga, *Tel.*
Acacia serissa. Seet, *Burm.*
Acacia Smithiana.
Acacia speciosa. Velvangay, *Tam.* Ped-dulchirram, also Dirasana, *Tel.*
Acacia stipulata. Seet, *Burm.*
Acacia suma. Tella sundra, *Tel.*
Acacia sundra. Currangally, *Tam.* Nulla sundra, *Tel.*
Acacia vera ? Andere, *Sing.*
Acer cultratum.
Adansonia digitata. Papara poolimaram, *Tam.*
Adenanthera pavonina. Kwæ-gyee, also Y wai-gyee, *Burm.*
Ægle marmelos. Vilvay marum, *Tam.* Oo-Sheet, *Burm.* Maredu, *Tel.* Bael, *Hind.*
Agati grandiflora. Agathy, *Tam.* Pouk-ban, *Burm.*
Agathis loranthifolia.
Aglaia spectabilis.
Ailanthus excelsa. Peru marum, *Tam.*
Alangium decapetalum. Alinjee marum, *Tam.* Udugu, *Tel.*
Albizzia odoratissima.
Alstonia scholaris. Kori, also Kowun, *Can.* Satween, *Mahr.*
Anacardium occidentale. Moontheree Cotty marum, *Tam.* Thub-bam bu, *Burm.* Jidimamidi, *Tel.*
Anacardium latifolium. Bheela, *Hind.*
Ancestrolobus carnea. Zoung ali, *Burm.*
Ancestrolobus mollis. Yin-bya, *Burm.*
Andrachne apetala.
Anissaphyllum Zeylanicum. Welippiyenna, *Sing.*
Anogeissus acuminatus. Paussee, also Panchee, *Tel.*
Anogeissus latifolius. Sheriman, *Tel.*
Aponogeton crispum. Cocatiye, *Sing.*
Aquilaria agallocha. Aglay marum, *Tam.* A-Kyau, *Burm.*
Amoora (Aglaia) rohituca. Kha-yo, *Burm.*
Antidesma paniculata. By-it-zin, *Burm.* Jana palseru, *Tel.*
Areca catechu. Camoogoo, *Tam.*
Armosia dasycarpa. Thit-wa-jee, *Burm.*
Artocarpus integrifolia. Peing-nai, *Burm.*
Artocarpus echinata. Toung Peingnai, *Burm.*
Artocarpus hirsuta. Angelly wood.
Artocarpus pubescens. Aludel, *Sing.*
Artocarpus chaplasha.
Artocarpus *species* of Tavoy. Pyn-ya-the, also Tana, beng, *Burm.*
Artocarpus sylvestris. Ran funnus, *Mahr.*
Atalantia monophylla. Caatyaloo micha maram, *Tam.*
Averrhoa carambola. Zoung-ya, *Burm.*
Azadirachta indica. Margosa, Neem Tree ; Vay pum marum, *Tam.* Neem ka jhar, *Hind.* Kama-a-pae, also Them-ba, also Kamakab, *Burm.* Yepa, also Yapa, *Tel.*
Bambusa. Bamboo. Baus, *Hind.*
Barringtonia acutangula. Kyai-tha, *Burm.*
Barringtonia speciosa. Kyai-gyee, *Burm.*
Bassia latifolia.
Bassia longifolia. Elooppa marum, *Tam.* Mee, *Sing.* Ippee, *Tel.*
Bauhinea brachycarpa. Bwai-jin, *Burm.*
Bauhinea parviflora. do.
Bauhinea, *Species.* Pul-i-Shinta, *Tel.*
Bauhinea racemosa. Arree, *Tel.*
Bauhinea dipbylla. Pa-lau, *Burm.*
Bauhinea tomentosa. Petan, *Sing.*
Betula bhojputra.
Berrya ammonilla. Trincomallee wood, *Eng.* Halmilile, *Sing.*
Bignonia, *Species.* Kala-goru, also Chinna kala-goru, also Mokka yepa, *Tel.*
Bignonia chelonoides. Kala-goru, *Tel.*
Bignonia suaveolens. do. *Tel.*
Bignonia quadrilocularis. Wursus, *Mahr.*
Bignonia xylocarpa.
Blackwellia spirale.
Blackwellia perpinqua.
Bombax heptaphyllum.
Borassus flabelliformis. Palmyra tree, *Eng.* Htan, *Burm.* Tal, *Sing.*

Boswellia thurifera.

Bridelia montana. Goonjan murral, *Can.* Assuna, *Mahr.*

Bridelia spinosa.

Bruguiera Rheedii.

Butea frondosa. Pouk, also Pouk-pin, *Burm.* Calukeale, *Sing.* Motku, also Modugu, *Tel.*

Buxus. Box.

Calamus. Canes, Rattans. Kyeing-neo, *Burm.* Bed, *Hind.*

Calophyllum acuminatum. Wal-dombe, *Sing.*

Calophyllum calaba. Gorru-keenee, *Sing.*

Calophyllum longifolium. Thar-ra-bee, *Burm.*

Calysaccion angustifolium.

Calyptranthes cummini. Mahadan, *Sing.*

Calyptranthes cariophyllifolia. Batte dombe, *Sing.*

Calyptranthes jambolana. Aiubo, *Sing.*

Cannarium geniculatum.

Canthium didymum. Nulla regoo, *Tel.*

Canthium parviflorum. Balsu, *Tel.*

Capparis aphylla.

Capparis grandis. Reygutti, *Tel.*

Carapa, *Species.* Tai-la-oon, *Burm.* of Tavoy.

Careya arborea. Ban-bwæ, or Baub-wai, *Burm.* Buda-darmee, *Tel.*

Carallia lucida. Keerpa, *Beng.*

Carallia zeylanica. Davette, *Sing.*

Carpinus viminea.

Caryota urens. Kittul, also Nepera, *Sing.*

Cassia florida.

Cassia nodosa.

Cassia Sumatrana. Arramene, *Sing.* Mayalee, *Burm.*

Casearia pentandra. Tha-byai-ywet-kya, *Burm.* Kahatte, *Sing.*

Casearia, *Species.* Peda kal mesura, *Tel.*

Cassia cinnamomum. Dawol Kuroendoo, *Sing.*

Castanea indica. Theet-Khaya, *Burm.*

Castanea martabanica of Tavoy. Norne or Zitha, *Burm.*

Casuarina equisitifolia.

Casuarina muricata. Beef-wood tree, *Eng.* Hten-roo, *Burm.*

Cæsalpinia sappan. Teing-nyet, *Burm.*

Cathartocarpus Roxburghii. Uskiaman, also Urimiddee, *Tel.*

Cedrela toona. Toon marum, *Tam.* Thit-kado, *Burm.* Toon. Tunga, Poma, Jeea.

Cedrus deodara. The deodar, *Eng.* Kelon, *Hind.*

Chaulmoogra odorata.

Chickrassia tabularis. Aglay marum, *Tam.*

Choecarpus pungens. Hedde woke, *Sing.*

TIMMUE of Nepal. Cubebs, Piper cubeba.

TIMMUN. MALAY. Cucumis sativus.

TIMOKO. For the hilts and sheaths of krises, the natives make use of the "timoko," of Java, of which the black and white variegated fragments are called "pelet." There are various kinds.

TIMOR. An island of 249 miles in extent, from lat. 10° 23′ S. to lat. 8° 21′ S., and long. 127° 15′ E. to long. 123° 30′ E. It is formed of high undulating mountains in the interior, though near the sea it is of moderate elevation. The Portuguese settlement of Dieli or Diely, is in lat. 8° 34′ S. and long. 125° 40′ E., and on the north side of the island. Amanoubang is an independent territory situated towards the south-west end of Timor, immediately to the eastward of the Dutch territory of Coepang. Its limits are unknown, and probably vary as the power of the chief becomes increased or diminished. It is the best organized and most powerful of all the petty states of Timor, and is the only one that can give uneasiness to the Europeans whose establishments are scattered along the north-west coasts of the island. About the year 1830, the chief of this territory took offence at some act of aggression on the part of the Resident of Coepang, the principal settlement of the Dutch on Timor, and kept that town in a constant state of alarm by incursions of horse-men armed with spears, and mounted on the small but hardy horses of the country, cutting off the supplies, and killing or carrying away the inhabitants from the very skirts of the town, until means were found to appease his hostility. The Bay of Amanoubang, the "Bay of the Pearl Bank" of the charts, is a deep bight situated 45 miles to the eastward of Point Ousina, the S. W. extreme of Timor. It is bounded by Butu Puteh, a steep white rocky head-land, 800 feet high, on the west, and Point Oubelow on the east. The head of the bight consists of low-land, covered with the "tuak" or Lontar Palm. The chief trading port of the territory is Outouke, about 15 miles to the east of Point Oubelou.

Timor is a word which means the east, and was probably imposed on this island by the Malays, to whose language it belongs, because this was the extreme limit of their ordinary commercial voyages to the south-east. Timor is about three times the extent of Jamaica. Its principal inhabitants are of the Malayan race, but it contains also Papuans or Negroes, and tribes of the intermediate race. The two languages of Timor are the Manatoto, and the Timori, the first spoken at the north-east end of the island, and the last used by many of the tribes as a common medium of intercourse. No alphabet has ever been invented in Timor; but judging by the specimens of its languages, the vowels are the same as those of the Malay and Javanese. From Timor to New Guinea, there runs a long chain of islets, forming, as it were, a wall or barrier to the south-eastern portion of the Archipelago. In these islets the inhabitants are of the same race with the Malays, and speak many languages. In the south-eastern parts of the Indian Archipelago, where opportunities of social intercourse between the various petty tribes are of rare occurrence, every island, every detached group of villages, has its own peculiar dialect, which is often unintelligible even to the tribes in its immediate neighbourhood. In some of the larger of these islands, Timor for example, these tribes are so numerous, and the country occupied by many of them so extensive, that it becomes impossible to form even an approximate estimate of their number. Of one language, the prevailing one, among several languages of the island of Kisa, one of the Sarawati group in the chain of islets already mentioned, Mr. Earl furnished a curious and instructive vocabulary of 330 words. The Kisa is an unwritten tongue, but its vowels are the same as those of the Malay and Javanese.

The Spice Islands, in the Molucca and Banda seas consist of many islands and numerous languages. Mr. R. Wallace says that Timor is occupied by tribes much nearer to the true Papuan than those of the Moluccas. The Timorese are dusky brown or blackish, with bushy frizzled hair, and the long Papuan nose. They are of medium height and of rather slender figure. They are said to be great thieves; the tribes are constantly at war with each other, but they are not very courageous or blood thirsty. They reverence the custom of "Tabu," which they call "pomali" and a palm across a door indicates that the ceremony has been performed. In their excitable disposition, loud voices and fearless demeanour, the Timorese closely resemble the Papuan people of New Guinea. In the islands west of Timor, as far as Flores and Sandalwood island, a very similar race is found, which also extends eastward to Timor Laut, where the true Papuan race begins to appear. Timor is about 60 miles broad, and seems to form the N. E. end of the great range of volcanic islands, which extends N. E. and S. W. from Timor to Sumatra. It has only one active volcano, Timor Peak, near the centre of the island, which was blown up during an eruption in 1638, and has since been quiescent. Coepang in the west end of the island is the chief Dutch town, and Delli, in the eastern part of the island is the capital of the Portuguese possessions. There is nothing that could be called a forest and the whole country has a parched and dry appearance. There are Malays and Chinese, but the native Timorese preponderate and have nothing in common with the Malays, but are much more closely allied to the true Papuans of the Aru Islands and New Guinea. They are of the Papuan type, all have pronounced features, large, somewhat aquiline, noses, and frizzly hair. The women talk to each other and to the men with loud voices and with a self-asserting, quite different from Malay women. The mountaineers of Timor are a people of Papuan type, have rather slender forms, bushy frizzled hair, and the skin of a dusky brown colour. They have the long, somewhat aquiline nose, with the overhanging apex, which is so characteristic of the Papuan, and so absolutely unknown among races of Malayan origin on the coast. There has been an admixture of Malay, perhaps of hindoo as well as of Portuguese, and the coast occupants have wavy and frizzled hair, a lower stature with less prominent features, and the houses are built from the ground. The houses of the Papuan mountaineers are raised on posts. The dead of the Papuan Timorese are laid on a stage six or eight feet above the ground, sometimes open sometimes covered, and are retained there till money for a feast can be obtained, when they are burned. The "Pomali" exactly resembling the Taboo of the Pacific is in full operation here, and a few palm leaves stuck outside of a garden will preserve it from any thief. The people of the neighbouring island of Semao, are like those of Timor, with frizzly or wavy hair, and a coppery brown colour. Amongst the birds of Timor few are ornamental: there are Platycercus vulneratus, a green species of Geoffroyus; Tropidorhynchus Timorensis; Ptilonopus cinctus, a white headed pigeon; the pretty little lorikeet, Tric glossus enteles, and T. iris; Sphæc viridis, a green Oriole; and the red hyacinthina. Of the butterflie ænomaus and P. liris, the swall terflies occur, also Cethosia Le d several Pieridæ. Small quanti and gold are found. The land ma Timor are only seven in number, Macacus nomolgus, common all over the Indo-Malayan Archipelago; Paradoxurus fasciatus, a civet cat; Felis megalotis, a tiger cat; Cervus Timoriensis; Sorex tenuis, and Cuscus orientalis. The S. E. coast near mount Allas is occupied by the Papuan race with frizzled hair in tufts on the head. Mr. Earl says that some of the people on the table land back of Dieli, have opaque yellow complexions with hair of a reddish or dark auburn colour, and that the hair of others is straight, fine, and of a reddish hue, and that every intermediate variety of hue and complexion between this and the black or deep chocolate colour and the short tufted hair of the mountain Papuan is found in Timor, and it is possible that the races are there mixing as its position is next to Papua.

In the Malayan Miscellanies, published under the auspices of Sir Stamford Raffles, at Bencoolen, in 1820, lists of two languages of Timor, and of the languages of the two small islands at its western end, Rotti and Savu, are given, amounting each to 95 words. —*Bikmore*, 116. *Wallace I*, 184 *to* 211. *Earl.*

TIMOR LAUT or the Tenimber islands, form a group which consists of the large island of Timor Laut, the islands of Larat and Virdati, and the numerous small low lands fronting its northern side. The inhabitants of the south-western part of Timor, in the neighbourhood of Coepang, are an exceedingly dark, coarse-haired people, and travellers have great difficulty in coming to a conclusion as to whether they belong to the Malayan or Papuan races, so equally balanced are their characteristics. The anonymous author of an excellent "account of Timor, Rotti, Savu, Solor, &c.," in Moor's "Notices of the Indian Archipelago," seems to have fallen into this state of perplexity; and as his observations are evidently the result of long experience at Coepang and its neighbourhood, the following are a few short extracts which bear upon the point. The natives are generally of a very dark colour, with frizzled, bushy hair, but less inclining to the Papuans than the natives of Ende (on the island of Flores.) They are below the middle size, and rather slight in figure. In countenance they more nearly resemble the South Sea islanders than any of the Malay tribes. Timor Laut means Timor of the Sea, or the Eastern Timor.—

Mr. G. W. Earl, p. 180 *to* 181. *Bikmore, p.* 127.

TIMOR ROTTO. See Rotto.

TIMUN-BIJI-MINIAK. MALAY. Cucumber seed oil.

TIMUNI. A tribe of the Aimak. The Char Aimak consist of four peoples, the Timuni, Teimeni, Feroz Kohi and Jamshidi, all of them of Iranian origin and all speaking Persian. The Timuni dwell at Gorian and Kuli, are seen on the western boundary of Herat, and in the villages and towns situated east of Iran, from Tarbat Shaik's Jam as far as Khaf. About a thousand of their families dwell near Herat. The Teimeni dwell in the Jolgha-i-Herat, from Kerrukh to Sabzwar, the few who have extended to Farrah being styled by the Afghans Parsivan. Each member of the Char Aimak knows no greater enemy than the Afghan, and all attempts to form Afghan colonies amongst them have failed. The Teimeni are of a wild nature. See Aimak ; Char-Aimak.

TIMUR, also known as Timurlang or Timur the lame, changed in Europe to Tamarlane, was born at the village of Sabzwar, (Kesh or Shahr sabz?) forty miles from Samarcand. He was of one of those races of high Asia, to whom in Europe the general name of Turk has been given. One writer describes him as an Uzbek Tartar, Latham describes him as a Turk, and says, whatever the Mongols were elsewhere, the Moguls of India were Tshagatai Turk. They affected a Mongol lineage, just as Timur professed a descent from Tshingis ; whilst the Tshagatai tribe to which he belonged took its name from Tshingis's huntsman, Zagatai, and, he believes, that Tshingis himself connected his line with the Mantshus. At any rate his Mongol son bore the name of a Mantshu predecessor. Again, he professed descent from a virgin. So did Apaoki and Kitan, both Mantshus, before him. He is also said to have been a descendant of Changis Khan. Also, the most famous of his ancestors was said to be Karachar Nevian, or Teragay Nevian, the minister of Zagatai or Chagatai, and the first convert to Islamism amongst the wild conquerors. In his memoirs written by himself, he says, "my father told me that we were descendants from Abu-ul-Atrak (father of the Turks), the son of Japhet." His father is described as a chief who commanded 10,000 horse. The country between the rivers Oxus and Jaxartes, known to the Arabs as Mawur-ul-nahar, had fallen to the share of Zagatai, on the death of his father Chengis Khan in 1227, and the land had been ruled by his descendants for more than a century, when Timur was born in 1337 ; but each succeeding sultan of Mawur-ul-nahar had become more degenerate, and more contemptible than his predecessor, under the insolent independence of powerful vassals. Timur succeeded in attaining supreme power. At the age of 34 he ascended the throne of Samarcand and made himself master of Central Asia. After subduing Persia, Mesopotamia and Tartary, Timur turned his arms (in 1397) against Hindostan. He sent his grandson, Pir Mahomed, to invade India, and joined him on the 12th September 1398 with 92 squadrons of horse. Like Julius Cæsar, he has recorded his own exploits in his work, "Timur Khan's Political and Military Institutions," which was translated into Persian by Abu Talib, and from the Persian into English by Major Davy. "I ordered," he relates, "1,000 swift-footed camels, 1,000 swift-footed horses, and 1,000 chosen infantry to march, and bring me information respecting the princes of India. I learned that Tonktumish Khan had been defeated by Auroos Khan, and sought assistance from me. Received information that the princes of India were variance with each other; that Mahmud Delhi, Mulloo in Lahore, and Sanring Multan, were hostilely disposed towards other. The conquest appeared to me easy, though my soldiers thought it dangerous. Resolved to undertake it, and to make myself master of the Indian empire, did so. Received then the news that the Emperor in Rome had invaded my western provinces, and that the people of Georgia had conquered some of my fortresses in that country. Then I thought, if I pursue my conquests in India, Eran may revolt ; therefore, I regulated my kingdom in Hindoostan, and marched from that country against the Roman emperor, whose provinces I conquered."

In his expedition to India, Bhatnair surrendered on terms, but they burned it to the ground. Timur then marched against Delhi ; in December he had come under its walls and he defeated and dethroned the emperor Mahmud there, and a great massacre ensued. Timur then ordered a general massacre of Meerut, and in March 1399 he recrossed the Indus. Bhatnair, Ahruni, Fattahabad and Tohana all suffered at Timur's hands. Sirsa (Sirsooti) also was attacked and plundered. Those whom he carried into slavery formed a number so large as to overstock the slave-market at Samarcand, and sell at two rupees the head ; among them were many of the wives and children of a proud aristocracy. His soldiers are said to have had a hundred and fifty slaves, and soldiers' boys had twenty slaves to their own share. Timur in his route from Kabul towards Hindoostan, according to Sherif-ud-din, went by way of Irjal, Shenuzan, Nughz, Banou, (or Bunnoo), and thence to the Indus, at the very place where Jelal-ud-din, king of Kharazm, fought with Chengis Khan, and so heroically swam the river after his defeat in 1221. Timur crossed an extensive desert in his way to Bhatnair, but on his return from the banks of the Ganges, he proceeded to the north-west, along the foot of the Sewalik mountains, by Meliapur, Jullindhur, and Jummoo, to the Indus, which he crossed at the same place as before, and in the same manner; and returned to Samarcand by way of Bunnoo or Banou, Nughz or Nagaz, Kabul, Bacalan, and Termed. On his return to Samarcand, his first piece of justice was inflicted upon Dina, a chief magistrate, who, as is related, was the greatest officer in all the land of Samarcand. Timur had left him in the city as his magistrate when he departed, for six years and eleven months; during which time this man had neglected his duties; so Timur ordered him to be hanged and confiscated all his goods. The justice inflicted upon this great man, caused terror amongst the people, and the same punishment was ordered to be inflicted upon another man, who had interceded for this magistrate. A councillor named Burado Meerza, asked for his pardon if he paid a sum of four hundred thousand bezants of silver, each bezant being equal to a silver real. Timur approved of this and when the man had given all he had, he was tormented to give more; and as he had no more, he was hung up by the feet until he was dead. Another piece of justice was inflicted upon a great man, who had been left in charge of three thousand horses, when Timur departed, and because he could not produce them all, he was hanged, although he pleaded that he would produce, not only three thousand, but six thousand horses, if he would give him time. He also ordered justice to be executed upon certain traders who had sold meat for more than it was worth, and upon shoemakers; and other traders were fined for selling their goods at a high price. The custom was, that when a great man is put to death, he is hanged, but the meaner sort were beheaded. On the 8th of January 1405, to invade China, he marched out of Samarcand, in a heavy fall of snow, and crossing the Jaxartes upon the ice he encamped at a place called Otrar. In February he was attacked by fever and ague, and he died on the 17th of that month, in the year 1405, aged sixty-nine, leaving thirty-six male descendants. Timur's body was embalmed with musk and rose-water, wrapped in linen, laid in an ebony coffin, and sent to Samarcand, where it was buried. Mirkhond mentions that he was subject to very severe attacks of illness: which not unfrequently succeeded to any sudden change from violent motion in the field to perfect domestic repose. Malcolm, in his history of Persia, thus sums up the character of Timur. "Though one of the greatest of warriors, he was one of the worst of monarchs. He was able, brave, and generous; but ambitious, cruel, and oppressive." His native language was the "Zagatai Toorki," which at that time prevailed from the Ulugh Tagh mountains to the Hindoo Koosh, and from the Caspian to the Cobi desert. On the death of Timur his vast empire soon fell to pieces; yet the greatest and best princes that ever reigned in mahomedan countries, were the descendants of Timur, who ruled in India until the year 1805, though only nominally, from the first years of the nineteenth century, and in 1857, by joining in a rebellion against the British, they made a final effort to regain supremacy, and the last emperor at Delhi was exiled to Rangoon in Burmah, where he died in 1862. The house of Timur and particularly that of Baber, Akbar and Jehangir, brought many of the trees of their native countries into India. Baber, whenever he found leisure in the midst of his active life, diversified with multitudinous vicissitudes, formed a garden. Akbar followed up the plans of Baber, and introduced the gardeners of Persia and Tartary, who succeeded with many of their fruits, as peaches, almonds, (both indigenous to Rajapootana,) pistachios, &c. To Jehangir's commentaries we owe the knowledge that tobacco was introduced into India in his reign; but in later years, the British have introduced cinchona, many of the acacias, the eucalypti, discovered the tea plant, introduced Sorghum saccharatum and Divi-divi. and the Musa textilis, or Manilla hemp, was brought by Sir George Balfour from the Eastern Archipelago. Multitudes of exotic flowering plants have been introduced into India. The princes of the illustrious house of Timur, though despots by birth and education, present a more remarkable succession of great characters, historians, statesmen, and warriors, than any contemporaneous dynasty in any region of the world.—*Tod's Rajasthan. Tin is one of those metals which were earliest known, though it occurs in comparatively few countries, and though it does not occur in the native state, the acquaintance of the ancients with this metal is accounted for by the circumstances that the ore is found frequently near the surface, and is easily reduced by charcoal and a moderate degree of heat to the state of metal. Tin is found in England, Saxony, Bohemia, Hungary, in Chili, Mexico, the Isle of Banca, the Peninsula of Malacca, and Malacca furnishes the purest tin, and Cornwall the largest quantity. Tin occurs in two states of combination, the peroxide and double sulphuret of tin and copper: the latter is rather a rare substance, and it is from the former that the metal is almost entirely obtained. The peroxide of tin is found —1. In veins where it is intimately mixed with several other metals, as arsenic, copper, zinc, and tungsten: this is common tinstone. 2. In loose rounded masses, grains, or sand in alluvial soil, in which state it is called Stream-Tin. The former, when reduced to the metallic state, yields Block-Tin; while the latter yields Grain-Tin, which is the purer of the two, and it is brought into commerce in these two forms. Wood-Tin is in reniform and botryoidal masses, or in wedge-shaped pieces, which have arisen from their partial destruction: the surfaces are generally water-worn. Stream-Tin has evidently been derived from the destruction of tin veins or lodes, the lighter portions of stony matter having been carried away by the water, which has rounded the fragments of the ore. Tin is mentioned by Moses under the name Bedel; it was used by the Egyptians. The Greeks and Romans obtained it through the Phœnicians from England. It abounds in the Eastern Archipelago, from Mergui to the island of Banca, and is known in commerce as Malacca Tin and Banca Tin; but to these Mergui Tin has lately been added, and it is now known to exist in large quantities in Borneo and other islands. Tin with the Egyptians formed an ingredient in some of their metallic compounds for hardening copper, and they used the alloy for forming swords and spear heads, and its use has long been familiar to the hindoos for forming various metallurgical compounds, as well as for tinning copper, and for various compounds with copper and tin, which are remarkable for their hardness, and for the fine sounds which they emit on being struck. Dr. Wight found that an alloy of ten grains of copper to two and a half grains of tin was the best mixture which a native made in his presence. British spear heads are found to consist of one of tin to ten of copper, and a knife, of one of tin to seven and a half of copper. Mr. Aikin found that eight grains of copper to one of tin formed the hardest alloy. Within the limits of the British province of Malacca are several productive mines of tin and gold, which are worked by thousands of Chinese and Malay miners. But the principal mines of both gold and tin exist in and about Mount Ophir. The depth of the gold mines is from 70 to 200 feet, and the process of pounding the rock and washing the gold dust is simple and rude. The tin is worked in the lowlands at the depth of a few feet, and some of the ores are so rich, that they contain about 80 per cent. of the metal. The whole Malayan Peninsula, from Perak and Queda (Kedah) on the north to the islands of Carimon and Banca, which were once probably connected with the main land, in the south, is one rich deposit of tin. Tin is found in the alluvium at the base of the mountains to the eastward towards Edelgashena. It is abundant in the Tenasserim Provinces, commencing from the mountains in which the Tavoy and Henzai rivers have their rise, the northern limit of tin in the Provinces, to the southern boundary of Mergui, Pakchan river. The richest locality in the province of Tavoy is nearly opposite the city of Tavoy on the eastern side of the mountains. That large quantities of tin must have been taken from Tavoy three hundred years ago, we have evidence in an incidental remark from Mr. Ralph Fitch, who, says Mr. Hough in the Maulmain Chronicle, "travelled in this part of the world in about the year 1586, or 1587." He says: "I went from Pegu to Malacca, passing many of the sea ports of Pegu as Martaban, the Island of Tavi whence all India is supplied with tin, Tenasserim, the island of Junk Ceylon, and many others." Captain Tremenhere found the richest deposit of tin in the provinces, at Kahan on Mergui Island, about eleven miles above the town, and near the Tenasserim river. Kahan itself, he writes, is the highest portion of a low ridge of hills, not more than 200 feet above the level of the river: it is composed of a soft friable white sandstone rock, the upper portions of which are decomposed and irregular. The surface gravel does not contain tin. It is found in the crystallized form interspersed in decomposed granite, forming a vein about three feet wide, which is enclosed by the white sandstone rock, and dips down at a high angle with the horizon. Large scales of chlorite occur with it, which, as they are generally found where the tin is most abundant, is called by the natives 'the mother of tin.' The face of the hill is in one spot scattered over with these, which appear to have been brought down from the vein with other matter from which the tin has been separated by the usual mode of washing. The granite is completely decomposed, and the crystals are easily separated by washing. It was worked during the Burmese rule, and valued as supplying the richest ore of tin. A Burmese residing near the spot, pointed out the place where his operations had ceased. He stated that he had procured considerable quantities of tin daily, and that he often found it in large masses mixed with yellow ground. The crystallized form in which the ore is here found renders its separation extremely easy, and the whole processes of stamping and dressing, which in England are tedious and expensive operations, can thus be dispensed with. No arsenic or sulphur being mixed with the ore, it need not be roasted before it is placed in the furnace. This contains specimens of macled crystals, which in weight and size surpass any thing ever seen in Cornwall, or in cabinet specimens, and containing more tin in proportion to the bulking than any specimens before seen. The largest, which measured about fourteen inches square by twelve deep, was so heavy, as to require some exertion to hold it steady in both hands. Captain Tremenhere transmitted a box of average samples of the ore, to a smelting establishment in Cornwall, having extensive connection with the tin mines of that country. These samples of once-washed ore produced about 70 per cent. of tin, and the twice-washed yielded nearly 75 per cent. The metal very good, almost free from alloy : some of the samples from the Malayan peninsula contain titanium. The consumption of tin throughout the world increases so slowly, there is little inducement to speculate in tin mines. The produce of Cornwall is 6,000 tons per annum, and the quantity produced at Java together with what is raised in the Malayan peninsula, will rather exceed the produce of Cornwall. The average price of tin in Cornwall has been about 72*s.* per cwt., but it falls as low as 56*s.*, which is the present price of the best Straits tin, and tin mines are suffering greatly from the depreciation in the value of their metal.

The tin-ore of India and of the Archipelago is the same as that of Cornwall. It is the ordinary tin-stone, or binoxide of tin. It occurs in veins, and also in rounded masses or grains. It is often beautifully crystallized, interspersed with decomposing granite, and is generally free from sulphur and arsenic. At the two extremities of the Peninsular zone of elevation, Junk-ceylon and Banka, tin sand is diffused in such quantity that its collection has never had any other limit than the number of persons employed in it. In Junk-ceylon and Phunga, under a barbarous government, about 13,000 piculs are annually dug out of the soil. But in Banka, without any improvement on the usual Chinese modes of excavating, washing and smelting, the production increased from 25,000 piculs in 1812, when it was a British possession, to 60,000 piculs.

At numerous intermediate localities throughout the Peninsula tin is obtained, and from the robberies and massacres which from time to time terrify and scatter the little communities of needy Chinese, in whose hands it has remained, the wonder is that so much metal should find its way to the market. In the Siamese countries north of Kedah and in Kedah itself, it is sparingly extracted. From Perak 9,000 peculs per annum were formerly exported, but the produce has now greatly diminished owing to the miserable state of the country. Salangor and adjacent inland states yield about 9,000 piculs. The eastern countries from Kalantan to Phang yield about 11,000 peculs. The present produce of the whole peninsula, including Sinkep and Linga, the only two islands of the Johore Archipelago where it is now sought for, is probably above 40,000 peculs. The peninsular range, therefore, including Banka, yields upwards of 100,000 peculs, so that it equals or exceeds that of Cornwall (6,000 tons).

The annual importation of tin from these mines to Singapore is, on the average, as follows :—

Tringanu	150	peculs or	178	cwt.
Pattani	100	,,	118	,,
Johore	250	,,	296	,,
Lauvan	2,000	,,	2,375	,,
Lingie	1,000	,,	1,187½	,,
Pahang	3,000	,,	3,562½	,,
Kassang	3,000	,,	3,562½	,,

The tin of Siam is worked in the provinces of Xa-lang, Xai-ja, Xamphon, Rapri, and Rak-Bhrek.

Tin mines of Larut, or as they are called, klians, in the Malayan peninsula, are about 100 averaging 60 or 70 feet in depth, and 700 feet in circumference. There were in 1867, 12,000 Chinese at work, earning 5 to 6 dollars monthly. In their superstition, no one is allowed to go near the water wheel with his shoes on, or with an open umbrella. The mines at Cassang near Malacca, north of Ayer panas, cover a space of five or six miles. Since the Chinese began to work them in 1844, their produce increased from 146 peculs to 12,000 peculs in 1852.

The Malay and Javanese term for tin, "timah," is a word used in the Archipelago as a generic term for both tin and lead, the epithet "white," or "flowery,"—"putih" and "sari," being given to tin itself, and that of "black," "itam," to lead, a metal with which, being entirely a foreign product, the Malayan nations are but little acquainted. What may be called the Malayan tin district, or tin field, is, beyond all comparison, the most extensive and the richest in the world, for it stretches from Tavoy in the 14° of north latitude, to Billiton, in the 3° of south latitude, that is, over seventeen degrees of latitude, and ten of longitude. Tin has been found or worked in a great many localities within these wide bounds, as in the British territory of the Tenasserim coast,—in the Siamese island of Junk-Ceylon,—in various parts of the continental territories of the Malayan states, and in several of the islands at the eastern end of the Straits of Malacca. The ore would seem only to become the more abundant as it approaches its termination at Banca and Billiton. The localities richest in tin are ascertained to be those near the junction of the sandstone with the granite, and all the countries rich in tin are also observed to be so in iron. All the ore heretofore worked, it should be noticed, has been found in the alluvium, or detritus of ancient mountains,—what is called in mining language "stream-works,"—obtained, in fact, by washing the soil in the same manner as, for the most part, gold in Australia and California; for no ore has ever been obtained by mining the rock containing veins of it, although it has been traced to them. The greater part of the tin district is covered with an immense forest, and has not been explored. The supply of tin from the Malayan countries promises to last for at least as many ages as that of the coal of England. In the beginning of the present century, the quantity yielded by Banca did not exceed 560 tons, and increasing yearly, in the middle of the century it is not less than 5540 tons. Yet the mines of Banca have now been worked for near a century and a half, being stated to have been first discovered only in the first year of the eighteenth century. The tin mines of Malacca were not worked at all, until as late as 1793, and not effectually by Chinese until 1840, but in 1840 they yielded, paying a seignorage of a tenth to the state, better than 250 tons. The production in the neighbouring Malay states had also greatly increased, so that the whole quantity exported from Malacca amounted in that year to above 960 tons. Mr. Logan estimates the whole quantity produced in the Malay peninsula at about 2350 tons, exclusive of the produce of the Siamese territory; and when this is added to the produce of Banca, namely 5540 tons, we have an aggregate annual yield of 7890 tons, or, making but a moderate allowance for the produce of the Siamese mines, of which we have no estimate, probably not less than double the amount of the tin of Cornwall. Probably, not less than five-sixths of this amount have been brought into existence in the course of the present century. The price has not fallen with this new supply to the market, and, as in the case of the gold of California and Australia, it may be asked how this has happened, and the answer must be the same, that new sources of consumption have been found, increased wealth and population keeping the demand equal to the supply. The tin found in the island of Banca is very abundant and of a pure quality. It is cast into ingots weighing from 20 to 60 lbs; the purity of these bars is superior to those from the mines in Malacca. All that is of a superior quality which is brought to China in bars, is called 'Banca tin,' while the inferior is known as 'Straits tin.' Complaints have been made that both are adulterated with lead. The former sells for about £17 and the latter for £14 or 15 a pecul. In China the consumption of foreign tin has decreased during the last few years, and the annual importation does not now reach 5000 peculs. Tin plates are brought from England and America, in boxes containing 112 lbs. or from 80 to 120 plates, and sell for about £10 per box.

The alloys with tin are as under :—

1 oz. of tin to 1 lb. copper—a soft gun metal.
1½ „ harder, fit for wheels to be cut with teeth.
1½ „ to 2 oz. brass ordnance.
2 „ hard bearings for machinery.
2½ „ very hard do.
3 „ soft musical bells.
3½ „ Chinese gongs and cymbals.
4 „ house bells.
4½ „ large bells.
5 „ largest bells.
7½ „ to 8½ Speculum metal.

The tin alloy is scarcely malleable at 2 ounces; it soon becomes very hard, brittle and sonorous; alloys of 1½ cwt. to 2½ easily assume the maximum of hardness without being crystalline. Native smiths render the mixed metal malleable with greater proportions of tin; so do the Chinese for their gongs and cymbals, by gently striking it while hot at repeated heatings: some years ago, bronze sheathing for ships was prepared on the same principle. Natives call such malleable bell metal Akkansu, Tel. It is formed into vessels for containing acid food, buttermilk, &c.—*Horsfield on the Tin of Banca, Journ. of the Indian Archipelago, v. TINGEN. Tel. Phyllanthus, *sp.*

TINGERAN, or Tingoram River, on the east coast of the Malay peninsula, in lat. 4° 45′ N.

TING HAE, in lat. 26° 18′ N., long. 119° 50′ E. On the east coast of China, stands on the west side of a peninsula.

TING-HAE. A town and harbour on the south side of the island of Chusan, and fronted by many islands, between which are several channels leading to it. The city of Tinghae is 1 mile and 8 cables in circumference, and is surrounded by a wall 14 feet 9 inches high, and 13 feet wide, surmounted by a parapet 14½ feet high. A canal nearly 33 feet wide and 3 feet deep almost encircles the city and enters it near the south gate. Canals form the principal means of transport, the roads being merely foot-paths, and every large field has its own canal to convey its produce. Large quarries of hornstone porphyry are found in the N. W. extreme of the island. Salt, arrack, and mat manufactures occupy the people. During the month of September the thermometer in the shade ranged from 71° to 102°, its average height during the day being 85°.

The extract.

Sat Gulo. Hind. | Sat Gilo. Hind.

The root is covered with loose papery bark, and its wood is composed of distinct wedges separated by depressed medullary rays. It is used by natives for colds and fever, in doses of 6 mashas, in cold infusion, also in leprosy and skin diseases. Contains much starch and a bitter principle. It is a useful demulcent tonic, a substitute for calumba or cetraria in the treatment of dyspepsia also diuretic and febrifuge. Used in intermittent fevers, in which it is said only to diminish the cold stage; also in chronic rheumatism and debility after fever, and as a general tonic; but is said by some to be as powerful a febrifuge as Peruvian bark. The extract of the root is made by boiling the root 12 hours in water, then straining and removing the woody fibres, and evaporating the liquor to dryness. It is said also to be made by squeezing out the juice of the cut root, adding water, allowing it to stand, and collecting and drying the sediment. The substance is white, very brittle, in irregular lumps, and contains a large quantity of starch.—*Powell Hand Book. V.* 2 *p.* 325. *Roxb.* iii. 81. *Wight. Voigt.*

TINTA—— ? See Dyes.

TINTA. Sp. Ink.

TINTIREE, or Tintoore. Beng. Tamarind tree. Tamarindus Indica.

TIN-YOO-BEN. Burm. Pinus Khasyana. Pinus massoniana, *Lamb.*

TIPARA—?The Indian gooseberry. Physalis peruviana, *W.* In Persian it is called Urusah-dar-parda, "Bride in the veil," from the fruit being enclosed within a loose covering. It is grown in gardens, and is made into jam.

TIPATINGGE. Tel. Cocculus cordifolius, *D.C.*

TIPILE. Tam. Sing. Chavica Roxburghii, *Miq.*

TI-PLANT. Anglo-Burm. ? Dracæna terminalis.

TIPPA MANU. Tel. Tippa tige is Tinospora cordifolia, but the word Manu implies a tree.

TIPPA TIGE, or Guduchi. Tel. Tinospora cordifolia, *Miers.* Cocculus cordifolia, *D. C.* Menispermum cordifolia, *R.*

TIPPERAH, properly Tipura, is a district on the north-east of Calcutta. Its ancient name is Jajnagr or Yajnagr. A portion of it is under the government of a hindu rajah, the people being called the Tipperah hill men, and also the wild tribes on the eastern frontier, of whom the Kuki are most numerous. The language of the hill-men bears some resemblance to the Sanscrit. The language of Tipperah is Bengali with a large infusion of Urdu words. The mahomedans of the population are very numerous. Amongst the wild tribes it is said that in Mannipore, Cachar, and Assam, the offering of human sacrifices is still continued. By the records of the Sudder Nizamat Adalat of Chittagong for 1852, some men of the Toonia Joom mahals were tried for murder by sacrificing, This is a forest tract in the hills and inhabited by the Mug, Chukma, Reang, and Tipperah races, and others all more or less nomadic. The place of sacrifice was a cleared spot in the jungle, and staked round with bamboos about six feet high. The sacrificial pole is the Phula bans or bamboo, scraped and stripped at the edges, the hanging strips giving a rude notion of ornament. These sacrifices generally occur once a year During its celebration at Agartolla a gun is fired every evening at sunset, when every person hurries to his home. The Kuki and all the hill tribes worship local deities, said to be fourteen in number. The British Government has no treaty with Tipperah. Its rajah stands in a peculiar position, inasmuch as in addition to the hill territory known as "Independent Tipperah," he is the holder of a very considerable zemindary in the district of Tipperah in the plains; he receives his investiture from the British Government, and is required to pay the usual nuzzerrana. Tipperah zillah has the Megna river on its west and south. It extends from L. 22° 30′ N. to 24° N. In the Tipperah district of Bengal, the chief town is Comillah, 246 miles from Calcutta. The valley of the Surma is separated from that of Manipur by a meridional range of moderate elevation, which is continued to the southward, and separates Tipperah, Chittagong, and Arracan from the kingdom of Ava. Blue Mountain, which lies nearly due west of Chittagong, is said to attain the considerable elevation of 8,000 feet, and a peak on the same range forty miles to the south-west, in lat. 22°, is elevated according to Wilcox's map 3,100 ft. Sitakund, thirty miles north of Chittagong, has an elevation of 1,140 feet. The provinces of Tipperah and Chittagong are throughout hilly. The rainfall during the monsoon is about the same as in Bengal, at least on the sea-coast; and in its immediate vicinity, averaging 86 inches annually at Chittagong; on the higher ranges in the interior, it is probably much more considerable. Our knowledge of the flora of these provinces is chiefly derived from Roxburgh's 'Flora Indica;' many of the most interesting species published there having been communicated to him from Tipperah and Chittagong.—*Hook. f. et Thomson.* See India, Khum, Mru or Tung.

TIPPILI. SINGH. TAM. Chavica Roxburghii, *Miq.* Pepper, Long pepper.

TIPPILI MULAM. TAM. Pepper root.

TIPPOO SULTAN. A king of Mysore and son of Hyder Ali. Tippu was defeated by Lord Cornwallis on the 5th February 1792, and peace declared on the 23rd February. He was finally defeated by General Harris on the 27th March 1799, and was found dead amongst the slain, in the storming of Seringapatam, on the 4th May 1799. See Tepu; Tipu.

TIPREE DANCE. See Hooly.

TIR. The bank or shore of a river or sea.

TIRA. See Kohistan.

TIRAGADA PENDALAM, also Tiragali pendalam, also Nagali dumpa. TEL. A species of Dioscurea.

TIRAH and Chura are fertile and well peopled valleys, enjoying a cool climate in comparison with that of Peshawar; and it was not unusual for the sirdars and others, who had an understanding with the inhabitants, to pass the warm weather in the latter of these places; which also frequently became a place of refuge to the distressed. At Chura resided Khan Bahadar Khan, Afredi, who attained immense influence amongst his tribe from the circumstance of his attendance at court during the sway of the Sadoz Zye. Shah Sujah married one of his daughters to, and, on more than one occasion, found an asylum with, him. The Afredi occupy the eastern parts of the hills nearest Peshawar, and the Shinwari the western parts looking upon the valley of Jellalabad. The Orak Zye reside in Tirah, intermingled with the Afredi, and some of them are found in the hills south of Peshawar. It was a malek or chief of this tribe who conducted Nadir Shah and a force of cavalry, by the route of Chura and Tirah, to Peshawar, when the principal road through the hills was defended against him. The Shinwari, besides their portion of the hills, have the lands immediately west of them, and some of the valleys of the Safed Koh range. More westerly still, under the same hill range, they are found south of Jelalabad, and are the neighbours of the Khogani. These are in the condition of unruly subjects. There are also some of them in Ghor-band, and they dwell in great numbers bordering on Bajor to the north-west, where they are independent, and engaged in constant hostilities with the tribes of Bajor and of Kafiristan. See Khyber.

TIRAIMUM—— ? See Tugar.

TIRA KANA-MALAI MARAM. TAM. Tirkanamalay chettu, TEL. Berrya ammonilla, *Roxb.* Trincomallee wood.

TIREH, amongst the Afghans, means the branch of a tribe or firqah.

TIREH ? A small tribe in the Shinwari country, south of the Kabul river.—*Dr. Latham, p.* 197.

TIRGARI. See Kaffir.

TIRHAKAH, the Ethiopian, reigned in Egypt while Hezekiah reigned in Judea, Sennacherib in Assyria, and Mardoch Empadus in Babylon. The kings of Sais B. C. 697-523. He was followed on the throne by Necho I, then by Psammetichus I.—*Sharpe's History of Egypt, Vol. I. p.* 131.

TIRHUT, a district and town in Bengal. The Bengali language is derived from the Sanscrit, there being but few words in it not derived from that tongue, and Tirhuti on its north-eastern border has a great affinity with Bengali. But for this, the Bengali, from being the language of many millions of souls, and restricted solely to the geographical limits of Bengal, and from the cultivation which has been given to it, it well deserves to be ranked as a separate language. It is spoken by about ten millions of people in the Delta of the Ganges and to the west. Professor Muller mentions that nine-tenths of the Bengali and of the hindi tongues are composed of words taken from the Sanscrit. He regards it as the modern Sanscrit, standing to its parent, the old and classical Sanscrit, almost in the same relation as the modern high German to the old high German, as the modern Italian to the language of Rome. The people are less robust and of even a lighter yellow colour than those of Telingana. See Inscriptions. India, Surya-vansa, Topes.

TIRI. The chief town of Gurwal.

TIRITH. HIND. Worship. Thirtan Kara a worshipping priest, a pilgrimage of the hindoos or place of pilgrimage.

TIRI-PASS. See Kohistan.

TIRJUT. See Buddha.

TIRKHAN. HIND. A caste of carpenters, a carpenter.

TIRKU. HIND. Hippophae rhamnoides.

TIRMAL, also Tirmar. HIND. Xanthoxylon hostile.

TIRNI. HIND. Ficus Roxburghii.

TIRMUL. PUNJABI. Ficus macrophylla, *Clegh.*

TIRNI. A grazing tax. There are thul districts, of greater or less extent, in the various districts of the Punjab, and some of them chiefly valuable for the grazing they yield to large herds of cattle, who pay the "tirni" or grazing tax to Government.

TIRNI. Hind. Calliganum polygonoides, *Linn.*, also C. convolvulaceum.

TIRNOOT PATCHI VERI. Tam. Ocymum basilicum.

TIROONOOT OONDI. Tam. Ashes.

TIROOREE. Beng. Sinapis patens.

TIRTHA. Sans. Aplace of pilgrimage.

TIRTHAKAR. See Swastika. Tirith.

TIRTHANKAR. The generic title of the deceased saints, persons held sacred by the Jains, ee Jains.

TIRTYA YUG. See Rama. Vemana.

TIRU. am. An adjective signifying divine or sacred, prefixed to many names. In the south of India it is a prefix to holy places, as Tripatur, Tripatty.—*Wils.*

TIRUCHARNAM. Curcuma longa, also a yellow paste with which the forehead is marked.

TIRUCALLI. Tam. Tel. Euphorbia tirucalli. Milk-hedge plant.

TIRUGUKALLI. Maleal. Tam. also Tirugu jemudu, Tel. Euphorbia tortilis, *Rottl.*

TIRUKALYANA. Tam. Lit. the sacred or divine wedding, the name of a festival celebrated in honor of Iswara and Parvati, also of a festival celebrated in honor of Vishnu and Lakshmi.

TIRUKHU-KALLI. Tam. Euphorbia tortilis, *Rottl. W. Ic.*

TIRUKKAZ HUKKUNRAM, a temple 36 miles S. of Madras, well known to Europeans who visit it to see the kites fed at noon. The temple is now devoted to the worship of Siva, but an inspection of the inscriptions shows that it was once a jain edifice, and Taranathas, in his history, in Tibetan, of Indian Buddhism, mentions this temple under the mame of Paxitirtha or in the Tibetan corresponding name, Bird convent.—*Mr. Burnell or Inscriptions*, 1870, *p.* 6.

TIRUNAMA. The holy name. See Nama.

TIRUNIRU. The holy ashes. See Vibhuti.

TIRUNUR UNDAI. Tam. also Tirunut undi. Tel. Balls of cow-dung ashes.

TIRUPAD, a titular appellation of the native princes of Malabar, as the Tirupad of Nelambur.

TIRUPATI, or Tripati, in L. 13° 27′ N., L. 79° 26′ E. in the Carnatic, 4 miles N. of the Surnamuke. Level of the plain is 507 ft. *Ad. Schl.* See Tripati.

TIRUVACHAKA, a famous Saiva work,

TIRUVATTUR. See Hindu, Trivatur.

TIRWAH. Hind. A kind of peach of Candahar.

TIRWI. Hind. Ipomœa turpethum.

TIRYAQ FAROOQ. Ar.

Treiya phark, Ar. ? | Treeyaq or Tiriyaq, Hind. ?

This is the celebrated Theriaca Andromachi, of which the Tencrium chamædrys, the common germander, forms an ingredient. The words however are merely the Arabic for the best sorts of treacle, and this substance being esteemed in Baghdad as an antidote for snake bites, Tiryaq has come to be applied as a general term for antidote. The substance is in much request in Beri-beri. As met with in Ajmere, this is a black extract (most likely extract of henbane) of a narcotic odour: imported via Bombay, carefully packed in a small tin box: a powerful stimulant, and is given in a sort of convulsive disorder called "seet," catalepsy: one tola costs six or eight rupees.—*Genl. Med. Top. p.* 152.

TISE. See Kailas or Gangri Range.

TISHU LUMBU. See Bhutan, India.

TISHYA. See Asoka.

TISI. Hind. Flax; Linum usitatissimum, *Linn.*

TISKA. Can Antilope Arabica, *Hemprich.*

TISO. Hind. Carduus nutans.

TIT. Hind. Capparis aphylla.

TITA. Hind. Gentiana tenella.

TITA BATERI. Hind. Lonicera quinquelocularis.

TITAR. Hind. Rhus acuminata, R. succedanea. See Titri.

TITAR. Hind. The black partridge; any partridge.

TITHI, a lunar day, and also the anniversary of the decease of a parent, elder brother, &c. In hindoo reckoning of time those lunar days on which the sun does not rise (Suryo-duya nahin) are struck out; those in which it rises twice are Virdh, or additional; and since, according to the hindus, the Tithi is 22m. 31·9s. less than the mean solar day, it is obvious such circumstances will occur about once in 64 days, or six times in the course of the lunar year. The Tithi of each half month are named after the moon's age, as follows:—

1 Prathami or Pratipada.
2 Dwitya.
3 Tritiya.
4 Chaturthi.
5 Panchami.
6 Shasthi.
7 Saptami.
8 Ashtami.
9 Navami.
10 Dasami.
11 Ekadasi.
12 Duadasi.
13 Triadasi.
14 Chaturdasi.

The 15th from Shukla Pratapadi is Purnima, or Full Moon; and the 15th from Krishna Pratipada is Amavasya or New Moon. The hindu zodiac is divided into twenty-seven Lunar Mansions or Nakshatra of 13° 20′ each, probably originating in the revolution of the moon being performed in little more than 27 days.

TITHYMALOIDES. See Slipper plant.

TITHYMALES CYPARISSIAS. Syn. of Euphorbia cyparissias.

TITLES. In China, hereditary titles only exist for the Imperial family, and for the descendants of Confucius, who are still very numerous in the province of Changtong. In India, alike amongst hindus and mahomedans, titles are only hereditary amongst the rulers. See Dowlah.

TITMOUSE. The gray titmouse, Parus cinereus, represents the great ox eye of Europe; it is however a poor rival in point of brilliancy of feather, nor is his call note so clear and joyous ; it is, however, more familiar and may be constantly seen in Indian gardens: the black-crested titmouse, Parus melanolophus, somewhat resembles the marsh-tit of Europe. It is usually seen in flocks, and sometimes associated with another pretty species, the gray-backed tit, Parus dichrous, which is known by its brick-red iris ; the forehead and under the ear-coverts a dirty white ; upper parts grayish blue ; breast, belly, and vent, ochrey white.—*Adams.*

TITO-DOON-DOOL. BENG. Luffa amara.

TITO-KUNKA. BENG. Hoya viridiflora.

TITO-LAOO. BENG. Lagenaria vulgaris, also Cucurbita citrullus, *Linn.*

TITO-PAT. BENG. Corchorus acutangulus. C. capsularis.

TITRI. HIND. A generic name for the species of the genus Rhus. Rhus semialata, also R. buckiamela. Titri of the Chenab, R. acuminata, *DC.*, and R. cotinus.

TITSEIM. Terminalia bellerica, *Roxb.*

TITSINGH. See Kobo.

TITTA KOMMODU. SINGH. Colocynth.

TITTHA——? Cinnamon.

TITTHA-PAT. BENG. HIND. Corchorus capsularis.

TIUN. HIND. Artocarpus integrifolia.

TIURU. HIND. Rubia cordifolia.

TITO DHUNDHUL. BENG. Luffa amara, *Roxb.*

TIVAKSHER. SANS. Tabasheer.

TIVITI. See Kali.

TIVVA BENDA. TEL. A soft velvetty herbaceous creeping sp. Not described.

TIVVA MODUGA, or Tige moduga. TEL. Butea superba, *R.*

TIVVA MUSHIDI. TEL. Tilliacora acuminata, *Miers.* Cocculus acuminata, *W. & A.*

TIVVA POTIKE. TEL. Hugonia mystax.

TIWAJ. HIND. Wrightea antidysenterica.

TIWARI. A tribe of brahmans in northern India.

TIWUR. BOMBAY. Barringtonia acutangula, *Gærtn.*

TIYA. See Kali.

TIYAGARAIA SAMI. See Hindu.

TIYARI. Among the Tiyari of the Nestorians, the girls and women bathe unrestrained by the presence of men, in the streams or at the doors of their houses ; the men neither heed nor interfere ; their wives and daughters are virtuous.—*Layard.*

TIYAR. A race in Malabar, toddy-drawers and agriculturists.—*Wils.*

TIYYA MAMIDI. TEL. Mangifera Indica, *Linn.*

TIYYA MANDE, or Manchimande. TEL. Ceropegia bulbosa, *R.*

TIYYA NIMMA. TEL. Citrus limetta, *Risso and Poit.* Sweet lime. Madhura jambira, *W.*

TIZU. HIND. Cicer loongaricum.

TJARA. SW. Tar.

TJETTIK——? Strychnos tieute.

TJILATJAP is an island on the south coast of Java, at the eastern end of Kambagan. Its south point is in 7° 44′ 40″ S., and 109° 5′ 30″ E.

TJI-LI-WUNG, a river in Java, on which the town of Batavia is built.

TJIN. ARAB. Fig tree of Ficus carica.

TKENG-HIA. CHIN. Caryophyllus aromaticus, *Linn.*

TO. HIND. Triticum æstivum.

TOA. HIND. of Multan, a reservoir to receive the salt liquor in making saltpetre.

TOAD FLAX. See Linaria.

TOA-KHA-KYI. BURM. Chiretta.

TOARATTI MARAM. TAM. Capparis divaricata.

TOBA. A mountain range between 33° 40′ and 32° 40,′ and 66° 40′ and 68° 20′; length 150 m., extending N. E. from the N. side of Pisheen valley. The general elevation 9,000 ; above Pisheen, 3,500 feet. Tukatoo Hill, in 30° 20′ and 66° 55′, is 11,500 feet. Country, though generally rugged, is fertile. See Kandahar. Kelat.

Tobacco was introduced to Europe from America about the middle of the 16th century, and is now extensively cultivated in most parts of the world. The word is from the West Indies name for a peculiar tobacco pipe, tobogo or tobacco, and has been diffused with the product through Europe, Asia, Africa and the Eastern Archipelago. In the years 1860 to 1870, the tobacco seed of the Shiraz, Havannah, Manilla, and Maryland species and varieties were largely distributed throughout British India, but the East Indies have long possessed esteemed varieties of the various species of the genus Nicotiana, from species of which the tobaccos of the world are obtained. The value of the exports from British India, has been as under :—

1850-1	£.25,873	1856-7	£.37,962
1851-2	23,457	1857-8	58,336
1852-3	19,827	1858-9	45,307
1853-4	24,418	1859-60	37,656
1854-5	20,839	1860-61	29,783
1855-6	22,488		

The countries to which the shipments were made being very numerous, but Arabia, the Persian Gulf, Great Britain and America taking a somewhat large quantity. In the East Indies, the use of tobacco is very general. In the moist soft climate of Burmah, almost every person of both sexes and of all ages, smokes tobacco, even children, who are there suckled till they are two or three years old, are occasionally indulged with a whiff, and the general belief amongst physicians and educated non-medical men is that its use is useful as a narcotic stimulant, where there is much mental toil. In the several countries to which it has been brought from America, its introduction has, however, been opposed, and the opposition still continues, but its universal use shows that it supplies some want to the human body, or affords some gratification, which indicates a want; it has rarely caused injury, and its use is now believed to render alcoholic stimulants less requisite. Narcotics were once largely allowed to the prisoners in British Indian jails, under the impression that their use, in some shape or other, was essential to the preservation of life, in those who had from their youth upwards freely and continuously indulged in them. The Punjab, Lower Provinces of Bengal, and Madras, however, ruled that tobacco and opium can only be granted to the convicts at the express direction of the medical officer, and then only in curtailed quantities and for limited periods, in cases where the general health appears to suffer by their sudden and complete withdrawal from old *habitués*. In 1851, out of thirty-three Indian jails, tobacco was allowed to the prisoners in twenty-seven,and fears were entertained by the Bengal Medical Board and the Court of Directors if disused.The Bengal Board reported that from long and confirmed habit, tobacco smoking had with many adult convicts, become not so much a luxury as a necessary of life, comparable to salt and other condiments, which nature prescribes as indispensable adjuncts to meals. The Court of Directors also considered that discretion was necessary in withdrawing tobacco from persons who had always been in the habit of using it. Three years after the withdrawal of tobacco from prisoners in the Bengal Presidency had been accomplished, Dr. Mouat presented a report to the Government of Bengal, from which it appeared that of the fifty civil surgeons in charge of jails who had watched the effect of the order, thirty-three considered that the withdrawal of tobacco from the prisoners had not been attended with injury to health ; and fourteen gave undecided answers. Mahomedans, in a religious point of view, regard the act of smoking as an "act indifferent," being of the class of "biddate" things, which having come into existence after the death of the prophet, are therefore neither enjoined nor prohibited by him, and hence are accounted "indifferent." It is stated in the "Khulasat-ut-tawarikh," that tobacco was introduced into India by the Portuguese in the latter part of Akbar's reign, and the beginning of Jehangir's. Jehangir in the fourteenth year of his reign, when at Lahore, forbade the practise,—persons who smoked were to have their lips cut. Tobacco was introduced into Persia about the same time, during the reign of Abbas II. Several persons in Lahore, who contravened this order, were subjected to the process called "tashhir," i. e., riding on an ass with their face to the tail, and their visage blackened, this peculiar punishment being inflicted for infraction of imperial mandates. The "Makhzan-ul-adwiyah" says it was introduced by the Portuguese from the new world (Arz-i-jadid.)

Most of the tobacco of commerce, as that of Virginia, is yielded by N. tabacum, as also is that of India. N. latissima, *Muller*, and N. fruticosa are other species : N. Chinensis, *Fischer*, is the source of the large Havanna cigars. N. rustica, *L.*, indigenous in America and found wild in Europe, Asia and Africa, is the source of Latakia (Laodicea), Salonica (Thessalonica), Syrian and Turkey tobaccos : N. Persica, *Lindley*, is the Persian or Shiraz tobacco ; N. repanda, *W.* is the source of the small Havannah or Queen's cigars ; and besides these are the species N. quadrivalvis, *Pœst*, N. nana, *Lindley*, N. multivalvis, *Lindley*.

Tobacco, as it occurs in commerce, is of a deep yellowish-brown colour, soft and pliable, a little clammy, with something of a honey, mixed with a narcotic, odour ; the latter, however, is not obvious in the fresh leaves, The taste is bitter, acrid, and nauseous. Dr. Birdwood says that N. tabacum is cultivated in the Deccan, and N. rustica, northwards, also that N. Persica has been introduced into Bombay. The kinds of tobacco which are recognized in the Punjab are :

1st. Kandahari ; this is of a yellowish light color, and has small indentated leaves like an onosma ; with this kind of tobacco molasses or "gur" is not mixed ; but as it tastes sweet, there is probably a small quantity of honey mixed with it previously ; it is not twisted into any shape, but the broken leaf is left in little pieces. The stalk of the plant is used in this variety to make tobacco just as much as the leaves; in fact there is more stalk than leaves. Kakar tobacco is also grown at other places, and there is "Lahori Kakar," "Shikarpuri Kakar," &c. The kakar is known by its small size, and the leaves are more round than the others, which are long pointed.

2nd. Baghdadi: the seed of this is very much sought after by cultivators, on account of the abundance of the produce; it is not imported from the place whose name it takes, but probably came originally from thence.

3rd. Noki, so called from its pointed lanceolate leaves; of this there are two sorts, the noki, and the desi Panjabi.

4th. Lambli, a variety of which the leaves only are used, the woody stalk is of no use.

5th. Zarda; this is the best quality of tobacco, being of the kind called "noki."

6th. Purbi, from Hindustan, which is chewed with chunam, supari (areca nuts) and catechu (kath); it is also smoked—but it is expensive.

7th. Baingani, this is very uncommon at Lahore; it is so called because its leaves are shaped like those of the baingan, or Solanum melongena.

8th. Surati, from Surat and Bombay; it is strong and bitter like kakar.

In British India, the Surat, Bilsah, and Sandoway (Arracan) varieties of tobacco are the most celebrated. The two first are found to be good for cultivation in the districts about Calcutta, but the Cabool is still more to be preferred. Tobacco of Singour, in Burdwan, near Chandernagur, sells at the price of the Arracan sort, though of the same species as that cultivated in the surrounding country; and the best Bengal tobacco is grown at and about Hanglee, in the Kisnagar district. The tobacco of Chunar, on the Ganges and more especially that of Bhilsa, were celebrated throughout India, while, in Dr. Ainslie's time, the finest kinds in India, and perhaps in the world, were grown near the village of Woodanum, in the Northern Circars, and in some of those low sandy islands formed at the mouths of the river Krishna, (from this is made the famous Masulipatam snuff,) also in the Delta of the Godavery, where the soil is peculiarly rich and fertile, the product being known as Lunka tobacco. For Lunka cigars, a superior article, the Nicotiana rustica is now grown on the islets or "Lunka" of the Godavery, where the cultivation is rapidly increasing and is rather famous. The tobacco produced in India generally is complained of as too high dried and fit only for inferior kinds of snuff. The most celebrated in the Madras presidency appears to be the Trichinopoly and the Lunka. A high value was put on specimens of tobacco from American seed produced in Calcutta, and there appears the certainty that India can produce as good tobacco as America with the same care in the selection of situation, in cultivation, preparation, and packing. The value of good tobacco in the district of Masulipatam is from 10 to 15 rupees a candy of 500 lbs., or about ⅛*d.* per ℔. The best Lunka tobacco is from the Seetanagram island near Gootala, in the Godavery, and is sold usually at 40 rupees a candy on the spot. It increased to this price, within two years, from 15 Rupees. With the celebrated Shiraz tobacco of Persia (Nicotiana Persica), which is so much esteemed for the delicacy of its flavor, and its aromatic quality, the culture of the plant is nearly the same; it is only the preparation of the tobacco that forms the differ-

In December the seed is sown in a dark soil, which has been slightly manured (red clayey soils will not do.) To protect the seed and to keep it warm, the ground is covered with light, thorny bushes, which are removed when the plants are three or four inches high; nd during this period the plants are watered every four or five days,—only, however, in the event of sufficient rain to keep the soil well moistened not falling. The ground must be kept until the plants are six to eight inches high, when they are transplanted into a well moistened soil, which has been made into trenches for them; the plants being put on the top of the ridges ten or twelve inches apart, while the trenched plots are made so as to retain the water given. The day they are transplanted, water must be given to them, and also every five or six days subsequently, unless rain enough fall to render this unnecessary. When the plants have become from thirty to forty inches high, the leaves will be from three to fifteen inches long. At this period, or when the flowers are forming, all the flower capsules are pinched or twisted off. After this operation and watering being continued, the leaves increase in size and thickness until the month of August or September, when each plant is cut off close to the root, and again stuck firmly into the ground. At this season of the year, heavy dews fall during the night; when exposed to these the color of the leaves change from green to the desired yellow. During this stage, of course no water is given to the soil. When the leaves are sufficiently yellow, the plants are taken from the earth early in the morning, and while they are yet wet from the dew, are heaped on each other in a high shed, the walls of which are made with light thorny bushes, where they are freely exposed to the wind. While there, and generally in four or five days, those leaves which are still green become of the desired pale yellow color. The stalks and centre stem of each leaf are now removed and thrown away, the leaves are heaped together in the drying house for three or four days more, when they are in a fit state for packing. For this operation the leaves are carefully spread on each other and formed into cakes of sorts, the circumference from four to five feet, and three to four inches thick, great care being taken not to break or injure the leaves. Bags made of strong cloth, but thin and very open at the sides, are filled with these cakes, and pressed very strongly down on each other; the leaves would be broken if this were not attended to. When the bags are filled, they are placed separately in a drying house, and turned daily. If the leaves were so dry that there would be a risk of their breaking during the operation of packing, a very slight sprinkling of water is given them to enable them to withstand it without injury. The leaf is valued for being thick, tough, and of a uniform light yellow colour and of an agreeable aromatic smell.

Arracan tobacco.—When the excellent tobacco grown at Sandoway, in Arracan, was brought to London, it was valued at from 6*d.* to 8*d.* a pound. One of the results of Dr. Wallich's investigations was the bringing to notice some very superior tobacco, which obtained the name of Martaban tobacco. Dr. Wallich states, that the sort is from Arracan and not from Martaban; and describes it as having a fine silky leaf: tried by many people, it it had been pronounced the very best they had ever tasted, equal to, nay surpassing, the finest imported from Turkey and Persia. An extensive tobacconist said, 'a finer and better-flavoured tobacco he never saw or tasted in his life.' One of the first brokers in the City said, the sample of leaf tobacco is certainly of a very fine quality, and appears to have been produced from some peculiar seed and a greatly-improved cultivation and cure. By many manufacturers it was supposed to be from the seed of Havannah or St. Domingo tobacco. For smoking, it is compared with Maryland tobacco, having the same qualities, except the flavour, which is better, and more like Havannah. The colour and leaf are moreover, pronounced excellent for cigar-making; but if anything is against it for that purpose, it is the largeness of the principal stalk, and coarseness of the small fibres in the leaf.

Tennasserim tobacco is used in Burmah. The Karens raise it for their own consumption, and the Burmese both cultivate it and import it from Rangoon.

Ceylon.—Tobacco is cultivated with some attention and success by the Singalese of the western province, the Kandyans of the interior, and the Tamils of the northern districts of the island. In 1760, Ceylon produced a considerable quantity of tobacco, principally about Jaffna, a demand having sprung up for it in Travancore, and on the Malay coast. The cultivation spread to other districts of the island, Negombo, Chilaw, and Matura. Not long after the possession of the island by the British, a monopoly was created by an import duty of 25 per cent. ad valorem, and in 1811 the growers were compelled to deliver their tobacco into the Government stores at certain fixed rates. The culture and demand thereupon decreased. In 1843, the duty on the exports of tobacco from Ceylon amounted to £8,386, and in 1836 to £9,514. Ceylon now exports a considerable quantity of tobacco. The value of that exported in 1844 was nearly £18,000: it went exclusively to British colonies. The shipments since have been as follows:—

1848	£17,992	1851	21,422
1849	22,300	1852	20,531
1850	20,721		

Archipelago.—About 96,000 peculs of cigars, of five different qualities, are exported annually from Siam. Very fine tobacco is grown in the Philippines, and the Manilla cheroots are celebrated all over the globe. The quantity of raw tobacco shipped from Manilla in 1847 was 92,106 arrobas, each about a quarter of a cwt.; manufactured tobacco, 12,054 arrobas; and 1933 cases of cigars. 5,220 boxes of cigars were shipped from Manilla in 1844, 73,439 millions of cigars were shipped in 1850, and 42,629 quintals of leaf tobacco. The manufacture of cigars in Manilla is a monopoly of the Government of the closest description. The cheroot, which now costs, free of duty, about one halfpenny, could be rendered for half that sum. In Spain no person is permitted to have even the tobacco leaf in its raw state on his premises, and gendarmes pay, at stated intervals, domiciliary visits to the habitations of the people, in search of any contraband materials. There are several extensive manufactories of cigars and cheroots belonging to the government in and near Manilla. Mr. MacMicking, in his work on the Philippines, thus describes the mode of manufacture by those employed by the Government:—In making cheroots, women only are employed, the number of those so engaged in the factory at Manilla being generally about 4,000. Beside these a large body of men are employed at another place in the composition of cigarillos or small cigars kept together by an envelope of white paper in place of tobacco, these being the description most smoked by the Indians. The flavor of Manilla cheroots is peculiar to themselves, being quite different from that made of any other sort of tobacco; the greatest characteristic probably being its slightly soporific tendency, which has caused many persons in the habit of using it to imagine that opium is employed in the preparatory treatment of the tobacco, which, however, is not the case. The cigars are made up by the hands of women in large rooms of the factory each of them containing from 800 to 1,000 souls. These are all seated, or squatted, Indian like, on their haunches, upon the floor, round tables, at each of which there is an old woman presiding to keep the young ones in order, about a dozen of them being the complement of a table. All of them are supplied with a certain weight of tobacco, of the first, second, or third qualities used in composing a cigar, and are obliged to account for a proportionate number of cheroots, the weight and size of which are by these means kept equal. As they use stones for beating out the leaf on the wooden tables before which they are seated, the noise produced by them while making them up is deafening. The workers earn from six to ten dollars a month for their labor; and as that amount is amply sufficient to provide them with all their comforts, and to leave a large balance for their expenses and dress, &c., they are seldom very constant laborers, and never enter the factory on Sundays, or, at least, on as great an annual number of feast days as there are Sundays in a year.

The Japanese grow a good deal of tobacco for their own consumption, which is very considerable. They consider that from Sasma as better than that from Nagasaky, Sinday, &c. The worst comes from the province of Tzvngaru; it is strong, of a black colour, and has a disgusting taste and smell. The tobacco from Sasma is, indeed, also strong, but it has an agreeable taste and smell. and is of a bright yellow color. The tobacco from Nagasaky is very weak, in taste and smell perhaps the best, and of a bright brown color. The tobacco from Sinday is very good. The Japanese manufacture the tobacco well, and persons who cannot use other tobacco, can smoke that of Japan with pleasure.

Java.—The culture of tobacco in Java is very profitable, as the produce is obtained from grounds which have already yielded their first crop. The qualities of Java tobacco are more and more prized in the European markets; the preparation and assortment are not yet all that could be desired, but they have progressed in this branch, and the contracts made with the new adventurers assure them of a considerable benefit. But before the Java tobacco can hope to find an assured opening in the European markets, it will be necessary that the cultivators should make use of seed from the Havanna or from Manilla. The residencies of Rembang, Sourabaya, Samarang, Chinbou, and Tagal, present districts suited for its culture; it has been carried on with success for a good many years in the residencies of Treanger, Pakalongan, and Kedu, but only for the consumption of the interior, and of the Archipelago.

Celebes.—Tobacco is cultivated in Celebes, but merely in sufficient quantity for local consumption. It is exclusively grown by the Bantik population—the mode of preparation is the same as in Java; it is chopped very fine and mostly flavored with arrack.

Australia.—Tobacco is cultivated in New South Wales with much success. Australia produces a leaf equal to Virginia, or the most fertile parts of Kentucky, but the great difficulty is to extract the superabundant nitre. The first crop in New South Wales exceeds one ton per acre, and the second crop of the same plants, yields about half the weight of the first. In 1844 there were about 871 acres in cultivation in New South Wales with tobacco, and the produce was returned at 6,382 cwts.; but the impossibility of extracting the nitre by the heating, or any other process, rendered the flavor rank and disagreeable.

Amoor.—Tobacco is extensively cultivated in upper and lower Amoor.

In most of the countries of the East Indies, tobacco is smoked in the form of rolled cheroots or cigars or cigarettos, which are manufactured in large establishments. But most of the nations readily improvise a cigar, or pipe, by rolling the green leaf of a tree into the form of a cone and filling it as a pipe is filled. In Bengal, generally, and in Persia, the pure tobacco is rarely smoked; but various compounds are made and smoked in hookahs of various forms, the Nargyle or Argyle of Persia, the bubble bubble of British India generally, and the highly ornamental hooka. The nargyle is doubtless a word derived from "narel," a cocoanut, for the primitive form of huka is the "narel" or hubble-bubble, a hollow cocoanut shell half filled with water. On one side of the shell is inserted a pipe, which is connected with the fire pan and tobacco holder (chillam); and on the other side is inserted another tube, which goes into the mouth of the smoker. When the smoker draws, the smoke from the first pipe (the end of which is under water) is drawn up with a bubbling noise through the water, and is thus cooled and purified. The coil of flexible tube (necha) of the more elaborate hookah is made of long coil of iron wire covered with cloth and ornamented; this was invented in Akbar's time. A huka for smoking "madhau" (opium), with a peculiar shaped chillam is called "Madhaki." In the East Indies the lower orders frequently smoke in companies, with one "hubble bubble" or narel or "kalli," which are the most ordinary and cheap forms. All sitting round in a ring, the pipe passes from one to another, each taking a few whiffs as it passes. This is never done by the higher orders, nor is it done in Hindustan. The "sulfah" form of huka is the commonest in Kabul and Peshawar. Voigt enumerates 15 species.

Loudon's Encyclopædia of Plants enumerates fourteen species of Nicotiana, besides varieties.

a. N. tabacum, a native of several parts of America, but principally known as Virginian tobacco, having a stem rising from four to six feet, or more in height, bearing pink flowers. Of this there are three chief varieties known in America by the popular names of Orinoco, Broad-leaved and Narrow-leaved, but Lindley even enumerates eight varieties of N. tabacum.

b. N. macrophylla or large leaved tobacco, an ornamental annual, with pink flowers, native of America, rises to the height of six feet.

c. N. fruticosa, or shrubby tobacco, an ornamental evergreen shrub, native of China, pink blossoms, grows to about three feet.

d. N. undulata, or *suaveolens*, sweet-scented or New Holland tobacco, a green house perennial, native of New South Wales, with white flowers, only two feet high.

e. N. rustica.—The common green or English tobacco, an annual plant, native of America, producing white flowers, which seldom grows higher than three feet.

f. N. paniculata, or panicled tobacco, an annual plant bearing greenish yellow flowers, native of Peru, rises to three feet high.

g. N. glutinosa or clammy-leaved tobacco, an annual plant, native of Peru, growing to the height of four feet, with bright scarlet flowers.

h. N. plumbaginifolia, or curled-leaved tobacco, an ornamental deciduous annual, native of America, with white blossoms rising to the height of two feet.

i. N. pusilla, or primrose-leaved tobacco, an ornamental deciduous biennial, white flowers, native of Vera Cruz, rising to three feet.

j. N. quadrivalvis, four-valved; or Missouri tobacco, an ornamental annual, native of North America, with white flowers, seldom growing higher than two feet.

k. N. nana, or Rocky Mountain tobacco, a curious greenhouse annual, native of North America, white blossoms, only three inches high.

l. N. Langsdorffii, or Langsdorff's tobacco, an ornamental annual, greenish yellow flowers, native of Chili, reaching five feet high.

m. N. Cerinthoides, or honey wort tobacco, an ornamental annual, with greenish yellow flowers, native country unknown.

n. N. repanda, Havanna tobacco, an annual with white flowers, native of Cuba, rising two feet high.

There are a few species, natives of the Province of Buenos Ayres, which may be particularised. *N. banariensis*, having white flowers; *N. glauca*, yellowish green flowers; *N. longiflora*, white flowers, and *N. viscosa*, pink flowers.

The important mineral substances present in Havanna tobacco, examined by Hertung, are in 100 parts of ashes,

Salts of potash, ...	34·15
Salts of lime, ...	51·38
Magnesia, ...	4·09
Phosphates, ...	9·04

These substances being for the most part insoluble in earth, must have been dissolved during the growth of the crop.

Analysis of five samples of tobacco.

Phosphate of lime ..	1·49
Sulphate of lime	6 35
Silica..	8·01
	100·00

All the ingredients which are necessary to replace 100 lbs. of the ash of tobacco leaves are present in the following mixture:—

Bone dust, sulphuric acid	23lbs
Carbonate of potash (dry)	31 ,,
Carbonate of soda (dry)	5 ,,
Carbonate of Magnesia	25 ,,
Carbonate of lime (chalk)	60 ,,
	144 lbs.

Dr. Covell, in "Silliman's American Journal," vol. vii., shows the components of the fresh leaves of tobacco to be—1, gum; 2, a viscid slime, equally soluble in water and alcohol, and precipitable from both by subacetate of lead; 3, tannin; 4, gallic acid; 5, chlorophyle (leaf green); 6, a green pulverulent matter, which dissolves in boiling water, but falls down again when the water cools; 7, a yellow oil, possessing the smell, taste and poisonous qualities of tobacco; 8, a large quantity of a pale yellow resin; 9, nicotine; 10, white substance, analogous to morphia, soluble in hot, but hardly in cold alcohol; 11, a beautiful orange red dye stuff, soluble only in acids; it deflagrates in the fire, and seems to possess neutral properties; 12, nicotianine. According to Buchner, the seeds of tobacco yield a pale yellow extract to alcohol, which contains a compound of nicotine and sugar. MM. Henery and Boutron Charlard found the following quantities of nicotine in 100 parts of

Cuba tobacco.	8·64	Ile et Vilaine..	11·20

—*Ure's Dictionary of Arts and Manufactures.*

Mr. Piddington analysed several Indian soils, distinguished for the production of superior tobacco. These are soils from Arracan, (Sandoway,) a soil from Singour, in Burdwan, near Chandernagore, the tobacco of which, though of the same species as that of the surrounding country, sells at the price of the Arracan sorts; and the soil of the best Bengal tobacco, which is grown at and about Hingalee, in the Kishnagur district. The best tobacco soils of Cuba and Manilla, are for the most part red soils, which contain most of their iron in the state of peroxide, or the reddish brown oxide of iron; while the lighter grey soils contain it only in the state of protoxide, or the black oxide of iron. Mr. Piddington believes the quality of the tobacco to depend mainly on the state and quantity of the iron of the soil, while it is indifferent about the lime which is so essential to cotton. None of the tobacco soils contain any lime. Their analysis show them to contain in 100 parts

	Arracan.	Singur.	Hingalee.
Oxide of iron (peroxide)	...15·65	10·60	6·00
Water and saline matter	... 1·10	·75	1·50
Vegetable matter and fibre	... 3·75	1·10	·75
Silex	...76·90	80·65	87·25
Alumina	... 2·00	4·50	1·15
Water and loss ..	... ·60	2·40	3·00

From which it will be seen that the best tobacco soil hitherto found in India contains about sixteen per cent., or nearly one sixth, of iron, which is mostly in a state of peroxide; and that the inferior sort of tobacco grows in a soil containing only six per cent., or one sixteenth of iron, which is, moreover, mostly in the state of protoxide, or black oxide. He also examined the quantity of iron in the different sorts of tobacco, and found that while the ashes of one ounce, or 480 grains of Havanna and Sandoway cheroots gave exactly 1·94 grains, or 0·40 per cent. of peroxide of iron, the ashes of the same quantity of the Hingalee, or best Bengal tobacco, only gave 1·50 grains, or 0·32 per cent; and it appears to exist in the first two in a state of peroxide, and in the last as a protoxide of iron; rendering it highly probable that the flavour of the tobacco to the smoker depends on the state and quantity of the iron it contains. Green copperas water, which is a solution of sulphate of iron, is often used by the American and English tobacconists and planters, to colour and flavor their tobacco; and this would be decomposed by the potass of the tobacco, and sulphate of potass and carbonate of iron formed. Carbonate of iron is of an ochre-yellow colour. Mr. Laidley, of Gonitea, however, dissented from the idea suggested by Mr. Piddington that ferruginous matter in the soil is essential to the successful growth of tobacco. He observed that tobacco contains a notable quantity of nitrate of potass and muriate of ammonia (the latter a most rare ingredient in plants), and these two salts are infinitely more likely to affect the flavour of the leaf than a small portion of oxide of iron, an inert body. Now as neither of these can be supplied by the atmosphere, we must search for them in the soil, and accordingly he imagined that a compost similar to the saltpetre beds which Napoleon employed so extensively in France, would be a good manure for tobacco lands; namely, calcareous matter, such as old mortar, dung, and the ashes of weeds or wood.

Natives of India grow the tobacco (each for his own use) upon the heap of rubbish at his own door, consisting of ashes, cow-dung, and offal of all kinds. In Coimbatore, between the middle of August and the same time in September, a plot of ground is hoed and embanked into small squares; in these the seed is sown, and covered by hand three times at intervals of ten days. To secure a succession of seedlings water is then given, and the sun's rays moderated by a covering of bushes. Watering is repeated every day for a month, and then only every fifth day. The field in which the seedlings are transplanted, is manured and ploughed at the end of August. Cattle are also folded upon the ground. Four or five ploughings are given between mid September and the middle of October, when the field is divided as above into small squares. These are watered until the soil is rendered a mud. Plants of the first sowing are then inserted at the end of September, about a cubit apart, the transplanting being done in the afternoon. At intervals of ten days the seedlings of the other two sowings are removed. A month after being transplanted the field is hoed, and after another month the leading shoot of each plant is pinched off, so as to leave them not more than a cubit high. Three times during the next month all side shoots thrown out are removed. When four months old, the crop is ready for cutting. To render the leaves sweet the field is watered, and the plants cut down close to the surface, being allowed to remain when cut until next morning. Their roots are tied to a rope and suspended round the hedges. In fine weather the leaves are dry in ten days, but if cloudy they require five more days. They are then heaped up under a roof, which is covered with bushes and pressed with stones for five days. After this the leaves are removed from the stems, tied in bunches, heaped again, and pressed for four days longer. They are now tied in bundles partly of the small leaf and partly of the large leaf bundles, and again put in heaps for ten days—once during the time the heaps being opened and piled afresh. This completes the drying. A thousand bundles, weighing about 570 lbs., is a good produce for an acre in the East Indies for its growth, a soil as fertile and as well manured as for the prduction of the poppy or opium. It is, therefore, often planted in the spaces enriched by animal and vegetable exuviæ, among the huts of the natives. Growers in Cuba, Virginia, North and South Carolina, and the Philippine Islands select a high and dry piece of land, of a siliceous nature, and combined with iron, if possible; tobacco will even lose its natural quality and degenerate by transplanting from one soil to another, although of the same temperature, and *vice versa.*

In the year 1842, 605,000,000 of cigars were made in the German Commercial Union. In 1839, the revenue on tobacco in Great Britain was about £3,600,000. Of this it has been estimated eleven-twelfths are drawn from the working classes, and one-twelfth from the richer classes. The following is a calculation of the consumption of tobacco per head of the population, estimated from the number of pounds on which duty was paid :—

	Rate of duty.	Consumption per head. oz.
1801.........	1s. 7 3-10d. England. 1s. 0 7-10d. Ireland.	 17
1811.........	2s. 2 13-20d.	...... 19¼
1821.........	4s. 0d.	...... 11 45
1831.........	3s. 0d.	...... 12 35
1841.........	3s. 1 8-10d.	...... 12 45
1851.........	3s. 1 4-5d.	 21

Thus it will be seen the consumption is materially affected by the rate of duty.

The imports to England of all kinds of tobacco for the five years, 1848 to 1852, have been as follows :—

	1848.	1849.	1850.	1851.	1852.
	lbs.	lbs.	lbs.	lbs.	lbs.
Unmanufactured...........	34,090,360	41,546,848	35,166,358	31,061,953	33,205,635
Manufacture and snuff...	1,512,714	1,905,306	1,557,518	2,331,886	2,930,299
	35,603,074	43,452,154	36,723,876	33,393,839	36,135,934
Gross duty received :—	1848.	1849.	1850.	1851.	1852.
	£	£	£	£	£
On raw tobacco...........	4,267,579	4,328,217	4,337,258	4,386,910	4,466,533
Cigars, snuff, &c............	97,655	96,814	92,873	98,858	94 298
	4,365,234	4,425,031	4,430,131	4,485,768	4,569,831

In the year 1850, it was estimated that the produce of tobacco in the whole western states of N. America, was about 160,000 hhds, or 104,000 tons. In that year the following quantities of unmanufactured tobacco, manufactured called negro-head, and cigars, were imported into the United Kingdom of Great Britain :

Countries from whence imported.		Unmanufactured.	Manufactured.
United States of America...	lbs.	30,173,444	1,191,001
Venezuela, New Grenada and Ecuador		895,623	527
Brazil		12,138	56,802

Ditto manufactured ... lbs.	1,556,321	
Snuff ...	1,197	
Total... lbs.	36,723,876	

The consumption in Great Britain in that year was estimated at 26,000 tons, and of the imports from 1847 to 1850, from 4988 to 7348 tons were re-exported in the form of tobacco leaf and cigars.—*Poole's Statistics of Commerce. Ure's Dictionary, Madras Exhibition Juries' Reports, Catalogue of London Exhibition of* 1862. *Royle's Illustrations Him. Botany. McCulloch's Commercial Dictionary. Bengal As. Soc. Journal. Mr. Rohde MSS. Simmond's Commercial Dictionary. Powell Hand-book of the Panjab. Birdwood, Vegetable Products.*

TOBAGO CANES. This walking stick is a product of a palm, the Bactris minor, Jacq., a native of New Granada and the West Indies.—*Seeman.*

TOBAK, DAN. Tobaka, Pol. Tobacco.

TOBACCO SEED OIL. Oils of Nicotiana tabacum and T. rustica.

TOBBA was the hereditary title of the ancient kings of Yemen. They seem to have been as useful to the Arabian antiquaries as the Phœnicians to ours. Samarkand was said to have been built by them, and a Himyarite inscription on one of the gates testifies thereunto. See d'Herbelot.—*Yule Cathay. I. p.* 190. See Aboo Karib. Kaba.

TOBBA-UL-AKRAN. See Samarcand.

TOBICA WOOD. Tobica karra, TEL. A wood of Northern Circars.

TOCHARI, a nomade Scythic or Tartar tribe supposed by Lassen to be the Yeu-tchi or Yu-chi or White Huns, and he places them with their Arian kings in Upper Bactria and Soghdiana. Towards the end of the second century before Christ they consisted of five tribes. See Kabul. Afghan.

TOD, COLONEL. Many years Resident at Udipur, in Rajputana; he devoted his life to the collection of the traditions, legends, genealogies and literature connected with the Rajput race among which he was placed. He published the result of his inquiries in two very interesting quarto volumes, which contain some beautiful illustrations of Rajput scenery and architecture.

TODAH, also styled Todar, Todawar or Torawar, a race occupying the Neilgherry hills in the southern part of the peninsula of India, and seemingly the earliest occupants of those mountains. The name is a Tamil word signifying a herdsman which is the avocation of this race. The Todah, Kotah, Badaga, Erular and Kurumbar, are the names of the tribes now occupying the Neilgherry hills. The dialects spoken by them are mixtures of Canarese and Tamil, and differ chiefly in the pronunciation, therefore, the same or nearly the same word in the mouth of a Todah, with his pectoral pronunciation, can scarcely be recognised as the same in the mouth of the Kotah, with their dental pronunciation. The Badaga and Kurumbar dialects are midway between the former two, with regard to pronunciation. Amongst the several Badaga tribes, those who came at a later period to the hills, the "Kangaru" (Lingait), for instance, who emigrated from Targuru, speak a purer Canarese than the common Badaga. The Todah tribes are five, viz. Peikee, which is the chief tribe, Kenna, Pekkan, Kuttan, or Todi. They are idle, dirty, intemperate and unchaste. Infanticide and polyandry has always existed among them, and their women are now addicted to general prostitution with men of other races. The Todahs formerly allowed one female child to live in each family, the rest being strangled, but this has been put a stop to. They are generally described as a tall and handsome race, but the averages of 25 men and 25 women were as under,

	Men.	Women.
Height ... ... inches	63·30	60·25

The women are tatooed about the arms, chest and legs; both sexes wear as their sole costume, for day or night, a toga of stout cotton cloth, five pounds in weight. It is thrown across the right shoulder, overlaps the left arm and trunk, and descends to the knee. They wear no head covering, and their feet are always bare. The women wear brass and iron ornaments, bead and shell neck laces. They carry no weapon, their sole support being their shepherd's staff.

The women are treated with respect, do only household indoor work, and at their leisure work in embroidery. The young associate together before marriage, and on marriage the women become the wives of all the brothers into whose families they marry, the children being apportioned to husbands according to seniority. A Todah bride is brought to her husbands' dwelling, who each puts a foot on her head; she is then sent for water. Their principal deity is Hiria-deva, or the Bell-god, a sacred buffalo bell: this is suspended to the neck of their best buffalo, which is considered sacred, and is worshipped with libations of milk and prayers. Their “Hunting god” is implored for success in their hunting expeditions, and the sun is worshipped as a deity. They believe in the transmigration of souls, called Huma-Norr, and they are very superstitious. Their cemetery and place of funeral sacrifice is a pretty green spot, partially enclosed by a stone wall, and rendered very gloomy by a thick wood on one side and lofty hills on the other. It is their practice to sacrifice buffaloes on the demise of a Toda, and a strongly walled area is set apart for the reception of these animals whose bones and horns are strewed on the ground. At the demise of a Toda chief, the funeral procession entered the green and moved towards the centre. The deceased was dressed in a new garment and mantle, and arrayed in all the ornaments which he had worn during life. He was carried on a bier formed of branches and herbs, and followed by a number of mourners, male and female, who chanted the lament whilst others carried wood for the funeral pile and provisions for the evening meal. The herd of buffaloes was driven into the walled area, and the men armed with clubs entered with exulting shouts and performed a wild dance amongst the buffaloes. These soon became excited to the highest pitch, and at a signal, a bell was attached to the neck of each infuriated animal. Two young men would throw themselves on the animal's neck, seize it by its horns, others would run to their assistance, and eight or ten men would be seen hanging on the neck of one animal, whilst others increased its rage by blows of their clubs, and goading it on with hideous yells and gestures. Three or four animals were thus attacked at one time, and the bell attached to the neck of each. But meanwhile the general assemblage which lined the walls were weeping, exulting or sending forth shrieks of horror whenever a man was wounded, a buffalo overpowered, or a lover or a husband in imminent danger. On the next day, the victims were finally sacrificed. The men struck the animals behind the horns with a wood cutter's axe. But sometimes the blow was undecisive, and an animal infuriated escaped and drove madly amongst the multitude. After the sacrifice, several wild dances followed, during which the men feigned to cut and lacerate themselves. On the third day, the deceased was burned on the funeral pile. They do not at present number more than from 300 to 500 souls. It is supposed that they never could have exceeded a few thousand, but have diminished through opium eating and polyandria, and, at a former period, the prevalence among them of female infanticide. The Toda is the oldest indigenous speech on the Hills. See Dravidian.

TODAKATTI MARAM. Tam. See Todacuttie wood.

TODAPAM. Tam. Brooms. Broom grass.

TODAH. Hind. also Kotakah, a kind of land built into terraced fields.

TODACUTTI WOOD. A beautiful, hard and compact wood, in some parts of the country called Nookoo marum, occasionally employed for making escretoires, cabinets, &c. &c.—*Ains. Mat. Med.* p. 207.

TODAR MULL, the hindu minister of Akbar, a great financier: under his advice Akbar lightened the burdens that pressed on agriculture, abolished the capitation tax on the hindus, abolished also the tax on religious assemblies and other imposts that weighed on the population. Akbar had early to subdue a revolt of his own army, which he effected by an army of rajputs under Todar Mull. His Afghan soldiery serving in Bengal subsequently revolted, and against them he sent his near relation Man Sing, who, after twelve pitched battles and seventeen years of conflict, completely established Akbar's authority there. Akbar's brother-in-law, the rajah of Jeypore, afterwards conquered Cashmere. In Akbar's next efforts to curb the Euzufzye and Khyberi highlanders around Peshawar, his army of 40,000 under his foster brother rajah Berbul, was completely destroyed and Berbul slain, and his subsequent efforts under Man Singh and Todar Mull only met with a partial success. Akbar next annexed Sind and reconquered Candahar, and after 25 years of warfare, he was the undisputed possessor of the territories north of the Nerbuddah.

TODAVADI. Maleal. Oxalis sensitiva, *L.*

TODDALIA, a genus of plants belonging to the natural order Xanthoxyalacæ. The name Toddalia is derived from Toddali, the Tamil name of one of the species. An inferior cosmetic wood or cosmetic tubercles is seen in the Tenasserim market, which is the tubercle of some plant, probably Toddalia aculeata or T. floribunda. The Burmese appear, from their name, to regard them as produced by a species of erythrina, for they call them "erythrina thorns;" but Mr. Mason knows the plant to be a creeper, and suspects that it is of the above genus.—*Eng. Cyc. Mason's Tenasserim. Voigt*

This plants has prickly stems and branches, is one of the most common bushes on the coast of Coromandel, and extends to 30° N. lat., along the base of the Himalaya mountains. All the parts are very pungent, especially the roots when fresh cut. The fresh leaves are eaten raw for pains in the bowels; the ripe berries are fully as hot as black pepper, and have nearly the same kind of pungency. They are pickled by the natives. The fresh bark of the root is administered by the Telinga physicians for the cure of the remittent, called hill fever. Roxburgh conceived that this tree possessed very valuable stimulant properties, and Dr. O'Shaughnessy is of the same opinion, though he does not appear to have ever made any experiment with it. In fact, nothing has been added to what Roxburgh knew, although some specimens of the bark were sent to Europe in 1818. Its properties are worthy of further investigation.—*Roxb.* i. 616. *Ind. Ann. Med. Sci. for April* 1856. *Eng. Cyc. O'Shaughnessy p.* 265. *Beng. Phar. p.* 433. *Dr. Mason's Tenasserim. Voigt. p.* 186. See Cosmetic tubercles, Mulukarang vare patte.

Toddy,	,,	Sura, Tari, Tadi,	SANS.
Sendi, of date palm	HIND	Khullu	TAM. TEL.
Tari, ,, palmyra ,,	,,		

Toddy is the general name given by Europeans to the sweet, delicious, refreshing liquors which are procured in the tropics, by wounding the spathes or stems of certain palms when the sap and juices exude from the trunks or from the fruit stalks. In the West Indies, it is obtained from the trunk of the Attalea cohune, a native of the Isthmus of Panama. In Eastern Asia, the palms from which it is collected are the Gomuti palm, the Cocoanut, the Palmyra, the Date, and the Kittul or Caryota urens. The Gomuti palm, *Arenga saccharifera*, is fit to yield toddy when nine or ten years old, at the average rate of three quarts a day. On the first appearance of the fruit, one of the spadices is beaten with a short stick, on three successive days, with the view of determining the sap to the wounded part. The spadix is cut off a little way from its root or base, and the liquor, which oozes out, is received in pots of earthenware, in bamboos, or other vessels. When newly drawn, the liquor is clear, and in taste resembling fresh must. In a very short time it becomes turbid, whitish, and somewhat acid, and quickly runs into the various states of fermentation, acquiring an intoxicating quality. In Malacca, the Gomuti, termed Kabong, comes into bearing after the seventh year. It produces two kinds of "Mayams" or spadices,—male and female. The female spadix yields fruit, but no juice, and the male the reverse. To procure the toddy of the palmyra tree, the Borassus flabelliformis, at the season when the inflorescence begins to appear, and before the spathes have had time to burst, the toddy-drawer cuts off all leaves except three or four, and all or most of the spathes are effectually encompassed from end to end by thongs, to prevent the inflorescence from bursting forth. When thus tied for three successive mornings they are beaten or crushed between the wooden battens, with the object of keeping them from bursting, and to encourage the flow of sap. On the fourth morning, a thin slice is cut from the parts of the spathes. On the eighth morning a clear sweet liquor begins to flow from the wounded parts, and the toddy-drawer then ascends in the morning with chatties, or toddy receivers, in which he places the ends of the spathes, and leaves them until the morning, when they are found to contain a quantity of this liquor. The operation of attracting the juice is repeated every morning or evening until the whole spathe is sliced away. The trees are drained in this manner for several months of the year, seven or eight spathes yielding at the same time.

The toddy of the cocoa-nut tree (Cocos

nucifera) is obtained from the flower spathes before the flowers have expanded in a manner almost similar to what has been described of the Palmyra palm. The spathe is tied with strips of the young leaves, to prevent its expansion; it is cut a little transversely from the top, and beaten either with the handle of the toddy knife or a piece of hard wood, a process which is repeated morning and evening for five or six days in succession. The under part of the spathe is then taken off, to allow of its being bent, in which position it is retained by being attached to a leaf stalk below. An earthen pot or leaf basket, is a few days afterwards attached to the end, and is every morning and evening emptied of the toddy which exudes into it, the quantity of which greatly varies. A little portion of the spathe is daily cut off.

Toddy is also procured from the date tree of India, Phœnix dactylifera during the months of November, December, January and February, during which period each tree is reckoned to yield from 120 to 240 pints of juice; but the mode of its extraction destroys both the fertility and the appearance of the tree. After removing the lower leaves and their sheaths, a notch is cut in the pith of the tree near the top, from which the toddy issues by a small channel, made of a bit of the palmyra leaf, into a pot suspended to receive it.

Palm wine is also extracted from the Caryota urens during the hot season. The quantities which are said to flow from it are immense, so much as a hundred pints during the twenty-four hours.

The taste of toddy in its fresh state, probably varies according to the state of the weather and season of the year, which will explain the many comparisons given of it, to Poubon water, mild champagne, cider, ginger beer, perry, &c. In all Eastern countries the toddy of these several trees is used for the same purposes. It is drunk, though rarely, when fresh from the tree, and is then a gentle aperient, particularly useful in delicate constitutions. It is boiled down into a coarse sugar called jaggery or goor, which is afterwards refined. It is fermented in the course of a day, into a mildly intoxicating liquor, still known as toddy, of which several pints are partaken before intoxication comes on. It is also distilled into arrack, made into vinegar, and throughout all Eastern countries it is employed as yeast as it begins to ferment in a few hours after it is drawn. In the peninsula of India the ropes employed by the toddy-drawers to help them to climb the tree, are made of cow or buffalo hide, but in other countries the pliant tendrils of plants are sometimes employed. The ropes are sufficiently large to surround the tree and the body of the climber, who by leaning backwards and throwing his whole weight on the rope, is thus enabled to retain each position he attains, while by drawing up his feet and shifting the thong in his hand to higher points, he gradually raises himself to the top of the tree. Accidents, however, are frequent and frightful. The toddy from the cocoanut tree, the date, and the palmyra, is called Nira, Sendi, Tari, in DUK. GUZ. HIND. respectively.

TODDY-BIRD. Artamus fuscus.

TODDY-CAT. One of the Viverridæ.

TODDY DRAWER. In Tamil, Sanar; in Malabar, Kattikaran; in Karnatica, Idiga; in Tamil, Sarai-kara; in Telugu, Kalal; is a person who manufactures and sells toddy and other spirituous liquors. In Mysore the toddy-drawers are the Hale Paik race, who speak Tulu.—*Wils.* See Polyandry.

TODDY SHRIKE. Artamus fuscus.

TODRI. HIND. Varieties of Cheiranthus, Todri safed is C. annuus, T. surkh or lal, Cheiranthus cheiri. Todri nafarmani is a Delphinium. Todri surkh, is apparently the seeds of common cress (Lepidum sativum), but in all probability mistakenly, as all other specimens of cress are named halim, or taratezak.

TODRI LILA, also Todri safed. HIND. Mathiola incana.

TOGARU. TEL. Morinda exserta, *R.* i. 545. Wood hard and useful, does not warp, grows to a good sized tree, in the Godavari forests.

TOGHALUK. Feroz Toghaluk, king of Delhi, invaded Sind A. D. 1361, and was opposed by a prince whose title was Jam. The Jam brought 40,000 infantry and 20,000 cavalry into the field, and for two years and a half kept the king of Delhi at bay. On the brow of a precipice overlooking the northern end of the wall, are the ruins of the stupendous fort of Toglukabad. The vast dimensions, bulk and weight of the stones employed in them, called forth from Bishop Heber the remark that 'the Patans built like giants, and finished their work like jewellers.' In the words of Sleeman, 'the impression left on the mind after going over the ruins of these stupendous fortifications is, that they seem to have been raised by giants, and for giants whose arms were against everybody, and everybody's arm against them.' The fort of Toglukabad was commenced in A. D. 1321, and finished in 1323, or in the short period of two years. Of all the mahomedan fortresses, that of Toglukabad was the greatest and most important in India. The fine tomb of Togluk Shah, built by his son Mahomed, is situated outside the southern wall of Toglukabad, in the midst of an artificial lake, and is surrounded by a pentagonal out-work which is connected with the fortress by a causeway 600 feet in length, supported on twenty-seven arches. The stern beauty and massive strength of the tomb, combined with the bold and massive towers of the fortification that surround it, form a picture of a warrior's tomb. It may be that the splendid mausoleum was an atonement for parricide; for the fall of the wooden pavilion which crushed old Togluk Shah was doubtless a contrivance of his son and successor, Johna Mahomed. The monarch reposes by the side of his queen; near them lie the ashes of the parricidal son. Togluk Shah introduced the era styled the Shaboor san.—*Tr. of Hind, Vol. II, p.* 214.

TOM. Javanese. Indigofera tinctoria.

TOMAGARIKA. Tel. Sporobolus tenacissimus, *Beauv.* Agrostisten. *R.* i. 316.

TOMAN. When Tavernier visited Persia in the 17th century, the toman was worth more than £3; since then it has gradually diminished in value. When Sir J. Malcolm wrote his history of Persia about the year 1820, it was worth £1; it is now worth about nine shillings. Twenty rupees make a toman in Herat, which is equal to six rupees and twelve annas of India (or about 13s. 6d.) The toman of the Dushtistan is equal to 16 Persian rupees, and one mahomedee; each rupee 7 mahomedee; each of which in turn contains 8 pool-e-siah (black money, a certain copper coin); consequently a toman contains 904 pool-e-siah.

TOMAR, also Tokar, Hind. Triticum æstivum.

TOMATO, or love apple, the Solanum lycopersicum, is a vegetable of easy culture, does not require a very rich soil, succeeds best when trained on horizontal trellises, should be thinned occasionally of superfluous shoots, raised from seed, used in sauces, &c.—*Jaffrey.* See Love apple. Solanum. Vegetables.

TOMAYOKE. Burm. Rondeletia tinctoria.

TOMBACCO. It. Tombak. Ger. Tomback. Dut. Pinchbeck.

TOMBS. The tombs of mahomedans have usually been of earth, or unbaked brick, but every material is employed, and names even are written on the tombs. The tomb-stone of a man is distinguished by a raised part in the centre, and that of a woman by a depression. The prevalent form in India of mahomedan tombs of the wealthy, is a dark or black tomb-stone with verses of the Koran engraved on it, and covered by a cupola. Some of these are very magnificent. Those of the Adal shahi dynasty at Bijapore and Gogi have attracted much attention, as also have those of the Bahmini dynasty at Gulburgah and the Kutub shahi dynasty at Golcondah. The cupolas at Roza where Aurungzeb is buried have not any display, and that of Aurungzeb is the least ostentatious. His daughter's tomb at Aurungabad is magnificent, and many of the tombs at Delhi and Agra are great structures. That of Mumtaz Begum known as the Taj Mahal is particularly remarkable. The reformers amongst the mahomedans consider that unbaked brick or earth should alone be used. The protestant christian doctrine that man, in all that he can do of good, is still without merit, is not shared in by mahomedans, buddhists or hindoos, who consider that a personal merit is gained by their good doing, and a mahomedan passing a funeral turns with it a short way and lends his shoulder to convey the body to the grave, thereby bringing a merit on himself. The thirteen tombs, the burial-places of thirteen emperors of the Mogul dynasty of China, are famed in China. —*Frere Antipodes, p.* 337.

TOMON MUNGA. Malay. Curcuma amada, *Roxb.*

TOMRA KUDU. Hind. Tomri. Hind. Cucurbita lagenaria, Lagenaria vulgaris.

TOM TOM. Hind. A drum.

TOMYRIS, the Getic queen of Scythia. Her opponent erected Cyropolis.

TONARENG, a nomade race dwelling in the great desert of Africa, very fair, with long hair, aquiline noses, high foreheads and thin lips. They say their prayers in Arabic, and speak a Semitic tongue. Their arms consist of a long lance with a broad head, javelins 6 or 7 feet long with jagged hooks at the pointed end, a round buckler ("darega") of buffalo or elephant hide from Soudan, a poniard and a broad bladed scymeter. See Semitic races.

TONCH, a river near Chandwara.

TONDAI-MANDALAM, an ancient name of a tract in Southern India extending from Nellore to the Coleroon river, and including North and South Arcot and the Chingleput collectorate. It is described as having been an ancient wilderness known as the Ramayanum Dandacaranyam, "the forest of the punisher," and was inhabited by the Kurambar, a pastoral and half savage race, who had their own chiefs residing in kotas or forts. They were conquered by an inroad of the Vellallar from the western portion of the peninsula in the reign of Adanda Chakravarti in an age supposed prior to the christan era. The Vellalar race found the clearance of the forest a task of such difficulty, that some withdrew; and the others who remained, had the peculiar privileges conferred on them by Adanda Chakravarti, which are called the Kani-atchi (acre-permanency). These have survived through the political changes of centuries, and are highly valued in a large portion of the old Tondai-mandalam.

TONDAMAN, an independent chief near Trichinopoly. See India. Maravar.

TONDA MARAM. Tam. Terminalia bellerica.

TONDEWOD, or Amadou.

TONDI. Tel. Terminalia bellerica, *Roxb.*

TONDI. Maleal. Callicarpa lanata.

TONGA, or Friendly Isles. The women saturate the hair with cococa-nut oil, and then powder it over with lime produced from shells. The Tonguese are a much lighter coloured race than the Fijians; in fact, they are real

Polynesians, whilst the Fijians are of Papuan origin. They are also a much handsomer and taller people. This physical superiority, which, independent of the difference of race, the Tonguese enjoy over the Fijians, may partly result from the different treatment to which the women are subjected amongst these two nations. Whilst in Tonga the women have been treated from time immemorial with all the consideration demanded by their weaker and more delicate constitution—not being allowed to perform any hard work—the women of Fiji are little better than beasts of burden, having to carry heavy loads, do actual field work, go out fishing —*Galton's Vacation Tourists, p.* 280. *D'Ewe's China.*

TONGARRON. See Kyans.

TONG-CHOW-FOO, in China, is about 13½ or 15 miles eastward of Peking.

TONGHOO and Martaban provinces comprise the provinces of Tonghoo, Amherst, Tavoy and Martaban. Revenue of Tenasserim in 1855-56, Rs. 833554, in 1856-57, 994526; of Martaban in 1856-6, 232442; 1856-7, 280704.

TONGKIN. See India.

TONGLO. A mountain in Tonking 27° 1′ 8″ N., L. 88° 3′ 9′ in Sikkim, the most southern prominent point of the Singhalila ridge. The top of the mountain is 10,080 ft., the grove at the foot of the peak, with a small pool surrounded by rhododendron trees, is 9,891. Barometrical observations taken simultaneously with those of Calcutta, give the height of Tonglo in southern Sikkim as 10,078·3 feet. Colonel Waugh's, by trigonometry, 10,070·4 feet—a remarkable and unusual coincidence.—*Hooker. Him. Jour. vol.* i. *p.* 171. *Herm. Schl.*

TONGO. See India.

TONGSCHI. CHIN. Pinus excelsa.

TONGUS. ENG. TAM. HIND. Catgut, also bres of Marsdenia tenacissima and of Caloropis gigantea.

TONGUS. To some of the tribes to which his term is applied, it would doubtless be telligible; whilst others, such as the Manchu, would, in all probability, repudiate it with indignation. The word, however, is useful, and it is used by the Russians, both in scientific works, and in ordinary language. The most western of the populations to which it applies are occupants of the Lower Tunguska; some of whom (perhaps all) call themselves Orotshong, and some of whom (perhaps all) are called by others Tshapodzhir; the men who bear this name tattoo themselves. For the Tongus at large there is not only no general name but nothing that approaches one. Different tribes designate themselves differently. Donki, which seems, word for word, Tongus, is one name: Beye, meaning the same, is another. The Manchu call all the tribes beyond the confines of Manchuria, and not the Tshapodzhir alone, Orotshong. Other names indicate geographical localities. Thus the Lamut are the men of the sea-coast. Meanwhile another division arises from their habits; these being determined from the domestic animal employed. All the members of the Tongus class belong to either Russia or China, those of China being the Manchu of Manchuria. The Manchurians, as a body, are perhaps somewhat ruder than the Mongols, and the Russian Tungus somewhat ruder than the Manchu. As a rule, they are shamanists, and imperfect converts to christianity, rather than buddhists.—*Latham's Nationalities of Europe, vol.* i. *p.* 267, 268.

TONI, or Indian canoe, is the hollowed out trunk of a tree,—near Bombay generally a mango tree. It must have been the first step in advance from that simplest form of naval architecture, the catamaran of Madras and Aden.—*Burton's Pilgrimage to Mecca,* vol. i. p. 277.

TONIN or Baglawang islands, near the south-east part of Celebes, are of moderate height and stretch a great way south of the island of Salaver.—*Horsb.*

TONJAGA. HIND. PUSHTU. Pavia Indica. Indian horse chestnut.

TONK. The nawabs of Tonk are descendants of the famous predatory leader Amir Khan, the companion in arms of Jeswunt Rao Holkar, who played a most conspicuous part in all the dissensions which preceded the British settlement of Malwa. Amir Khan was by connection, habit, and disposition essentially a Pindaree. On the entrance of the British into Malwa he made overtures to be admitted to protection, but the conditions he proposed were too extravagant to be acceded to. He was however offered a guarantee of all the lands held under grants from Holkar and the protection of the British Government, on condition of his abandoning the predatory system, dismissing his army, surrendering his artillery, with exception of forty guns, to the British at a valuation, and furnishing a body of troops to co-operate with the British force. To the terms offered him Amir Khan agreed, and they were embodied in a treaty in November 1817. To the territories thus guaranteed, the fort and district of Rampoora were added by the British Government as a free gift; and a loan of three lakhs of rupees, afterwards converted into a gift, was made to him. The district of Pulwul was also conferred on his son in jaghire for life. In lieu of the revenue of this district, which it was found inconvenient to make over to the management of the Nawab's son, a monthly stipend of Rupees 12,500 was assigned. Ameer Khan died in 1834, and was succeeded by his son Wuzeer Mahomed Khan, who did good service during the mutinies of 1857. His territories cover an area of 1,800 square miles, and contain a population of 182,000. The revenue is Rupees 800,000. The State pays no tribute to the British Government, nor are any local corps or contingents maintained from its resources. The regular military establishment consists only of about 500 or 600 horse. The Nawab receives a salute of seventeen guns ; he has received a sunnud guaranteeing the succession to his family according to mahomedan law in the event of the failure of natural heirs.—*Treaties, Engagements and Sunnuds, vol.* iv. *p.* 94.

TONKINESE. See Anam, India, Monsoon.

TONKIN BEAN of Dipterix odorata, a native of the woods of Guiana, is an oval, oblong, somewhat boat-shaped seed, one or two inches long, shining, with an oily surface marked with a network of wrinkles ; colour purple-brown, odour very fragrant, taste slightly bitter, but very burning and almost caustic. They are employed as a perfume for snuff.—*Faulkner.*

TONKING or Tung-quin gulf, is an extensive bight formed in the coast between the parallels of 17° and 22° N., and which is rendered a deep inlet by the peninsula of Lui-chew-fu and the island of Hainan which protect it, and in a great measure enclose it to the eastward. The entrance between Tigu Island and the south-west part of Hainan, is about 110 miles wide. The river of the same name falls into the north-west side of the gulf, by two branches called Rock-bo and Domea. In the entrance of this river there is but one flood and ebb in 24 hours, as occurs at the Island of Basselan, near Mindanao and the other islands in the Eastern Archipelago. See Tonkin.

TONS, from Sutlej to Jhilam, is the Picea Webbiana, also P. pindrow, the silver fir.

TONS, a tributary to the Ganges in lat. 24°, lon. 80° 30′ N. W., E. N. E., N., falls into the Ganges a few miles below Allahabad. Length, 165 miles. It receives the Satni, Behar, Mahana, Belun, and Seoti, including small streams, 13,000 square miles drained. It runs near Sahespoor in Dehra and near Ramnuggur, in Allahabad district. The Tons river is under the Garhwal and Dehra Dun authorities, the Pabar and the Giri run through Bashahir and Sirmur respectively : there is but little deodar in the upper valleys, and the streams are rapid, and the volume of water scanty.—*Powell's Hand-book,* vi. *p.* 529.

TONSE. A river of Jubbulpur.

TOOAR. DUK. MAHR. Cytisus cajan, *Linn.* Dhal. Dhol.

TOOBOOAN, or Keyser Island, lies mid-channel in Simank or Keyser Bay, on the south coast of Sumatra.

TOODOONG. JAV. a broad brimmed straw hat.

TOODOOVALLAY. Solanum trilobatum.

TOOIL KEERAY. TAM. Achyranthes polygonoides.

TOOKEE. TEL. Ebony.

TOOKPA. See Kunawar.

TOOLA-BARUM, in Travancore, a ceremony of the rajah distributing his weight of gold ; from tolah, HIND., a practice of weighing a person against his or her weight in silver or gold, and distributing the amount to the poor or to brahmans.

TOOLSEE. HIND. is the name given in India to species of Ocimum. In hindoo mythology Toolsee was a disciple of Vishnu. Desiring to be his wife, she excited the jealousy of Lukshmee, by whom she was transformed into the herb named after her. There are several well known species of the genus Ocimum, to each of which different names are given, viz., the Ram toolsee is the Ocimum gratissimum ; Babooye toolsee, Ocimum pilosum ; the Krishna toolsee, Ocimum sanctum ; but only the last and the common Toolsee, O. villosum, are held to be sacred to Vishnu and used in his worship. The toolsi plant is employed in the funeral ceremonies of the hindoos. See Ocimum.

TOOLSEE, a river near Kuckresir, 26 miles from Neemuch.

TOOLSEE BAI was born about A.D. 1790, in the house of Ajeebah, one of the Maun Bhow sect, at Mhysir. She was beautiful, and was married in the Deckan, but Jeswant Rao Holkar hearing of her, he placed her in his zenanah. She was quick and intelligent, and rode well. From that time she was the moving power in all the affairs of the durbar, but there were two factions, Mahrattas and Pathans, who alternately swayed the counsels. In 1811 Jeswunt Rao died, and she adopted Mulhar Rao Holkar, a child of four years of age, but her shameless profligacy with her dewan Gunput Rao had disgusted every one, and she had to seek protection in the fort of Gungram. In 1817, the British armies advanced towards central India, to whom she made overtures, but this displeased all her soldiers, the lad was removed from her care, a guard was put over her, and on the morning of the 21st December 1817, she was taken from her prison to the banks of the Seepre and there beheaded by a mahomedan jemadar when only 27 years old.

TOOLSOO-MOODRIYA. Beng. Leea macrophylla.

TOOM. Beng. Garuga pinnata, *Roxb.*

TOOMBA. Beng. Cucurbita lagenaria, *L.*

TOOMBI. Embryopteris glutinifera.

TOOMBIKA. Tel. Ebony.

TOOMBIKARA. Tel. Ebony.

TOOMBO. Beng. Hind. Cucurbita lagenaria.

TOOMBOODRA. A river of the Peninsula of India. See Mysore, Tumbudra.

TOOMBU or Toombee. Beng. Bottle Gourd, Cucurbita lagenaria.

TOOMI-CHAVA KARA. Tel. Ebony.

TOOMUTTIKAI. Bryonia callosa.

TOON. The timber of the Cedrela toona, a tree which extends over every part of India, and may be seen all along the foot of the Himalaya. The botanical specimens from Nepaul having frequently a sixth part added, Dr. Wallich was induced to call that variety Cedrela hexandra. There is, however, a distinct species, Cedrela serrata, which may be readily recognized by the great length of its racemes of flowers, and may frequently be seen with Sapindus acuminatus growing in the close valleys within the Himalaya. The toon resembles its congeners, chittagong wood and mahogany, and is very much used for furniture all over the peninsulas.—*Royle's Ill. Him. Bot. p.* 142. See Cedrela toona, Toon wood.

TOONA MARAM. Tam. Cedrela toona, *Roxb. Cor. W. & A.*

TOONDEE COIR. Tam. Calotropis gigantea, *Brown.* Rope or coir.

TOONG. Beng. Rottlera tinctoria.

TOONGBUDRA, properly Tumbudra, a tributary to the Kistnah river formed in lat. 14° N., lon. 75° 43′ E., by the junction of the Toonga and Budra rivers. It runs N. N. E., into the Kistnah, length 325 m. It receives the Chinna Hugry ; Hindry, 225 m ; and the Wurda. About 28,000 sq. m. drained. There are rocky obstacles to navigation in the upper part of its course. Fine teak forests on banks. See Tumbudra.

TOONIA JOOM MAHALS, a forest tract in the hills of the Chittagong district, which the Chukma race occupy along with Mug, Reang and Tipperah races, all more or less nomadic. Some one of these races, till lately performed human sacrifices annually, and in the year 1852, several persons were tried for murder by sacrificing. The place of sacrifice was a cleared district in the jungle and staked round with bamboos about six feet high. The sacrificial pole was a "Phula bans" bamboo, scraped and stripped at the edges, the hanging strips giving a rude notion of ornament. During the celebration of these sacrifices at Agartollah, a gun is fired every evening at sunset, when every person hurries to his home.

TOON-MARAM. Tam. Cedrela toona.

TOONTOONI-NUTI, Beng. Amarantus fasciatus.

TOON TREE. Eng. Cedrela toona, *Roxb.*

TOON-WOOD. Cedrela toona. The toon tree wood is of a reddish-brown colour, rather cross grained, but much used all over India for furniture and cabinet-work. Lieut. Nuthall, as quoted by Captain Munro, mentions "*toon*" as one of the woods of Arracan, under the name of "thit-ka-do," but Dr. Wallich says that thit-ka-do is a species of sterculia.—*Mason. Holtz.* See Toon.

TOOR, Hind. Cajanus Indicus, *Spreng.*

TOORANEE, or Turkish. The Soonee mahomedans are so called.

TOORASHAT. Sans. A name of Indra.

TOORBUT HYDEREE, is the hilly country between Meshid and Herat, both sides of the high road to within forty miles of that city, has been subject to Persia since 1833, and is held directly under Meshid. Previous to that period many petty chiefs, who were robbers, occupied the tract.—*Sir A. Burnes in P. P.*

TOORAY. Mollugo spergula.

TOOREE. A warlike tribe occupying a portion of the valley of the river Khurm ; they can muster 5,500 fighting-men. They are nominally subjects of Cabul, and belonged to the jagheer of sirdar Azim Khan, one of Dost Mahomed's sons ; but they are under no real control. They repeatedly leagued with other tribes to harass the Meeranzye valley. They would sow among the Meeranzye people, they would harbour fugitives from either party, they would encourage all to resist the British, they would attack some villages in force ; they frequently committed raids on the Bungush and Khuttuk villages of the Kohat district. In August 1853, Captain Coke seized a Tooree caravan on its way to the salt mines, taking the property as security for re-payment of value of plundered property, and the men as hostages for their tribes. This measure was soon followed by an embassy from the tribe and an agreement was concluded with the tribe from the commencement of 1854. The value of plundered property was made good, the prisoners were released, and five Tooree men were made over to the British as hostages ; but within one month, the tribe again gave way to evil counsels, and in March 1854, a serious attack was made by the Tooree, with 2,000 men (foot and horse) on a Meeranzye village. See Khyber.

TOOR-KA-DHAL. Hind. Cytisus cajan, *L.*

TOORKEE, the language which is in use

all over the north-west of Persia. It differs considerably from the Turkish of Constantinople, though both dialects were originally the same language. The Toorkee is in its ruder and simple form, whereas the Turkish has been much refined and mixed with other tongues.

TOORKHOORMATTEE is situated close to the gypsous hills of Kifri, and just west of the pass in them by which the Ak-soo penetrates into the plain.—*Rich's Residence in Koordistan, vol.* i. *p.* 27.

TOORRA, a bouquet.

TOORSHKUH, is north of Tubbus on the boundary of Herat. It is a district which is well watered and peopled, yielding good fruit. It is smaller than Kayn, and furnishes about 3,000 troops to the Shah, and has a governor appointed over it. It lies north from Meshid. —*Burnes.*

TOORSIE. A nuddy near Arvie in Dhoolia.

TOORTOOREE. HIND. A musical instrument, a trumpet.

TOORURATEE, female, Chatway (Chatua) male hawks, natives of Sind, with black eyes ; they are let loose after the season. See Hawking.

TOOS. A town 17 miles N.N.W. of Meshid, a little way from its entrance is the tomb of Ferdusi.

TOOSKEE. A lake in Ladakh about two miles long and half-a-mile in breadth, its waters are highly impregnated with soda. No fish are obtained in the lake, nor in the fresh water streams which run into it. A mountain-barometer makes the lake 15,000 feet above the sea-level. It is frequented by herds of mahoor or wild sheep, and several herds of kiang.—*Adams.*

TOOSTEE. SANS. from toosh, to please.

TOOT. BENG. Mulberry. Morus indica.

TOO-TA-BAT, BURM. On the annexation of Pegu, the king of Burmah lost the royal garden, which is a few miles out from the village of Twantay, in which the celebrated "Too-ta-bat" tree grows. In that locality there are some dozen or more of these trees, which furnished the royal table with the too-ta-bat fruit. The appearance of the tree is not unlike that of the common jack. It is said to be the Sapodilla plum which grows in abundance in the West Indies, and has a most luscious taste. The Burmese too-ta-bat, or sapodilla plum, is about the size of a large guava and resembles it in shape. When ripe, it has a green olive colour, and inside are four long bean-like seeds of a dark brown colour, which are surrounded by a mealy pulp. The taste of the pulp is not unlike a doorian, but it has none of the smell of that well known fruit. It leaves a little astringency and pungency on the tongue and palate. The flavour is that of a ripe mellow plum. This fruit is not seen in the market, because it is scarce, and what is picked off the trees is presented mostly as offering to the poongyees. The keeper of the Twantay garden, and all his children were formerly charged not to eat a single plum, on pain of immediate execution. All the fruit was picked and sent up to the capital, by express boats, for use in the palace. If a Burman only pointed his finger at a tree, he would be severely punished for it. To point a finger at one was to spoil fruit intended to be eaten only by the king and members of the Royal household.

TOOTEE, is the long silky hemp-like fibre of three species of Abutilon, the A. tomentosum, A. polyandrum and A. indicum.

TOOTH RELIC, the sacred tooth of Budha is in the Mallagawa or Temple of the Tooth in Ceylon. There is much ceremony when this tooth is exhibited, various orders for the opening of the chamber are requisite, before the bars may be taken down and the strong box unlocked. The tooth is enclosed in manifold caskets, one within another, becoming richer and more ornamented the nearer they are to the sacred relic. The last two or three are of very fine gold, set with rubies, diamonds and emeralds, but these like most oriental jewels, are roughly cut and ill set.—*Frere, Antipodes,* p. 185. See Inscriptions.

TOOTI, BENG. HIND. Cucumis momordica.

TOOTIYA-SABZ. PERS. Green copperas, or Green vitriol, Sulphate of copper.

TOOTA-KURA. TEL. Convolvulus reptans.

TOOTY, the roseate finch, Carpodacus erythrinus, is to be seen in flocks feeding on unripe mulberries.

TOOVARAY. CAN. TAM. Cytisus cajan.

TOP. HIND. PERS. Cannon, a gun.

TOPAIKA MARINDU. TAM. Gunpowder.

TOPAS, a name given to christians serving on ship board.

The topaz of the ancients was the greenish coloured substances now called peridot and chrysolite. The modern topaz is of a vinous orange colour, without any admixture of green, it is highly electric. It is a combination of alumina and silica with fluoric acid. Those used in jewellery come from Brazil, and an inferior kind from Saxony. The yellow oriental corundum and the large Bohemian yellow crystals are often sold as topaz. The pink topaz of jewellers is the Brazilian topaz modified by the action of fire. It emulates the Balas in tint and lustre. The colouring process is to envelope the stone, ready cut and polished, in German tinder, and fastened with wire, set it on fire, and when fairly burned out, the topaz will be found changed into a clear rose colour. But though the yellow topaz may be converted into pink by heat, it is a mistake to suppose that in the progress the yellow colour is changed into pink; the fact is, that one of the pencils being yellow and the other pink, the yellow is discharged by heat, thus leaving the pink unimpaired. Topaz is a fluo-silicate of alumina, a silicate of alumina with one-seventh of the oxygen replaced by fluorine. Rhombic; primary form a right rhombic prism. Cleavage perfect, at right angles to the principal axis. Colour, white, yellow, blue and green. Lustre vitreous, transparent to subtranslucent, streak white, fracture uneven, conchoidal, pyro-electric, cuts quartz, but is cut by ruby, H. 8 S. G. .3·4 to 3·6. Not acted on by muriatic acid. Digested for some time in sulphuric acid, yields hydro-fluoric acid. The topaz is divided by jewellers into two kinds, Oriental and Occidental. The first of these is, in fact, not topaz, but a hyalin corundum. Occidental topaz may be divided into three varieties, viz., yellow, blue, and white. With yellow topaz, the colour is generally a beautiful wine-yellow of different degrees of intensity, but at the same time very limpid. The stone is valued in proportion to the fulness of its colour, provided it loses no portion of its brightness. Yellow topaz occurs of large size compared with many other precious stones. Dumelle, a Parisian jeweller, in 1750, discovered one of the most remarkable properties of the Brazilian topaz, viz., that of changing from yellow to pink or pale crimson on exposure to a gentle heat and of retaining this colour permanently. He used to heat Brazilian topaz in a sand bath, but the process is much simplified now, the deeper the tint of the original colour, the deeper will be the rose colour, which sometimes becomes wine coloured like that of the Balas ruby, with which it is often confounded. Topaz is frequently found in rivers, generally with all the edges and angles of the original crystals worn off and presenting a rounded appearance, in which state it is often mistaken for the diamond, owing to the colour and specific gravity being the same. It may however easily be distinguished from the diamond by the hardness and fracture, the topaz being No. 9, and the diamond No. 10. Aquamarine and chrysolite are sometimes substituted for topaz, but may be easily distinguished by difference of hardness, specific gravity, and especially by not becoming electric by friction. Beautiful topazes of various kinds are found in the Burman dominions and in Ceylon, in which last mentioned country, a genuine greenish yellow coloured topaz is improperly called, Thunberg tells us, the yellow Tourmalin (Kaneke Turemale, *Sing.*) A light coloured smoky topaz is there as improperly called a yellow crystal (Kaha Palingu, *Sing*). and a dark coloured smoky topaz is mistaken for a brown crystal, and called Tillia Palingu by the Singalese. Oriental topazes are a variety of the genuine perfect corundum, and differ from the Occidental topaz, or that which comes from Saxony and Siberia, by the latter containing a greater proportion of silex. An inferior kind comes from Saxony. Topaz so called from the island of Topazion in the Red Sea. There is a gold coloured and greenish yellow topaz. The oriental topaz, according to its colour, receives the following names :—

Nova mina, colourless.
Brazilian sapphire, light blue.
Aquamarine, greenish.
Brazilian chrysolite, greenish yellow.
Brazilian ruby, pink or rose colour, artificially obtained.

Oriental topaz is found all over the world, in granite and gneiss rocks, which contain fluor spar. The oriental topaz is of very little value in commerce. The gem is of a yellow tint, seldom deep, of a light straw colour. Oriental topaz, ruby and sapphire, consist of pure alumina, coloured with oxide of iron.

TOPE, the term applied in Southern India to a grove of trees, generally of mango or tamarind.

TOPE. Sepulchral mounds occur at Sanchi, Bhilsa, near Benares, Tirhut, Behar, in Afghanistan, Tibet, Nepal and Western Asia, also in various parts of India, near the caves of Keneri or Kanuri; on the Neilgherry Hills, &c. On the demise of Sakya, the first Buddha, in B. C. January 543, his body was consumed, and his bones divided into eight portions, were distributed amongst applicants, who erected Stupas or Topes over them. Topes were in this way erected over his relics at (1.) Rajagriha, an ancient capital of Magadha or Behar Proper: (2.) Visali, at Bassalor, north of Patna: (3.) Kapilavastu, between Ayodhya and Gorukpoor: (4.) Allakappo:

(5.) At Ramagrama, in the neighbourhood of Gorukpoor and most probably (Sri-Rampura) the Selampura of Ptolemy : (6.) Wetthadipo, most probably Bettiya : (7.) Pawa was to the west of Visali, on the high road to Kusinara : (8.) Kusinara, equidistant between Benares and Visali, or in the position of Kusia on the little Gundak, and (9.) another tope was erected at Pipphaliwano, or the place of the Charcoal Tope, between Kapilavastu and Kusinara. The people of Visali are called Passalæ by Ptolemy. The numerous topes which still exist in India are chiefly confined to a few localities. The topes of Kabul and Jellalabad were opened by Messrs. Honigberger and Masson in 1835, and those between the Indus and the Jhelum by Generals Ventura and Court in 1833 and 1834. The topes near Benares were opened by Major Cunningham in 1835, and those at Sanchi and other places around Bhilsa, were also opened by him and Lieut. Maisey in January and February of 1857. The topes of Tirhut and Bahar still remain to be examined. Of the Bhilsa Topes none have yet been described excepting the largest of the Sanchi group near Bhilsa. An accurate plan and section of this building, with a short account of the various subjects represented in the sculptured bas-reliefs of the gateways, was published by Captain J. D. Cunningham, in the Journal of the Asiatic Society of Bengal. In the topes dedicated to the celestial Buddha, the invisible being who pervaded all space, no deposit was made, but the Divine Spirit, who is " Light," was supposed to occupy the interior, and was typified on the outside by a pair of eyes, placed on each of the four sides either of the base, or of the crown of the edifice. Such is the great Chaitya or Tope near Kathmandu, in Nepal, dedicated to Swayambhunath, the "Self-Existent," in which the eyes are placed on the upper portion of the building. A specimen of the regular Chaitya is represented in the 3rd compartment (inner face) of the left-hand pillar of the eastern gate at Sanchi, in which the two eyes are placed one above the other. Such also are the numerous Chhod-ten in Tibet which are dedicated to the celestial Buddha, in contradistinction to the Dungten, which are built in honor of the mortal Buddhas, and which ought to contain some portion of their relics either real or supposed. The first, Chhod-ten, means simply an " offering" to the Deity, the latter, Dung-ten, is emphatically a " bone," or relic-receptacle. The same distinction is preserved in the Sanskrit terms Chaitya and Dhatugarba or Dhagoba. The former is properly a religious edifice, dedicated to Adi-Buddha, while the latter is only a "relic-shrine," or repository of ashes. The word Chaitya, however, means any sacred object—as a tree, an altar, a temple—as well as any monument raised on the site of a funeral pile, as a mound or a pillar. Chaitya may, therefore, perhaps, be only a general term for both kinds of mound ; while Dhatugarbha or Dhagoba is particularly restricted to the " relic" shrine. The word tope is derived from Afghanistan, where it is used to designate all the solid mounds of masonry, some of which were opened by Messrs. Honigberger and Masson. The same term also is applied to the massive tower of Manikyala in the Punjab, as well as to all the smaller towers in its neighbourhood. There can be no doubt therefore that the term tope is the same as the Pali Sthupo, and the Sanskrit Stupa, a " mound" or " tumulus," both of which terms are of constant use in the buddhist books. Stupa, or Tope, is therefore a name common to each kind of tumulus ; whether it be the solid temple dedicated to the Supreme Being, or the massive mound erected over the relics of Sakya, or of one of his more eminent followers. From several passages in the Pali buddhistical annals, it would appear that topes were in existence prior to Sakya's advent; and that they were objects of much reverence to the people. Sakya himself especially inculcated the maintenance of these ancient Chaitya, and the continuance of the accustomed offerings and worship. In the sixth of his precepts, to the people of Vaisali, he enjoins them to maintain, respect, reverence, and make offerings to the Chaitya ; and to keep up the ancient offerings without diminution. But this was, doubtless, only a politic accommodation of his own doctrines to the existing belief of the people, adopted for the purpose of ensuring a more ready assent to his own views. Like as Mahomed recognised the prophetic missions of Moses and Elias, and the divinity of our Saviour Christ, so did Sakya Muni acknowledge the holy munis Karkutsanda, or Krakuchanda, Kanaka, and Kasyapa, as his immediate predecessors. They were probably heroes or saints, who obtained the respect of their fellow-countrymen during life, and their reverence after death. Stupas had been erected over their relics in the neighbourhood of Kapila and of Benares, and the worship was too firmly established to be attacked with any chance of success. Sakya therefore artfully engrafted them on his own system as the buddhas of a former age. It appears also that Stupas had been erected over supreme monarchs prior to Sakya's advent, for Sakya particularly informs his disciple Ananda that over the remains of a Chakravarti Raja, they build the Sthupo at a spot where four principal roads meet. It is clear, therefore, that the tope, or "tumulus," was the common form of tombs at that period. In fact, the tope, as its name implies, is nothing more than a regularly built cairn or pile of stones, which was undoubtedly the oldest form of funeral memento. The topes were, therefore, of three distinct kinds: 1st, the Dedicatory, which were consecrated to the Supreme Buddha: 2nd, the strictly Funeral, which contained the ashes of the dead: and 3rd, the Memorial, which were built upon celebrated spots. Of the Dedicatory Topes, as it is improbable that any deposit would have been placed in them, we may plausibly conclude that the largest topes, such as those of Sanchi, Satdhara, and Bhojpur, were consecrated to the Supreme Invisible Adi-Buddha. Of the Memorial Topes, little is at present known. It seems nearly certain, however, that the great Manikyala Tope was of this kind, for an inscription extracted from it, which begins with Gomangasa, "of the abandoned body," undoubtedly refers to Sakya's abandonment of his body to a hungry lion. This tope, therefore, dates earlier than the period of Fa Hian's Indian pilgrimage in A.D. 400. The Funeral Topes were of course the most numerous, as they were built of all sizes and kinds of material according to the rank of the deceased and the means of his fraternity. At Bhojpur, the topes occupy four distinct stages or platforms of the hill. The largest topes, six in number, occupy the uppermost stage, and were, he believes, dedicated to Buddha: that is, either to the celestial Buddha, Adinath, or to the relics of the mortal Buddha, Sakya. This view is borne out by the facts that the largest tope contained no deposit, and that the second and third sized topes yielded crystal boxes, one of which shaped like a tope, contained only a minute portion of human bone smaller than a pea.

There is a tope near Peshawar similar to those of Manikhyala and Belur. It is near a hundred feet high. They all have a chamber in the midst of the pile. It is not easy to trace the derivation of the word tope. Tumulus; modo terra tumens; alias sepulchrum. (Serv. ad Virg. Æn. II. 713.) But the dictionaries do not assign the latter sense to *tel* in Persian; nor to *tel* in Hebrew, although it may be implied. In the Turkish word *tepeh,* which the Persians pronounce *tappeh,* signifying a hillock or small tumular mountain, we may fancy a resemblance to the Greek *ταφος* (sepulchrum) or *ταφη* (sepultura), and it is applied (though not exactly in this sense) to some of the sepulchral heaps near Troy.—*Ouseley's Travels, vol.* ii. *p.* 112. *Cunningham's Bhilsa Topes.* See Cairns.

See Inscriptions, for the topes or tumuli of Kraku Chanda, Kanaka and Kasyapa. See Hindu for the topes of Manikhyala. See Kabul.

TOPE-KHANCHE. The border village on the grand trunk road. Chass was, on the old route viâ Hazareebung, the village where Bengal and Behar on each other gaze, and where the traveller has to pass on from one to the other province. Hence the popular saying of the Hindoostanees

Jab koi pâr hojátâ Châss
Tab chhorta nuhi ghăr kî âs.

TOPI. Guz. Hind. Tam. A hat.

TOPI-WALA. Hind. literally hat-fellow, —a derogatory term employed by natives of India to designate Europeans.

TOPOGRAPHIA CHRISTIANA. See Cosmas.

TOPPU NELLI. Tam. Phyllanthus emblica.

TOR or black Terin, a tribe occupying Pishin; Spin or White Terin, a tribe residing in the valley of Zawura, and in the open plains of Tull and Chutialli. They stretch into Cutch Gundava and nearly touch the British frontier.—*Latham.* See Afghan.

TOR. Hind. See Tawar

TOR. Hind. Euphorbia Royleana.

TOR, in Wellsted's time consisted of two villages, one of which is now completely fallen to decay. Hamilton describes Tor as a miserable hamlet, consisting of about twenty cabins, twelve of which are inhabited by christians of the Greek rite. The huts are constructed of madrepores, picked out of the sea; in one piece of wall eleven different species were counted. The sea there is also surprisingly rich in conchylia, the debris of which lie thickly strewn along the shore.—*Wellsted's Travels, vol.* ii. *p.* 9. *Hamilton's Sinai, Hedjaz and Soudan, p.* 13 *to* 14.

TORA. Such vocables as the Arabic Tur, the Persian Tora, and the Latin "Taurus" denote an ancient sisterhood of tongues.—*Burton's Pilgrimage to Meccah, vol.* iii. *p.* 32.

TORA. A number of trays, containing various dishes of food, presented to others by great men, or the dishes set before guests at meals.

TORA BUJJA. Hind. Adhatoda vasica.

TORAD GOPA? Euonymus tingens.

TORAMA. Amongst the Tartars, a dish of horseflesh boiled soft, and mixed up with turnips, carrots and dumplings.

TORA MALU. See Cybium guttatum.

TORA PANA. Hind. Baliospermum Indicum.

TORA POSH. A covering for dishes.

TORA-RANG-KONHA. Hind. of Bunnoo, black sand-stone.

TORA SHIGGA. Psht. Auriferous sand.

TORAYEN. See Koramber.

TORBANNA. Hind. Vitex negundo.

TORBEILA. See Khyber.

TORCH-THISTLE. Cercus senilis.

TORCH TREE. Torchwood. In India, Ixora parviflora, *Vahl.*; in Ceylon, a straight dried branch of the Pterospermum suberifolium is used for a torch. It is bruised into loose strips and it burns freely and steadily, one lasting for two hours.

TORDANDA. Hind. Euphorbia Royleana.

TORELAGA. Tel. Limonia acidissima, *Linn.* L. crenulata, *R.* ii. 381.

TORENIA. A genus of plants of the natural family Scrophulariaceæ, found in India the tropical parts of Australia, and in South America.

TORENIA ASIATICA. Linn.

Caela dola, Sans.

A plant found in almost every part of India, is described by Rheede as having the juice of its leaves employed as a cure for gonorrhæa on the coast of Malabar. It has a brilliant purple flower.—*O'Shaughnessy, page* 477. *Eng. Cyc.*

TORENIA CORDIFOLIA. Roxb.

Kaka pu, Maleal.

This annual spreading plant grows on the coasts of Southern India and is used in medicine.

TORGATS. See Halgas.

TORI. Hind. Sinapis dichotoma.

TORI. Hind. A vegetable.

Bhinda tori, Abelmoschus esculentus.
Galar tori, Trichosanthes anguina.
Ghia tori, Luffa pentandra.
Kali tori, Luffa acutangula.

TORIA. Hind. Sinapis dichotoma.

TORIKA. See Japan.

TORJAGA. Hind. Pavia Indica.

TORKI. Hind. Indigofera linifolia.

TORNADO. Span. Cyclone.

TORNGARSUK. The Greenlander believes that after death the soul travels to Torngarsuk, where reigns perpetual summer and sunshine and no night; where there is good water, endless seals, birds and reindeer.

TORPEDINIDÆ. The torpedo family of fishes, belonging to the order Plagiostomi, and the sub-order Raiinæ. Several genera and species occur in Indian waters, viz., Narcine Indica, Astrape dipterygia, Temera Hardwickii and Cysteocercus temeræ, but Dr. Cantor says, large individuals of Narcine are at Penang of rare occurrence, but younger, from 3 to 6 inches in length, are taken at all seasons, and in or out of water they may be handled with impunity. Several species of fishes introduced in a jar filled with sea-water and containing a large Narcine, shewed no consequences from the contact, nor did they appear to avoid the torpedo. The food of this and the other Malayan Torpedinidæ consists of *Crustacea* and *Testacea*. Torpedo, the principal genus, was founded by Dumeril upon the Raia torpedo of Linnæus, and some other species, distinguished by t and having the tail short and moderately guild- and the disc of the body nearly circ rdupois. anterior margin being formed by tw are only ed portions from the head, which, inc enever sideways, join the pectorals: the space the tween the head, the pectoral fins, and the branchiæ, is occupied by small vertical hexagonal tubes, which are filled with mucous matter, and largely provided with nerves from the eighth pair. The situation of these honeycomb-like cells, which constitute the electrical apparatus, is indicated on the upper surface by a slight convexity on each side of the head. Cuvier and Risso consider that several species have been confounded under a common name, and the latter of these authors has characterised four species of Torpedo in his 'Histoire Naturelle de l'Europe Meridionale.' They are

Torpedo Narke, which he describes as being yellowish-red above, and having five ocellated spots.

Torpedo unimaculata. This species has the body above fulvous, spotted with whitish spots, and one oblong ocellated spot in the middle of the back. The tail is more elongated and slender. It is said to have the electrical apparatus scarcely visible, and to give but very slight shocks.

Torpedo marmorata. Body flesh-coloured, and having brown spots and sinuous markings, producing a marbled appearance: tail thick above rounded.

Torpedo Galvani. Body fulvous, immaculate, but margined with black. Fleming refers the British Torpedo to the third of these species, Torpedo marmorata.—*Eng. Cyc. Cantor.*

TORRA VELAGA. Tel. A species of Feronia.

TORRENS, HENRY. Was Secretary to the Government of India from 1838 to 1845; Secretary to the Bengal Asiatic Society; Resident atMoorshedabad. He diedAugust 1852. He was a man of great learning, and almost universal accomplishments. Author of Translation of Arabian Nights, Calcutta, 1839— Wrote an Abstract of traffic across the N. W. frontier, in Bl. As. Trans. 1841, vol. x. 677, reprinted, Edin. Phil. Jl. 1841.—On Native impressions on the natural history of animals in Bl. As. Trans. 1849, vol. xviii. 778.—A memoir of him appeared in Corbyn's India

Review, 1842, vol. xii. 556; Bombay Times, June 6, 1851, and August 30, 1852.

TORRES ISLANDS. The great Torres islands are the most western islands of the Mergui Archipelago. They consist of two contiguous islands with some small islets near them, the centre of the western island being in lat. 11° 47′ N., long. 97° 28′ E. The ttle Torres Islands are a group of three or small straggling isles 9 miles south by Great Torres.

INGTON, VISCOUNT, in whose Go- nent of Ceylon, in 1848, a formidable ising of the Kandyans occurred.

TORS. By the natural weathering of rocks exposed to atmospheric vicissitudes, the perishable parts are removed, and the more resisting portions remain. In rocks which manifest peculiar arrangements of joints or natural divisions, the blocks and masses defined by their intersections often appear in cubical, sub-columnar, and other characteristic shapes. To masses more or less characteristic in figure, left by the decay of surrounding parts in prominent situations, the name of 'Tor' is applied in the granitic tracts of Devon and Cornwall. Tors are of very frequent occurrence in the granitic tracts of Southern India, where, as in Hyderabad in the Dekhan, and in the Ceded Districts, the piled up masses often are seen assuming the appearances of artificial structures.—*Eng. Cyc. Newbold.*

TORTOISES. In Southern Asia, there are about 32 species of land and freshwater tortoises, of the families Testudinidæ and Emydidæ. Testudo Greca inhabits a part of Syria, the Test. geometrica, an Afrcan species, is found also in the island of Ceylon; but the existence of the Test. Indica upon the coast of Coromandel is not confirmed. Of Trionyx, several species inhabit the rivers of Southern Asia. One has been observed in the Euphrates, which is perhaps identical with the Trionyx Nile, also found in Hindustan. The maintains the Tr. Gangeticus, peculiar, s is known, to that river; another, the nosus, which forms the passage to the is found also on the coast of Coro- while two others, Tr. stellatus and lanus, have been observed from Bengal to island of Java. The Trionyx of Japan longs most probably to the first of these, ich would thus be nearly as widely diffused he Emys vulgaris, of which a local variety ound in the islands of that empire. The other Emydes of the south-eastern portion of Asia are E. tectum, E. megacephala, so characteristic in its heavy or unwieldy form; E. Tetrionyx, intermediate between the Emydes and Trionyx, and a native of the river Irawaddy; E. Spengleri, of which several interesting varieties are known from the isle of France, Ceylon, Penang, Malacca, Sumatra, Java, Borneo, and China; and finally, two species, which vary from the others by their rounded shell, and of which one possesses a moveable sternum; E. couro inhabits China, the southern point of Celebes, and the islands of Penang, Java, and Amboyna; while the other, E. trijuga, has only been found in Java.—*Siebold, Faun. Jap. Chelonii per C. J. Temminck and H. Schlegel in Magazine of Zoology and Botany, V. I. pp.* 199, 200. *Gunther, Reptiles.*

TORTOISE BEETLES. See Coleoptera.

TORTOISE SHELL.

Ecaille de tortue.	FR.	Scaglia de Tartaruga,	IT.
Schilpad,	GER.	Sisk; Kurakura,	MALAY.
Kachakra,	GUZ. HIND.	Sisik panu,	,,
		Kulit-panu,	,,

The scales of the turtle are extensively used in the manufacture of combs, snuff-boxes, in inlaying, &c. The goodness of tortoise shell depends mainly on the thickness and size of the scales, and partly on the clearness and brilliancy of the colours. The tortoise shell of the Indian Archipelago is considered superior to that obtained from Singapore, the African Coast, the West Indies, and the Laccadive and Maldive Islands. In Ceylon the marginal pieces of tortoise shell are used at Point de Galle in the manufacture of bracelets and necklaces formed of a chain of shell, it resembles amber in appearance; these bear a higher price than such as are formed by the darker shell. In Ceylon there is a great demand for tortoise-shell for the manufacture of combs, which are worn by men as well as women among the Singalese. In the numerous excesses into which English costume has been carried, the size of the back comb worn by ladies has never attained that of the Singalese men, who also wear a narrow long bent comb across the fore part of the head—the lighter coloured shell is most esteemed by them. Five pounds is a moderate price for a tortoise shell back comb, which increases in value according to the size and quality of the shell: hair pins of tortoise-shell are worn by the women, gold and silver being substituted for full dress; these hair pins are among the articles purchased by passengers in the steam-boats. The Malay tortoise-shell term "*Sisik-panu*," is literally "tortoise scales." The only part of the sea tortoises or turtles held of much value by the natives of the Indian islands is the shell. Tortoises are found in all the [illegible] of the Malay and Philippine archipelagos, but the imbricated kind that yields the finest shell is most abundant in those of Celebes and the Spice Islands, as far as the coast of New Guinea. The parties chiefly engaged in their capture are the Bajurace, nomadic hunters of the Archipelago, of whom the turtle is the principal game. These people distinguish four species of sea-turtles, to which they give the names of kulitan, akung, ratu, and boko. The last is the panu of the Malays, and the green esculent turtle, of which the carapace is of no use, the animal being valued only for its flesh to sell to the Chinese and Europeans, for among the mahomedans it is unlawful food. The three first named species all yield a marketable shell. The ratu, which signifies king or royal turtle, is said to be of great size, measuring from five to six feet in length, but is not often taken, and the shell is of inferior value. All the finest shell is afforded by the first, the kulitan, the name, in fact, signifying "shell turtle." Amongst the more valuable of the commodities which the enterprizing and industrious Bugi annually bring from Celebes and other eastern islands, tortoise shell holds one of the first places. The quantity imported into Singapore sometimes rises above 13,000 and sometimes sinks below 7,000 pounds, but the average one year with another is about 10,000 pounds. Mr. Vosmaer describing its collection by the Orang Baju of the south eastern peninsula of Celebes, also mentions that they distinguish four principal kinds of tortoise, and name them kulitan, akung, boko, and ratu. The first named is the kind, which on account of its costly shell, is the most prized ; it is from the so named Karet tortoise. The shell or back of this creature is covered with 13 shields or blades, which lie regularly on each other in the manner of scales, five on the middle of the back and four on the sides ; these are the plates which furnish the costly tortoise-shell to art. The edge of the scale or of the back is further covered with 25 thin pieces joined to each other, which in commerce are known under the appellation of feet or noses of the tortoise. The value of the tortoise shell depends on the weight and quality of each head, under which expression is understood the collective tortoise-shell belonging to one and the same animal. Tortoise-shells which have white and black spots that touch each other, and are as much as possible similar on both sides of the blade, are, in the eyes of the Chinese, much finer, and are on that account more greedily monopolized by them, than those which want this peculiarity, and are on the contrary reddish, more damasked than spotted, possess little white, or whose colours, according to their taste, are badly distributed. The caprice of the Chinese makes them sometimes value single heads at unheard of prices, namely, such as pass under the name of white heads, which they also distinguish by peculiar names. It is almost impossible to give an accurate description of these kinds, and of their subdivisions ; for these depend on many circumstances which remain inappreciable to our eyes. It is therefore enough to remark on this subject that such heads as, possessing the above named qualities, are very white on the blades and have the outer rim of each blade to the breadth of 2 or 3 fingers wholly white, and the weight of which amounts to 2½ catties (qualities which are seldom found united), may be valued at one thousand guilders and upwards = £24 per lb. avoirdupois. The feet or noses of the tortoise shell are only destined for the Chinese market ; whenever the two hinder pieces are sound and have the weight of ½ catty or thereabouts, which is very seldom the case, they may reach the value of fifty guilders and more. The whole shell of a tortoise seldom weighs more than 3 catties, notwithstanding it is asserted that there sometimes occur heads of 4 and 5 catties. Tortoise shells are also sometimes found, of which the shell, instead of 13 blades, consists of a single undivided blade ; the Orang Baju call this kind, which very seldom occurs, Lojong, or Loyong.

The Akung also furnishes tortoise shell (karet), but the shell being thin, and of a poor quality, much less value is attached to it.

The Boko is the same as that which is called Panju by the Malays. It is the common sea tortoise, which is of no other use than to be eaten. To these sorts the Panjubui ought to be added, being the common tortoise, with a thick shell, like that of the proper tortoise, but of poor quality and therefore of trifling value ; so also the Akung-Boko, which is distinguished from the common boko by its much larger head.

The Ratu, lastly, furnishes a sort which is distinguished by its peculiarly great size, the Orang Baju asserting that it is usually twice as big as the largest tortoise-shell tortoise, and therefore 5 to 6 feet long and even more.

The usual modes by which the Orang Baju catch the tortoise are principally by the hadung, the harpoon, and the net ; or by falling upon the females when they resort to the strand to lay their eggs, which is the most usual, almost the only way by which the inhabitants of the coast catch this animal. So soon as they have got the creature in their power, they turn it on its back, when, unable to recover itself, it remains lying helpless. It sometimes also falls into the fishing stakes, into which it enters like the fish.

Whenever the Orang Baju have caught a tortoise, they kill it immediately by blows upon the head. They then take its upper shield or the back itself quite off, being the only thing about the animal which has value. The tortoise shell adhering so fast to the shield that, if they at once pulled it off, there would be danger of tearing the shells, they usually wait three days, during which time the soft parts become decomposed and the shells are loosened with little trouble. When they wish to remove the shell immediately after the capture, they separate it by means of boiling water. They also often accomplish this object by the heat of a fire, in the application of which, however, a danger is run of injuring the shell by burning it, for which reason this mode is only adopted by those who do not know its value. The Indian islands furnish the largest supply of tortoise-shell for the European and Chinese markets, the chief emporia being Singapore, Manilla and Batavia, from which are exported yearly about 26,000 pounds; and one half of this quantity is from Singapore. Mr. Morrison tells us that the best tortoise-shell comes to China from the Spice Islands and New Guinea, but it is collected all over the Archipelago and West Pacific. The common name of the Testudo imbricata is hawk's bil tortoise. The shell is thicker, clearer, and more variegated than that of any other species and constitutes the sole value of the animal It is heart-form, and consists of thirteen inner with twenty-five marginal divisions The middle side-pieces are the thickest, larges and most valuable; the best is in larg plates, free from cracks or carbuncles, an almost transparent. The small broken an crooked pieces are worthless. The Chinese us large quantities in the manufacture of combs boxes, toys, &c. During the H.E.I. Co.'s monopoly, tortoise-shell was brought to the Chines market for exportation to England, but it i since carried to Singapore, and very little i brought to Hong-kong. The price varie from 1000 dollars down to 200 per pecu according to quality.

The export of tortoise-shell from Madras i 1854 was lbs. 308, value Rs. 2,204. At th Madras Exhibition, the epidermoid plate which overlap the back shell of the marin turtles, transmitted from Travancore, wer apparently fine plates. Another epiderma production, called tortoise shell, from Madur and other inland localities, was exhibited but the specimens were of little value. McGillivray says of the Caretta imbricata, producing the greater part of the tortoise shell of commerce, and which is not rare in Torres Strait, that it is distinguished by having the posterior angle of each dorsal plate projecting, so as to give a serrated appearance to the margin of the carapace which, in the present species, is quite smooth. The green turtle average 350 lbs. each, and the hawk's-bills about 250 lbs. Although a strong prejudice existed against the hawk's-bill as an article of food, it is at least equal to the ther. He saw newly hatched turtle running bout in every direction, and among their umerous enemies, was a burrowing crab Ocypoda curs[illegible]) which runs with great swiftness along the sandy beaches. Tortoise-shell, o the extent of 7000 to 13,000 pounds, is rought from the Celebes and other eastern slands to Singapore.—*McGillivray Voyage, Vol. I. p.* 51. *M. E. J. R. Morrison Compendious Description. Crawfurd Dict.* page *No.* 439. *Journ. of the Ind. Archipel. vol.* iii. *V. June* 1849. *Faulkner. Rohde MSS.*

TORTOSA, called by the natives Tartous, he ancient Orthosia. It is situated on the seashore, having a spacious plain extending round about it on its other sides.—*Robinson's Travels, vol.* II. *p.* 70.

TORTRICIDÆ. This family includes ylindroplus maculatus, *Linn.* and C. rufus of Ceylon.

TORTUES FRANCHES. See Chelonia.

TORTURE. Many methods of torture are still practised in India, more particularly the various modes of compressing and binding the limbs and chest, and burning and branding. The latter practice still lingers throughout the Bengal Presidency, and prints of the chillum and hata are by no means rare. —*Calcutta Review January* 1871.

TORUN. In Rajputana, this symbol of marriage consists of three wooden bars, forming an equilateral triangle, mystic in shape and number, and having the apex crowned with the effigies of the peacock; it is placed over the portal of the bride's abode. At Oodipoor, when the princes of Jessulmir, Bikaner and Kishengurh simultaneously married the two daughters and the grand-daughter of the Rana, the toruns were suspended from the battlements of the tripolia, or three arched portal leading to the palace. The bridegroom on horse-back, lance in hand, proceeds to break the torun, torun-torna, which is defended by the damsels of the bride, who from the parapet assail him with missiles of various kinds, especially with a crimson powder made from the flowers of the palasa, at the same time singing songs fitted to the occasion replete with double entendres. At length the torun is broken amidst the shouts of the retainers, when the fair defenders retire. The similitude of these ceremonies to others in the north of Europe and in Asia, increases the list of com-affinities, and indicates the violence of rude times to obtain the object of affection; and the lance, with which the Rajpoot chieftain breaks the torun, has the same emblematic import as the spear which, at the marriage of the nobles in Sweden, was a necessary implement in the furniture of the marriage chamber. We discover in this emblem the origin of the triumphal arches of antiquity, with many other rites which may be traced to the Indo-Scythic races of Asia. The torun, in its original form, consisted of two columns and an architrave, constituting the number three, sacred to Hari the god of war. In the progress of the arts, the architrave gave way to the hindu arch, which consisted of two or more ribs without the keystone, the apex being the perpendicular junction of the archivaults ; nor is the arc of the torun semicircular, or any segment of a circle, but with that graceful curvature which stamps with originality one of the arches of the Normans, who may have brought it from their ancient seats on the Oxus, whence it may also have been carried within the Indus. The cromlech, or trilithic altar, in the centre of all those monuments, called druidic, is most probably a torun sacred to the sun-god Belenus, like Hur or Bal Siva, the god of battle, to whom, as soon as a temple is raised, the torun is erected, and many of these are exquisitely beautiful.—*Northern Antiquities. Tod's Rajasthan, vol.* I. *p.* 271.

TORYA. Hind. A variety of mustard seed.

TOS. Hind. Abies Smithiana, the Himalayan spruce, also Abies or Picea Webbiana.

TOSA, of Nepaul, Hordeum hexastichon, *Linn.*

TOSALI. See Inscriptions.

TOSHA. A vow or oblation.

TOSHA-KHANA. Hind. The wardrobe of royalty.

TO-SHAK. Hind. A mattrass.

TOSI MAIDAN. See Kashmir.

TOTA. Tel. Totam. Tam. A garden.

TOTA BALI RAKASA. Tel. Colocasia Indica, *Voigt.* Arum Indicum, *Roxb.*

TOTA DULA GONDA. Tel. Mucuna utilis, *Wall.*

TOTA KURA, or Perugu tota kura, Tel. Amarantus oleraceus, A. tristis, and other cultivated kinds.

TOTAL VADI. Tam. Mimosa pudica.

TOTANUS CALIDRIS. Common Redshank of Europe, Asia; very common in India.

Totanus fuscus. Spotted Red-shank of Europe, Asia ; common in India.

Totanus glottis. Green-shank of Europe Asia, Africa, Australia ; stragglers obtained in N. America, very common in India.

TOTA VEMU. Tel., also Chiku velaga. Decliptera parvibracteata, *Nees.*

TOTEM. An early stage in religious progress, is that which may be called totemism. The savage does not abandon his belief in fetichism, from which indeed no race of men has yet entirely freed itself, but he superinduces on it a belief in beings of a higher and less material nature. In this stage everything may be worshipped—trees, stones, rivers, mountains, the heavenly bodies, plants, and animals. A family, for instance, which was called after the bear, would come to look on that animal first with interest, then with respect, and at length with a sort of awe. The habit of calling children after some animal or plant is very common. In China also the name is frequently that of a flower, animal, or such like thing. In India, amongst the slave girls of the mahomedan harems, the nargas, the sosan, the narcissus, the lily, &c., are in common use as names. In Australia we seem to find the totem, or, as it is there called, kobong, almost in the very moment of deification. Each family, says Sir G. Grey, adopts some animal or vegetable as their crest or sign, or kobong as they call it ; but it is more likely that these have been named after the families, than that the families have been named after them. A certain mysterious connection exists between the family and its kobong, so that a member of the family will never kill an animal of the species to which his kobong belongs, should he find it asleep ; indeed, he always kills it reluctantly, and never without affording it a chance of escape. This arises from the family belief that some one individual of the species is their nearest friend, to kill whom would be a great crime, and to be carefully avoided. Similarly, a native of Australia who has a vegetable for his kobong, may not gather it under certain circumstances, and at a particular period of the year. Here we see a certain feeling for the kobong or totem, though it does not amount to worship. In America, on the other hand, it has developed into a veritable religion. So also among the Khonds of India, the different tribes take their designation from various animals, as the bear tribe, owl tribe, deer tribe, &c. The Kol of Nagpore also are divided into 'keeli' or clans, generally called after animals, which, in consequence, they do not eat. Thus the eel, hawk, and heron tribes abstain respectively from the flesh of these animals.—*Lubbock Origin Civil,* 173.

TOTILLA-GASS. Singh. Calosanthes Indica, *Blume.*

TOTTE. See Tibet.

TOTTENHAM. See Lightning conductors.

TOTTI, of the Tamul people, is a village servant who waits upon the villagers. The domestic Totti does the humblest part of the house work.

TOTTYAR, a race of Coimbatore, who settled there from the north.

TOU. In the midst of a Tartar camp is a standard formed of a long pike, to which are attached seven white yak's tails, one above another. These standards are called tou by the Chinese; and, doubtless, it is from them that the name of the Turkish standard, the "toug" has been derived. "It is," says Cuvier, "with the tail of the yak, a kind of small buffalo with a long-haired tail, like that of the horse, itself a native of the mountains of Tibet, that those standards were first made which are still in use among the Turks."—*Regne Animal, vol.* I. *p.* 270. *Huc's Christianity, vol.* I. *p.* 121.

TOUBA TREE, of the mahomedans, a fabulous tree which is mentioned in the Koran.

TOUCAMBASO. See Token besseys.

TOUK-KY-AU. Burm. Pentaptera arjuna.

TOUK-YAT —— ? See Dyes.

TOUK-TA. Burm. Taccapinnatifida, *Linn.*

TOULA. See Kouren.

TOULOUP, a winter-dress of the peasants.

TOUNBEIN. Burm. Artocarpus mollis, *Wall.*

TOUNG. Burm. A hill; wild, uncultivated.

TOUNG-BEN. Burm. Artocarpus echinata, *Roxb.* The timber is equally lasting with Thengan, but scarcer than the latter and of size to afford a large canoe. In Amherst, it is used in boat-building and for making carts. It is a strong, heavy wood, well adapted for handles of tools, &c.—*Cat. Ex.* 1851.

TOUNG-BHAUT. Burm. In Tavoy, a rough, knotty wood, used for knife and spear-handles.—*Mr. Blundell.*

TOUNG BHIEN. Burm. A light porous wood of Tavoy, used for common carpentry.—*Mr. Blundell.*

TOUNG-BYE-NAY. In Tenasserim, a brittle short-grained wood. Not the mountain jack, though similar to it in name; maximum girth 5 cubits, maximum length, 30 feet. Scarce, but found along the banks of rivers all over the provinces. When seasoned it floats in water.—*Captain Dance.*

TOUNG-BYENG. Burm. In Tavoy a kind of red saul.—*Mr. Blundell.*

TOUNG-BYIOU. Burm. A close grained, brown shaky wood of Tavoy.

TOUNG-DA-LAI. Burm. Garcinia *sp.*, G cowa, G. Roxburghii, *McClelland.*

TOUNG-GA-LA. Martaban. Ancistrolobus carneus, *Wall.*

TOUNGHOO. A town and military cantonment on the Salwin river in British Burmah: See Pegu, Karen.

TOUNG-KHA-RAY. Burm. A wood of Tavoy, where it is called Red Jarool; used in boat-building.—*Mr. Blundell.*

TOUNG-KA-THEEL. Burm. Erythrina Indica, *Lam.*

TOUNG-MA-YOA. Burm. A tree of Moulmein, wood smooth, and used by the Burmese as a slate or writing board.—*Cal. Cat. Ex.* 1862.

TOUNG-PEING-NAI. Burm. Artocarpus echinata, *Roxb.*

TOUNG-THA-KHWA. Burm. In Amherst, this is a capital wood for any purpose; used for gun-carriages or gun-stocks.—*Cat. Ex.* 1851.

TOUNG-THA-BYIOU. Burm. In Amherst, a kind of Acacia used for house posts; it is a strong, red, heavy wood.—*Cat. Ex.* 1851.

TOUNG-THA-LAY. Burm. Garcinia, *sp.* G. cowa; G. Roxburghii, *R. W.*

TOUNG-THAU-GYEE. Burm. In Amherst, a hard compact wood of a dark brown colour.—*Cat. Ex.* 1851.

TOUNG-THU. A tribe, occupying the valley of Salwyn, from lat. 18° to lat. 20° N. The Toungthu dwell between the Setang and the Salwin and in Amherst Province, and are in their dialect more closely connected with the Yuma languages than with the Burman. The Toungthu has a large glossarial agreement with Karen, but it has special affinities with the Kumi and other Yumi dialects, and particularly with the Khy-eng. The Toungthu are islamized Chinese and are said to resemble the Anamese, but as their dress resembles that of the Anamese, this may create deception. Those who occupy a portion of province Amherst, are the only people there who understand the plough. This has a metal blade. They are esteemed good cultivators.

TOUNG-ZA-LAT. Wrightia species.

TOUN-KA-TSEET. Burm. A tree, one of the Leguminosæ, not uncommon on the hills of British Burmah, wood used for canoes. A cubic foot weighs lbs. 45 : in a full grown tree on good soil, the average length of the trunk to the first branch is 50 feet, and the average girth, measured at 6 feet from the ground, is 10 feet.—*Dr. Brandis, Cal. Cat. Ex.* 1862.

TOUN-NEIN-NAI. Burm. Artocarpus, species.

TOUPAT KURUNDU. Singh. Cinnamon.

TOUR.

Cajanus Indicus.		Cytisus cajan.	
Togari,	Can.	Toordhal,	Hind.
Pigeon Pea.	Eng.	Thovary Purpoo,	Tam.
Large Dhal,	,,	Kandi papu,	Tel.

This is sown in fields at the commencement of the rains in June, and sometimes much later; it is ripe in December. The seeds are sometimes ground into flour, or split like dry peas: for the latter, they are an excellent substitute. There are several varieties, which sell from 30 to 40 seers for the rupee. Is partly sown along with ragi like bullur, and partly in full in dry lands. The quantity of it grown in Mysore is not sufficient for the wants of the people, and it is consequently largely imported into that district from Baramahal and Bellary.

TOURGOUTH. See Kalkas.

TOURMALINE is a corruption of the Ceylon name. The colours of tourmaline are generally dull, and so dark as to appear nearly black. It varies, too, very much in transparency. On account of its property of polarising light, it is used largely in the manufacture of polarising instruments.

Lyncurium is supposed to be the ancient name for common tourmaline; and the red variety was probably called *Hyacinth.*

Yellow tourmaline.—Among the Ceylon diamonds which are seen for sale in Moulmein, is a yellow tourmaline resembling topaz. The yellow tourmaline from Ceylon is but little inferior to the real topaz, and is often sold for that gem.

White tourmaline.—An occasional crystal of white tourmaline is seen among the crystals of the black variety in specimens from the Shan states. White jewels of an inferior quality are often offered for sale in Moulmein under the name of Ceylon diamonds, but they are usually made from green tourmaline. White tourmaline is a rare mineral, but the green variety being common, the jewellers by exposing it to heat, expel its color, and it becomes white.

Red Tourmaline, or *Rubellite,* occurs in Ceylon, Burmah and Siberia, also constitutes a fine stone, and of great value when it is free from cracks and flaws. The finest known specimen of this gem, now in the collection of minerals in the British Museum, Room III, case 40, is of uncommon form and dimensions, and was presented to Colonel Symes by the King of Ava, when on an embassy to that country. They have all the richness of colour and lustre belonging to the ruby, though measuring an inch across. A Siberian specimen of this variety, also in the British Museum, is valued at 500*l.* The yellowish grey and hyacinth brown varieties are chiefly brought from Ceylon, and the smoky green and blue from Brazil, on which account they are often called Brazilian emeralds and sapphires.

Schorl, or black tourmaline, is found in Madura in great abundance, also in quartz near the mouth of Tavoy river on the east side, and also at the foot of the eastern mountains near the head waters of the Dabgyaine, north-east of Moulmein. In both places the crystals are numerous, and in Tavoy they are large, but not so handsome as seen in foreign specimens.

Green tourmaline, when clear and fine, is valuable for gems, and specimens which cannot be distinguished by the eye from beryl, are brought with the Ceylon diamonds; green tourmaline may be ascertained by a very simple test, for beryl scratches quartz, but tourmaline is scratched by quartz.—*Mason. Dana, Manual of Mineralogy. Bristow Mineralogy, p.* 386.

TOURMET. Chakar is a country bounded on the east by Jeshekten, on the west by Tourmet, and by the Sooniot district on the north. In this Chakar district is the city of Tolo-Noor (seven lakes) called by the Chinese "Lama Mias," by the Mongols "Nadan Omo," by the Tibetans "Sat Doon." On the French map the place bears the name of "Naiman Soome."—*Prinsep's Tibet, Tartary and Mongolia, p.* 39.

TOURNEFORTIA, a genus of plants belonging to the natural order Boraginaceæ. The species forming small shrubs or herbs, are about 50 in number, diffused through the West Indies, S. America, Indian islands, and India. —*Voigt.*

TOURNESOL. Fr. Litmus.

TOU TCHOW. Dioscorea batatas.

TOUW WERK. Dut. Cordage.

TOVARAY. Tam. Cajanus Indicus, *Spreng.*

TOVARI MANNU CHETTU. Tel. Tovari is Cajanus, but the word mannu signifies the earth, and the Sanscrit name Tuvarika is said to be fragrant earth.

TOWA. A river near Hoshungabad.

TWALLAM. See Tin.

TOWELS of different sizes are made in the districts of Cuddalore, Chingleput, and in the outskirts of Madras, of a quality equal to those of English manufacture.

TOWER of Manikyala. See Buddha.

TOWQ. A collar or ring, worn round the neck.

TOWNI. Tam. Taniki mara, Malayalum. This Malabar and Canara tree grows to about three and a half feet in diameter, and from thirty to forty-five feet long; it is of a whitish colour, and is used by the natives for catamarans, canoes, &c. It produces a fruit used as a purgative in cases of fever,&c.; the timber is not durable or of much use.—*Edye, Forests of Malabar and Canara.*

TOWN-PI-NE, Burm. In Tavoy, a good wood, used in boat building.—*Dr. Wallich.*

TOWRU. Tam. Tel. Toguru, bran.

TOWTAL. The Malayala name of a tree which grows to about two feet in diameter and thirty feet high. It is remarkably light but not very durable, and is used by the natives for catamarans, &c.—*Edye. M. and C.*

TOXOTES JACULATOR. Pallas. appears to be the fish described by MM. Cuvier and Valenciennes from a drawing in the series, formerly in the late Colonel Farquhar's possession. The food of several examined, consisted of remains of crustacea. In the Straits of Malacca this fish occurs, but not numerously, at all seasons. It is eaten by the Malays, who record its habits in the denomination, ikan, signifying a fish, sumpitan a blow-pipe.

TOY CART. A Sanscrit play, the Mrichikata, by Kalidasa, translated by Professor Wilson.

TRADESMEN. The tradesmen and artizans of India are mostly all associated in classes, or sects, or castes, who do not intermarry and seldom eat with others. Amongst these may be named the Banjara or wandering grain-merchant; the Bhatthari or cook; Chichri or scavenger; the Dhor or currier and leather worker; Dhangar or shepherd; Erkal-vadu or basket maker; Goali or dairyman; Kalaigar or tinner; Kassar or brazier; Khanjar or poultryman; Ladaf or cotton seller; Lar-kassai or beef salesman; Lal begi or scavenger; Lohar or blacksmith; Mookre or mealman; Muchi or leather worker; Rangrez or dyer; Saikalgar or cutler; and Sonar or gold-smith. There are many wandering tradesmen tribes, mostly predatory. The black-smith, goldsmith, brazier, carpenter, and stone cutter are styled the five artizan castes, komsala, or kansala, in contradistinction to the five learned castes. The artizan castes all wear the poitu or sacrificial cord; they do not revere brahmins, and they carry their dead to the grave, and inter them in a sitting posture. The names for the various trades vary in the several languages of the East Indies, but throughout British India, the family or caste separation of trades prevails. In further India and the Eastern Archipelago, where the system of caste does not prevail, some avocations as the butcher, the leather worker, the burier of the dead, are deemed unclean.

TRADESCANTIA, a genus of plants belonging to the Commelynaceæ, or Spider-wort tribe, natives of America and India; twelve species occur in the East Indies. T. axillaris is used in India as an external application in tympanitis.—*Voigt.*

TRADE-WINDS are winds which blow continuously from one direction, and are so called because of the facilities which they afford to trade by sea. They differ from monsoons, which blow one-half of the year from one direction, and the other half from an opposite or nearly opposite direction. There are two trade-winds, the north-east on the north of the equator, and the south-east to the south; and like all winds, these are put in motion by the heat of the sun, and directed by the daily rotation of the earth. The belt or zone of the S. E. trades is broader than that of the N. E. trades; its current even crosses the equator, and invades the belt of the N. E. trades, and discharges itself into the region of equatorial calms. Ships sailing on the ocean, calculate on meeting the tradewinds and monsoons in certain parallels of latitude, and sail for weeks with their ropes and sails unaltered. When the N. E. and S. E. trades meet, the equatorial calms are produced, in which constant rain prevails; it is the condensed vapor of the ocean. Trade-winds, in the Pacific Ocean, blow from the N. E. between 9° and 27′ N. lat., and from the S. E. between 3° and 25′ S. lat. But there is on the polar side of the north-east trade-winds an immense area of arid plains for the heat of the solar ray to beat down upon, also an area of immense precipitation. These two sources of heat hold back the north-east trade winds, as it were, and when the two are united, as they are in India, they are sufficient not only to hold back the north-east trade-wind, but to reverse it, causing the south-west monsoon to blow for half the year instead of the north-east trade.—*Maury's Physical Geography, p. 103.* See Cyclone, Hurricane, Monsoon.

TRAFALGAR. A word of Arabic derivation, from Tarf el Gharb, the side or skirt of the West, it being the most occidental point then reached by Arab conquest.—*Burton's Pilgrimage to Meccah, Vol. I., p. 9.*

TRAGA. Hind. A self-immolation practised by bards and charans, the self-shedding of blood by a bard to enforce his demands. There prevailed in India a practice of hiring a person of a religious class, generally of the bard or bhat tribe, to threaten to injure himself unless redress were given. The person so hired threatened to kill or wound himself, or some other person, unless the demand he made were complied with. It has been put down by law.

,, Dragon,	,,	Vadomocottaypisini,	TAM
Gommi astraganti,	FR.	Badam vittu bauka,	TEL.
Traganth,	GER.		

The gum tragacanth of commerce is a product of several plants. Tournefort adduced as it source, *A. creticus* of Lamarck, a native of Mount Ida in Crete. Labillardiere describes *A. gummifer*, a native of Mount Libanos in Syria. Olivier names *A. verus*, inhabiting Asia Minor, Armenia, and northern Persia. In Crete and surrounding islands, this gum is gathered about the end of June from the Astragalus tragacantha. Arab authors describe it by the name kasira or katira, for which, in the north-west and in the peninsula of India, kateera is substituted. Produced by Cochlospermum gossypium, and in Pegu, according to McClelland, by several species of Sterculia. Dr. E. Dickson, when in Koordistan, collected plants which he ascertained to yield tragacanth. Dr. Lindley determined that the white or best variety is yielded by A. gummifer, and the red or inferior kind by his A. strobiliferus. Dr. Dickson observed a third variety that gave gum tragacanth. Gum tragacanth is largely employed in calico printing, and it has many uses in the arts and in pharmacy. The finest kind occurs in twisted, vermicular, rounded or elongated pieces, almost transparent, whitish, brittle, inodorous, with a slightly bitter taste. It is also found in large tears, of a vermicular form, a reddish colour, and mixed with impurities ; the former, the vermiform, being the variety usually brought to England, while the latter is commonly employed on the continent.—*McCulloch. Royle Materia Med. McClelland, O'Shaughnessy, Ainslie. Waterston quoted by Faulkner.*

TRAGELAPHUS HIPPELAPHUS. OGILBY, syn. of Portax pictus, the Nil-ghai of India. See Nilghai, Portax.

Kanchkoori ki jar,	DUK.	Casaghinnie,	SANS.

This plant, belonging to the order Euphorbiaceæ, occurs throughout British India. Its hair stings like that of the common nettle. The dried root has but little taste or smell, though with an agreeable odour when fresh. It is considered as diaphoretic and alterative, and is prescribed in decoction together with other articles of the same class. An infusion of it is also given in fever.—*Ains. Mat. Med. p.* 114.

The hairs sting violently ; the roots are given by the hindu herbalists, styled Baid, Vytia, and Vaida, as an alterative in cachexia and venereal diseases, for altering and correcting the habit in cases of mayghum (cachexia) and in old venereal affections attended with anomalous symptoms. Rheede, speaking of the root, says, "Conducit in febre ossiura, ac servit pro pruritu corporis." He further adds in decocto data, urinam suppressam movet.—*Ains. Mat. Med. p.* 75. *O'Shaugh. p.* 652.

TRAGO-CAMELUS, syn. of the Nilgai, or Portax pictus.

TRAGOPON. A genus of birds of the family Phasianidæ, T. duvaucelli, *Tem.*, now referred to the genus Pucrasia, is the Pucrasia macrolopha of Lesson, the purkhas pheasant of the Himalayas, and T. Hastingii, *Vigors*, is a synonym of Ceriornis melanocephala, *Gray*, the horned monal or Argus pheasant of the Himalayas.—*Jerdon.* See Birds, Phasianidæ, Pheasants.

TRAGOPOGON PORRIFOLIUS. LINN.

T. sativus,	*Gat.*	Salsify	ENG.

A plant of the order Matricariaceæ, an excellent vegetable cultivated for its white roots which are mild and sweet flavoured; requires culture similar to carrots ; held in high estimation by the French. The young shoots are sometimes used as asparagus, which in flavour they resemble. A native of England, raised from seed.—*Jaffrey.*

TRAGOPS BENNETTII, syn. of Antilope quadricornis, *Blainville.* See Antilope.

TRAGOSITA MAURITIANA, a beetle from the Mauritius, largely distributed through means of the sugar bags.

TRAGUS. See Rajpoots.

TRAI. PUSHT. Cucumis utillissimus.

TRAI BIDOK, and Trai phum, are buddhist works of Siam. According to the buddhistic doctrine, matter is eternal, the existence of a world, its duration, destruction and reproduction, all the various combinations and modifications to which matter is liable, are the immediate result of the action of eternal and self-existing laws. The Trai Phum is much venerated in Siam. It is not an original work, received among the immense collection of canonical buddhist books called Trai Bidok (in Burman, Bedegat), but a compilation made in the Buddhist era 2326. A. D. 1784, when the king of Siam, in the presence of his nobles and retinue, proposed a series of questions to the chief hierarch, priests and learned men, of which they were able to answer some but some they could not answer. —*Revd. J. T. Jones in Journal Indian Archipelago, Vol. V., No.* XI. See Bud'h.

TRAIGGUMA. See Kush.

TRAIL. A Japanese coin worth about 5*s.* 10*d.*

TRAMA. HIND. Caragana pygmæa.

TRAMPEL-THEIR. GER. Camelus bactrianus, *Linn.*

TRAMWAY, a railway constructed for slow traffic.

TRANQUEBAR, in lat. 11° 1′ N., long. 79° 55′ E., a town on the Coromandel coast, formerly a Danish settlement.

TRANNA. HIND. Vincetoxicum canescens.

TRANS, a Latin word in use amongst geographers of Europe, to indicate a country on the further side of rivers or mountains, as Trans-Indus, Trans-Himalaya. Cis, another Latin word, is used to indicate the countries or region on the nearer side, as Cis-Himalaya, Cis-Indus.

TRANS-INDIA. See India.

TRANS-INDUS SALT-MINES. In the southern Khuttuk hills are the salt-mines, situated near the villages of Buhadoorkheyl, Kurruck, and Lutumur. There is also a separate mine at Malgeen, a place lying east of Kohat. The headmen of these villages received a fixed percentage on the collections at the mines to obtain their good-will. The Sikhs never managed these mines at all. They farmed them out to some local chief, and left him to collect what he could. Under British rule, the control and working of the mines is in the hands of Government officers; the salt is excavated and sold at the mine at a fixed duty of two, three, and four annas per maund of 80 lbs., covering all expenses. See Khyber, p. 518.

TRANS-JAVAN or Timorian, see India.

TRANSMIGRATION. The Egyptians maintained that, after death, the immortal soul transmigrated into the bodies of birds, beasts, or fishes, and other animals, and that the gods took refuge in the bodies of animals, from the wickedness and violence of men. Pythagoras and after him Empedokles adopted these doctrines, and according to Heraclides, Pythagoras used to say of himself that he remembered not only what men, but what plants and animals he had passed through. Pythagoras said, he remembered that he had inhabited four bodies, and it is him whom Virgil means in these lines.

> "Ipse nam nemini, *Trojani* tempore belli,
> Penthoides, Euphorbus, eram."

and Empedokles declared of himself that he had been first a boy, then a girl, then a plant, a bird, and fish In the Tibetan bud'dhist creed, the doctrine of transmigration is shown, and final absorption into Buddha is put forward as the reward of a virtuous life. It follows that Buddha, with the Tibetans, is the divine being, who created all, and to whom all return, and that for the good there is no separate existence in a future world. There has been some misapprehension regarding the Buddhas and Bodhisatwas, the regeneration of the Grand Llama being considered as an exceptional case of a Buddha returning amongst mankind. Mr. Hodgson truly calls the divine Llamas of Tibet *Arhanta*, but he believes that a very gross superstition has wrested the just notion of the character to its own use, and so created the "immortal mortals, or present palpable divinities of Tibet." In the Nouv. Jour. Asiat. t. xiv. p. 408. ii, Fra Orazio says that "Lama sempre sara coll' istessa anima del medesime *Ciang-c'iub*, oppure in altri corpi." Remusat was not aware of this fact when he stated "Les Lamas du Tibet se considerent eux-memes comme autant de divinites (Bouddhas) incarnees pour le salut des homes." But the explanation which Major Cunningham received in Ladak, which is the same as that obtained by Fra Orazio in Lhasa, is simple and convincing. The Grand Llama is only a regenerated Bodhisatwa, who refrains from accepting buddhahood, that he may continue to be born again and again for the benefit of mankind. For a Buddha cannot possibly be regenerated, and hence the famous epithet of SATHAGATHA, "thus gone," and SUGATA, "well gone," or gone for ever.

In buddhism, one of the established laws is the belief in metempsychosis or the migration of the souls of animated beings; and the Tibetans believe in six forms in which a living being may be reborn, viz., Lha, *Tib*, Deva, *Sansk*, spirits or gods; Mi or men; Lha Mayin or evil spirits; Dudo or Johsong, brutes, beasts; Yidaga, imaginary monsters; and as the inmates of Nyalba or hell, or Naraka. All hindoos believe in the transmigration of souls. —*Hodgson pp.* 137, 138, *Sonnerat's Voyage, p.* 71. *The Bhilsa Topes by Major Cunningham, pages* 1 *to* 67.

TRANSOXIANIA, the Tajik aborigines are by the Turks styled Sart.

TRANSTULSTI. See Semitic races.

TRAO. HIND. Fagopyrum esculentum.

TRAP, in geology, is a term applied to old volcanic rocks which have flowed over or between other rocks assuming the form of stairs (trappa, Sw., a stair), and is distinguished as irruptive trap, overlying trap, interposed trap, and trap dykes. Trap, in its mineralogical structure, is greenstone, hornblende, or basalt. The greatest outburst of trap in the world, is that which was first described by Colonel Sykes, as the trap formation of the Dekhan. Volcanic trap is said to be visible in the bed of the Jumna, near Allahabad, in latitude 25° north. In the ascent to Mussoori, by Kuerkoolee granite makes a great eruption at the Chur Mountain, above 12,000 feet high, on the southern slopes of the Himalayas. But near Gungotri, at the source of the Ganges, is described to be the grand granitic axis of the Himalayas, and one of the greatest and most magnificent outbursts of granite in the world. It traverses these mountains in numerous veins—westwards towards the Barenda pass, and eastwards towards Kamet, Nandadevi and Nandakot, upraising the metamorphic schists which form the highest peaks of the snowy range. Lower down, on the southern slopes of those mountains, from 8,000 to 1,500 feet in height, uplifted stratified rocks rest on the gneiss and granite, consisting of hornblende rock and slate, limestone, sandstone, great beds of quartz, clay, mica, chlorite, and talc slates, and lower still, at altitudes of 3,000 to 2,500 feet above the level of the sea, gravel, boulders, marl with coal, recent clays and sandstones from the Sewalik or Sub-Himalayan mountains. It is in these hills that extensive fossil remains were discovered, and the low alluvial tract, known as the Terai, is the valley formed by the junction of the Sewalik with the Himalayan inclined rocks. To the south of this, the highest parts of Central India occur along the Aravalli mountains and the Vindhya range, from 2,300 to 3,000 feet in altitude. There are, here, three inclinations, the one declivity sinking from the Aravalli mountains towards the valley of the Indus, another falls from the Vindhya range northwards to the Ganges, and the third is southwards to the Nerbudda. Granite is here, also, the upraising rock; it bursts out at Oudeypore, Kaunmore, Banswarrah, and Rajpoor, through the gneiss, and mica, and chlorite slates, limestone and sandstone. It was to the east of this central tract that the first great deposit of coal was found lining both banks of the Damoodah, though it has, since then, been discovered in numerous other provinces of British India. In Central India, volcanic rocks, are observed to spread east and west from Neemuch in the form of basalt, basaltic greenstone, greenstone and greenstone amygdaloid, and southwards by Oujein and Saugor across the Vindhya, assuming the structure of columnar basalt in the steep descent to the Nerbudda. The trap crosses this river and spreads over all the Aurungabad province down through Candeish and the Concan to Bombay, and southwards to Malwan in latitude 60° north, its southern limits being observed south of Punderpoor, through Bejapoor to the right bank of the Kistnah, in the valleys near Homnabad, where it is found beneath but never penetrating the laterite hills south and east of Beder and at Maharajahpettah, thirty miles west of Hyderabad. The eastern edge of this vast tract of trap rocks, after crossing the Nerbudda to the south, skirts the town of Nagpore in Berar, passes Nandeir, and to the westward of the city of Hyderabad to its southern limit, just mentioned. South of this, as well as to the eastward, the trap only appears as great dykes, from fifty to a hundred yards broad, which run east and west parallel with each other. These dykes can often be traced for a hundred and fifty miles together, bursting through the granite and other rocks, tearing the highest of the hills asunder and filling the chasms and crevices with its dark and compact structure. In these dykes the elements of the trap rock assume a variety of appearances, greenstone, porphyritic greenstone, basaltic greenstone, hornblende rock, and basalt; they are particularly numerous in Hyderabad, the Balaghaut, Ceded Districts, the Carnatic and Mysore, almost to the southern cape of the peninsula, and with very rare exceptions, run due east and west.—*Balfour's Barometrical Sections of India.*

TRAPA. A genus of plants belonging to the Sub-order Trapeæ, the Hydrocaryæ water-nut tribe of plants, of which there are 1 genus and 5 species, 1 of Europe, Siberia, 3 from the East Indus, and 1 from China. There are two kinds, one with a hard thick shell, and the other with only a soft skin. The former, when ripe, has the appearance of a bullock's head, from two sharp spear-like projections growing from it. The fruit when boiled resembles a chesnut; the seed is made into a coarse flour, and cakes are made from it; both fish and tortoise feed upon the thin-shelled kind. In some parts of the country, great care is taken to preserve the seed for planting the following season, which is done by treading it into the beds of tanks

and such places. The fruit is fit to be taken at or about the close of the rains. They are sold in all the bazaars, and form a considerable part of the food of the inhabitants of Cashmere, where it yields the Government 12,000*l*. of annual revenue. Mr. Moorcroft mentions that Runjeet Sing derived nearly the same share. From 96,000 to 128,000 loads of this nut are yielded annually by the lake of Ooller alone. The nut abounds in fecula. In China, the kernel is used as an article of food, being roasted or boiled like the potato, and where the water is very shallow, a great part of it is covered with the Trapa, called "ling" by the Chinese. Mr. Fortune saw three distinct species or varieties, one of which has fruit of a beautiful red colour.—*Fortune, page 27. Royle, p.* 211. *Jaffrey. O'Shaughnessy, p.* 331.

TRAPA BICORNIS. A variety, distinguished from T. bispinosa by its two horns being recurved and very obtuse. It is carefully cultivated in lakes and ponds.—*Roxb.* i. 428.

TRAPA BISPINOSA. LINN.

Singhara,	BENG. HIND.	Gaunii	PUNJAB.
Sing.	CHIN.	Seringata	SANS.
Two-spined water caltrops	ENG.	Parike gadda	TEL.
		Pandi gadda	»
Pani-phal	HIND.	Kubjakam	,,
Karim-polam	MALEAL.	Sringa takamu	,,

This grows in both Peninsulas of India, in Bengal, Peshawar, Kashmir, in the Punjaub up to 5000 feet, and in Nepal. Its flowers are small, white, flowering in May and June, fruiting in the cold season. Its fruit is sold in the bazar and eaten by the natives, and in China, the Punjab, Kashmir and Guzerat it forms an important article of food. During the hooly festival, its flour is mixed with a dye procured from the flowers of Butea frondosa. The fruit in flavour resembles a chesnut, is eaten both raw and cooked, especially by the hindus of N. W. India, as it is phalahar, i. e., may be eaten in their fasts. It abounds so much in starch, that it may be easily separated from the seeds. In Kashmir, miles of the lakes and marshes, &c., are covered with this plant. Moorcroft states that in the valley it furnished almost the only food of at least 30,000 people for five months of the year, and that from the Wular lake, ninety-six to one hundred thousand ass-loads are taken annually, the Government drawing 90,000 rupees duty on it, and maharajah Rungit Sing got more than a lakh of Company's rupees from this. In the N. W. provinces, the cultivation of the species is extensively carried on by the Dhimar castes, who are everywhere fishermen and palankeen bearers, who keep boats for planting, weeding, and tending this water crop. The holdings of each cultivator are marked out in the tank by bamboos, and they pay so much the acre for the portion they till. The rent paid for an ordinary tank is about Rs. 100 a year, but Rs. 200 or 300 are paid for a large tank. But the plants cause such an increase of mud, that a tank is quickly spoiled by them, and the cultivation is not allowed where the tank is required as a water reservoir. The singhara is planted in the month of June, and is ripe in November; the deeper the water the better the crop. Green singhara sells at one maund of 24 seers per rupee, and dry at 18 seers per rupee. Singhara flour sells at 8 and 10 seers per rupee. The produce of one seer of seed in a good season is about 20 maunds. The water nut is as regularly planted and cultivated under a large surface of water, as fields of wheat or barley on the dry plains. The long stalks of the plants reach up to the surface of the water, upon which float their green leaves; and their pure white flowers expand beautifully among them in the latter part of the afternoon. The nut grows under the water after the flowers decay, and is of a triangular shape, and covered with a tough brown integument adhering strongly to the kernel, which is white, esculent, and of a fine cartilaginous texture. The nuts are carried often upon bullocks' backs two or three hundred miles to market. They ripen in the latter end of the rains, or in September; and are eatable till the end of November.—*Roxburgh* i. 428, *Voigt* 35, *Sleeman's Rambles and Recollections of an Indian Official, Vol.* 1, *p.* 102. *Powell, Dr. J. L. Stewart.*

TRAPA NATANS. The European species is said to be grown also in China. It is remarkable for its fruit with 4 spines, being of a blackish colour and large size, its seed is good to eat, whether raw, roasted, or in soups, and is somewhat like a chesnut in taste. It was known to the Romans by the name Tribulus. Pliny says (lib. xxi. c. 58), "about the rivers Nilus and Strymon the inhabitants gather it for their meat."—*Eng. Cyc. Fortune, p.* 27. *Honigberger,* 359.

TRAPA QUADRISPINOSA, ROXB. This plant is grown in Silhet, and its fruit is like that of T. bispinosa, *Roxb. Fl. Ind,* i. 430.

TRAPOS, also Andrajos. SP. Rags.

TRAP TREE. A species of Artocarpus? which furnishes the gutta used as bird-lime. The fibre of the bark is used for fishing lines, cordage, and nets at Singapore.—*Royle.*

TRAP-TUFFA. A curious variety of trap-tuffa, sometimes white, sometimes greenish or purple, found in Bombay and many other parts of India, resembles laterite in the quality of being easily cut when raised, afterwards hardening on exposure to the air. It

is used as a building-stone, and suits well for basins, troughs, and aqueducts; it is not very extensively employed.

TRAPU. Sans. Tin.

TRASI. Jap. Jav. Trassi. Malay. Balachang.

TRASTULLI. It. Toys.

TRAUBEN. Ger. Grapes.

TRAVANCORE. A tributary kingdom in the S. W. part of the peninsula of India. Its population is 1,262,647; Europeans 112, East Indians 1,737, Roman Syrians 81,886, Syrians 209.123, Jews 114, Slaves 143,863. It is ruled by the Nair, a hindu race whose descent is from the female side, a rule which most of the population also follow. The bulk of the population is hindu, but a considerable number of mahomedans, called Moplah (Mapillai), also occupy the country, engaged in commerce. It is a fertile, well watered country, with numerous marine lagoons. The rajah resides at Trevandrum. Travancore, Cochin, Malabar, Ceylon, the Malay Peninsula, Chittagong, Bengal, and Lower Assam, correspond in climate to the Tropical and East-Indian Islands, Tropical Africa, Brazil, Guiana, West-Indies, and Florida. The mountains of Travancore form an isolated mass at the extreme south of Malabar, which they separate from the districts of Tinnevelly and Madura in the southern Carnatic. The Travancore group of mountains thus presents a striking analogy to the island of Ceylon in position and outline. The main chain runs southward for 150 miles to Cape Comorin, with occasional deep depressions, and terminates in a bold precipitous mass 3-4000 feet high, within three miles of the Cape itself. They are loftiest at the extreme north of the district, where they stretch east and west for sixty to seventy miles, separating the districts of Dindigul and Madura, and rising into peaks of 8-9000 feet, which overhang the plain of Coimbatore, and they retain an elevation of 5-6000 feet throughout their extent to the southward. The western coast of India includes Travancore, Cochin, and Malabar, and comprises a strip of land of various width lying between the sea on the western side of India, and the range of Western Ghauts, which it includes. It is mostly undulating or hilly, almost everywhere covered with jungle of every description, from low bushes to the most lofty forest trees: most of the roads here too are lined with splendid avenues of banian, cashew, and various other fine trees. The climate is moist and comparatively cool. The Wynaad district, and generally the wooded parts bordering the summit of the ghauts, may also be included in this, which they resemble in climate and productions, though more correctly they belong to the next division. The cardamom hills, in Travancore, are the southern continuation of the Western Ghauts. At the Madras Exhibition of 1855, a valuable drug collection was exhibited from Travancore of 241 specimens, Star Aniseed, Galls, Wood Aloes, Butea Kino, True Kino, Mutty Pal, the root of a Smilax, which was reported to be a good substitute for Jamaica sarsaparilla, Cocculus Indicus, Nux vomica, Zedoaria, Croton tiglium, Aristolochia Indica, Curcuma montana, &c.. Amongst the fibrous plants of Travancore, are Ailanthus Malabaricus, Paroo-marum, Malayalum, Crotalaria juncea, and the Agave Americana. Travancore was estimated by Hamilton to contain 6000 square miles. See Hindoo, India, Jews, Kerala, Kotaur, Kranganore, Kummaler, Malabar, Nair, Polyandry, Teer.

TRAVANCORE FLAX. Crotalaria juncea.

TRAGACANTH. The false tragacanth of commerce is the gum of Sterculia urens: another sort is that of Cochlospermum gossypium. See Gum Tragacanth.

TREBECK, a companion of Moorcroft, died at Muzar, a town of 500 houses within the limits of the khanate of Balkh. He left a favourable impression amongst the people of the countries through which he passed. Mr. Moorcroft set off on his journey at the end of 1819, accompanied by this young man, Mr. George Trebeck, only on the threshold of the world.—*Moorcroft's Travels*, i. *p*. 24.

TREBIZOND is said to have been founded 707 B. C. by a colony from Sinope, the capital of Pontus. It derived its wealth from the munificence of the emperor Adrian. It was taken and pillaged in the first expedition of the Goths from the Ukraine in the reign of Valerian. It now contains about 80,000 inhabitants.—*Vigne, vol*. i. *p*. 6. See Kermanshah.

TREBJE. Rus. Rags.

TREBOL. Sp. Clover seeds.

TREDA. Hind. A variety of sugar-cane.

With every ancient race in all countries there have been sacred trees, such as the Tree of Life of Paradise, the oak of the Druids, the pipal of India, beneath which Vishnu was born, and the Tauba tree of mahommedans. See Hosea iv. 13. The Chaldeans, Hebrews, Greeks, Romans, and Druids had each their groves, their elms, and their oaks, the Singhalese have still their Bo tree, and the brahmans their Kalpan tree. The reverence paid to trees seems nearly as ancient and widely diffused as any other form of superstition. The Hebrew scriptures allude to it in many places; we find it mentioned by Greek and Roman authors; various anecdotes respecting it occur in Eastern manuscripts. It was under the oak of Mirah that Joshua (Josh. xxiv. 26) set up the great stone containing the written law, and Abimelech was made king by the men of Shechem, (Judges ix. 6,) and possibly that under which Rehoboam (1 Kings xii. 1) met the people. Besides that which stood "in the midst of the garden of Eden," emphatically styled "the tree of life" and another "the tree of knowledge of good and evil," the Biblical reader will recollect the idolatrous worship in groves, and under every green tree. The oak by Shechem, under which Jacob hid all the idols and ear-rings; the oak near Bethel which marked the grave of Deborah, and was significantly called Allon bachuth; the palm-tree under which another Deborah, the prophetess, dwelt; the oak under which sat "the man of God" (1 Kings xiii. 14); the oak in Ophrah, under which the angel of God appeared unto Gideon, and conversed with him: these, and the oaks, poplars, and elms, because the shadow thereof is good; also the humble bush, in which the Lord revealed himself to Moses in flaming fire on the mountain of Horeb. (Exod. iii. 2.) We read also in Genesis (xviii. 1) that the Lord appeared unto Abraham in the oaks, or at the oak of Mamre, for so the Hebrew text and the Greek Septuagint, (προς τη δρυι τη Μαμβρη) exhibit what in our English Bible is rendered "the plains of Mamre," and mention is made of "an oak that was by the sanctuary of the Lord" (Joshua xxiv. 26). Amongst the Romans, trees were consecrated to particular divinities. (*Virg. Ecl.* vii. 61.)

"Populus Alcidæ gratissima; vitis Iaccho,
Formosæ myrtus Veneri; sua laurea Phœbo."

In Pliny's Natural History, (Lib. xii. Cap. 1 "de arborum honore,") we read that Arborum genera numinibus suis dicata perpetuo servantur; ut Jovi esculus, "Apollini laurus, Minerva olea, Veneri myrthus, Herculi populus &c." Wreaths and fillets, and chaplets or garlands were often suspended from the sacred branches, whilst among some nations the practice prevailed of staining trees with blood, which had just flowed from the expiring victim, not unfrequently human. Lucan gives a description of the sacred wood near Massilia or Marseilles, (Phars. iii.)

"Lucus erat longo nunquam violatus ab ævo,
Omnis et humanis lustrata cruoribus arbor, &c."

Ovid mentions (Metam. Lib. viii. 689) the wreaths hanging from a sacred tree, and the addition of recent offerings;

————"equidem pendentia vidi
Serta super ramos; ponensque recentia dixi," &c.

And his story of Eresicthon, (Metam. Lib. viii), who impiously violated the ancient woods of Ceres, cutting down her sacred oak, which was in itself equal to a grove, and hung round with garlands, fillets and other votive offerings.

'Ille etiam Cereale nemus violasse securi
Dicitur, et lucos ferro temerasse vetustos.
Stabat in his ingens annoso robore quercus,
Una,nemus; vittæ mediam, memoresque tabellæ"!
'Sertaque cingebcut; voti argumenta potentis."

Statius (Theb. Lib. ii. 736, &c.) records a vow, promising that an hundred virgins of Calydon, who ministered at the altars, should fasten to the consecrated tree chaplets or fillets, white and purple interwoven—

"Centum ibi virgineis votæ Calydonides aris
Actæas tibi rite faces, et ab arbore casta
Nectant purpureas niveo discrimine vittas."

And the same poet gives an account (Theb. Lib. ix. 585,) of the celebrated Arcadian oak, sacred to Diana, but itself adored as a divinity, and so loaded with rustic offerings that "there was scarcely room for the branches."

"Nota per Arcadias felici robore sylvas
Quercus erat, Trivia quam desecraverat ipsa
Ejectam turba nemorum, numenque colendum
Fecerat
Vix ramis locus," &c.

There may also be noticed the *veternosis* in *arboribus* tænias of Arnobius (*Contr. Gent. Lib.* i.), and the *arbor* vittata, of Prudentius (*Contra Symmachum, Lib.* ii.); the sacred tree bedecked with fillets or garlands.

Mr. Morier in the account of his "Journey" (Vol. i. p. 230), mentions that close to the tomb of a Persian saint was a small bush on which were fastened various rags and shreds of garments; which were generally fancied to have acquired from their vicinity to the saint, virtues peculiarly efficacious against sickness. In the seventeenth century, it was remarked by Chardin at Ispahan, that the religious mahommedans chose rather to pray under a very old tree. He noticed, also at Ispahan, a large and ancient Plane tree all bristling with nails and points, and hung with rags, as votive offerings from dervishes, who like monks of the Latin church, were professed mendicants. Throughout all Persia, adds Chardin, these darakhat-i-fazel are venerated by the multitude, and they appear all stuck over with nails used in fixing on them shreds of clothes and other votive offerings. Herodotus remarks that Xerxes, when crossing the river Meander, and proceeding on the road, to the city of Callatebos, found a plane-tree, which on account of its beauty, he decorated with golden ornaments; and leaving to guard it one of his troops, called the Immortals, advanced, on the next day, to Sardis the chief city of the Lydians. It is not merely in case of sickness, (though a very frequent occasion) that the modern Persians invoke the spirits supposed to dwell in certain trees, by hanging on the branches pieces torn from their garments; but, on every undertaking which they deem of magnitude, such as a commercial or matrimonial speculation, the building of a new house, or a long journey, and now, as almost six hundred years ago, when Sadi wrote his work, offerings are daily made by votaries desirous of having children. A tree called in Persian Dib-dar, Div-dar, and Div-daru, which may be literally translated the "Demon-tree," bears also, in Arabic, a name nearly equivalent, Shajarat al jin, or "Tree of the Genii;" and even Shajarat Allah or "God's Tree," a tree resembling the Kaj, or Senuber-Hindi, a wild pine or Indian fir; or, as some say, a kind of Sarv or Cypress. The Cypress tree of Soma in Lombardy is said to have been full grown in the time of Julius Cæsar. We have the Oak of Ellerslie, and the Conqueror's Oak in Windsor Forest. And amongst ancient trees, we have the Baobabs of Senegal, the Eucalyptus of Tasmania, the Dragon tree of Orotava, the Wellingtonia of California, and the Chesnut of Mount Ætna.

The Bo tree at Anarajapura in Ceylon was planted 288 years before Christ, and is now 2150 years old. The yew trees of Fountain Abbey are believed to be 1200 years old. The olives in the garden of Gethsemane were full grown when the Arabs were expelled from Jerusalem. Rashid ud Din writing A. D. 1310, mentions the existence of a tree at the confluence of the Jumna and the Ganges, which still exists, but is now enclosed by part of the fortifications.

Amongst the Celts, the wychelm, elder, and mountain ash seem to have been regarded as possessing occult powers. Under the elm as well as under the oak, the Jews performed ceremonies and burned incense. Hos. iv. 13, Ezek. vi. 4-16, Is. i. 29 and lvii. 5, 6. Asherah, rendered groves in 1st Kings xviii. 19, 2nd Kings xxiii. 7, was a wooden image, not in the human form. The planting of trees to afford shade to travellers is deemed an act of merit among the hindoos, and, in a hot climate like India, deserves to be classed among commendable actions. Some trees are also considered as sacred, and the planting of them, therefore, deemed a religious act. The trees thus planted are generally the Ficus religiosa, Ficus Indica, Ægle marmelos, Jonesia asoca, Mimusops elengi, Ficus venosa, Ficus glomerata, Dalbergia sisso, Xanthochymus pictorius, Melia azadirachta, Michelia champaca, Mesua ferrea, Borassus flabelliformis. At the time of planting these trees, no religious ceremony takes place, but when they are dedicated to public or sacred uses, the ceremony called prutisht'ha is performed. The person who plants one ushwut'hu, one nimbu, two chumpuku, three nagukeshwuru, seven talu, and nine cocoanut trees, and devotes them with their fruit, shade, &c., to public uses, is promised heaven. Digging wells made a man famous in patriarchal times: a well, said to be Jacob's well, existed in Samaria at the commencement of the Christian era. John iv. 6, 12.

Throughout India, the worship of trees has been a very early and widespread superstition, and continues up to the present day. Everywhere, from Tibet to Cape Comorin, are to be seen trees covered with rags. The demons in whom the non-Aryan races believe, are supposed to take up their dwellings in trees. The hindoos, who believe in spirit-worship, invoke their deceased parents beneath the banyan or pepul, the Indian and religious fig trees. The Nerium odorum, Guettarda speciosa, Calophyllum inophyllum, Chrysanthemum Indicum, Origanum marjoranum and Artemisia astriaka, are sacred to Siva and Vishnu. The Tulsi is sacred to Vishnu, the Bel to Siva, the Shami and the Darlu to Ganpati. Every where in the East are to be seen old and withered trees half covered with rags, fastened as votive offerings to the branches, entitled by the Persians, dirakht-i-fazel, "excellent or beneficial trees," and held in superstitious veneration.

In Palestine also sacred trees are covered with rags. There was an ancient legend, that on the borders of India where oracular trees of the sun and moon that foretold the place and manner of Alexander's death, and the christian legend as to the Arbre sec, or Dry Tree, to which Marco Polo alludes, is probably that noticed by Klaproth from Chinese authorities, as on the N. W. frontier of the Cossaks of the Left, on the upper of the river Olie or Ori, to which, when the Cossaks pass, they kneel and worship.

Groves of trees were planted by the ancient Egyptians within the court-yards of their temples, but the laws of Moses (Deut xvi. 21,) forbade the Hebrews to plant any tree near the altar of the Lord, though the Alexandrian Jews, in later times, planted groves near their synagogues. Individual trees, throughout India, are regarded as habitations of spirits both good and bad, and noonday is the particular period at which their evil influence is exercised. In the Fiji islands, a fine grove exists in the Rew-a district, near the Mission station of Mataisuva, and at a point of the coast termed Na Vadra Tolu (the three screw-pines), probably from three Pandanus odoratissimus trees having stood there. Leaving the Mission premises, and keeping along the sandy beach, an enormous yevu-yevu tree (Hernandia sonora, *Linn.*) presents itself, forming a complete bower, which leads to a curious group of vegetable giants. A venerable vuturakaraka (Barringtonia speciosa, *Linn.*) more than sixty feet high, has thrown out several huge branches, two of which form, in connection with the stem, bold arches. Yesi (Afzelia bijuga, *A. Gray*), and Baka (Ficus) seem to have been those principally selected. The yesi furnished the best timber of the islands, and may, as the most valued tree, have been thought the fit residence of a god, as there is nothing in its appearance that is extraordinary, the beech most nearly resembling it in look. These sacred groves and trees are not worshipped as gods, but, as in the Odin religion, are looked upon as places where certain gods had taken up their abode.

Each of the Dii majores of the hindoos claim a peculiar tree. The Bar, Ficus Indicus, is sacred to Siva. The pepul, Ficus religiosa, to Vishnu, and the Dak, Butea frondosa, to Brahma. The Israelites had a custom curiously in accordance with the hindu practice of bearing trees on appointed days, as appears from the command given in the 23rd chap. of Leviticus and the 40th verse; "And ye shall take you on the first day, the boughs of goodly trees, branches of palm trees, and the boughs of thick trees, and the willows of the brook; and ye shall rejoice before the Lord your God seven days."

Travellers from Point de Galle to Colombo, in driving through the long succession of gardens and plantations of cocoa-nuts which the road traverses throughout its entire extent, will always observe numerous fruit trees of different kinds, round the stem of which a band of leaves has been fastened by the owner. This is to denote that the tree has been devoted to a demon; and sometimes to Vishnu or the Kattregam dewal. Occasionally these dedications are made to the temples of Buddha, and even to the Roman Catholic altars, as to that of St. Anne of Calpentyn. This ceremony is called Gok-bandeema, "the tying of the tender leaf," and its operation is to protect the fruit from pillage till ripe enough to be plucked and sent as an offering to the divinity to whom it has thus been consecrated. It is similar to the system of tabu of Polynesia. There is reason to fear, however, that on these occasions the spirit is, to some extent, defrauded of his due, as the custom is, after applying a few only of the finest as an offering to the evil one, to appropriate the remainder to the use of the owner. When cocoanut palms are so preserved, the fruit is sometimes converted into oil and burned before the shrine of the demon.

The Bo-tree of the Singalese, Ficus [illegible]giosa, is to be found within the precincts of every buddhist temple in Ceylon, and it is frequently met with in deserted localities, or near the sites of ancient villages; but the occurrence of a solitary Bo tree, with its circular buttress of stonework round the stem, indicates the existence, at some former period, of a buddhist temple in the vicinity. The planting of the Bo-tree in Ceylon, a ceremony coeval with, and typical of, the introduction there of buddhism, is one of the most striking passages in the Mahawanso; and a tree of unusual dimensions, which occupies the centre of a sacred enclosure at Anarajapoora, is still reverenced as the identical one which the sacred books record to have been planted by Mehindu 307 years before the christian era, consequently in the year 1900, it will be 2207 years old. So sedulously is it preserved, that the removal of a single twig is prohibited, and even the fallen leaves, as they are scattered by the wind, are collected with reverence as relics of the holy place. On the altars, at the foot of these sacred trees, the buddhists place offerings of flowers, and perform their accustomed devotions. Another account says, it was planted in the 18th year of the reign of king Deveniplatissa or B. C. 288. According to tradition it was beneath a Bo-tree that Gotama became a Buddha.

As in Judges iv. 5, 'And she dwelt under the palm tree of Deborah,' it is common for hindoos to plant trees in the names of themselves and friends, and some religious mendicants live for a considerable time under trees. The Kayoo To-joak in Singapore, is a dark-leaved small tree, to which superstition affixes a sacred character; most old and isolated trees are held to be kramat, or sacred, and small white flags are stuck up near them, and often propitiatory offerings made to the spirits supposed to reside on the spot.

Nothing irritates Burmese people more than to cut down fruit trees planted by their ancestors; these are the only things they possess in the shape of family heirlooms, which descend from father to son, and from mother to daughter. Women weep over this kind of destruction.

The extension of fruit-bearing trees amongst the people, is one deserving special attention. Advantages must arise to the great mass of the population from increasing the capabilities of the country in this respect. So large is the consumption of wood for fuel that, in the Meerut, Mozuffernugger, and Saharanpore districts, fine old mango trees, that form in groves (topes) the sole ornament of those parts, have been cut down. In Oudh, and in some parts of the North-western Provinces, the land revenue, it is believed, is partially remitted on lands covered with groves. In the Central Provinces large sums are annually spent in planting trees, but hitherto, except in some cases, the operations have not been very successful, as the climate militates very much against the establishment of trees unless they are constantly watered, and this is a most expensive operation. In Berar, revenue is remitted on land covered with plantations, but as under the ryotwaree system of land revenue, the trees, after 20 years, become, by the terms of the settlement, the property of the holder of the land, there seems no legal power of preventing their being cut down. In the Punjab, which is the most denuded of trees of any of the provinces of Upper India, Government is now spending nearly a lakh of rupees annually by direct agency on plantations. In the North-west Provinces also, a special officer has been appointed for the propagation of fruit trees at Raneekhett, for distribution over the country. Trees are of recognized value in inducing rain-fall and in preserving moisture.—*Ousely's Travels, vol.* i. *p.* 313, 387. *Tennent. Elliot's History of India. Ward's View of the Hindoos, vol.* ii. *p.* 83. *Quarterly Review, July* 1868. *Fiji Islands. Postans' Western India, vol.* ii. *p.* 178. *Tennent's Christianity in Ceylon, p.* 231-32, 335. *Hardy's Eastern Monachism, p.* 434. *Cameron. Milner's Seven Churches.* See Inscriptions.

TREEAQ-FAROOQ, of the bazars, is sold in little canisters, on which is printed in Persian, the Theriakh of Andromachi, &c. Marrubium vulgare, *Linn.*, and Teucrium chamædrys, *W.*, are two of the ingredients. See Mithridatum. Tiriaq.

TREE FERN. Alsophila gigantea, *Wall.*, also Cyathea arborea.

TREE GALANGA. See Camphor-wood.

TREE ISLAND, in lat. 1° 7½′ N., a bank of rocks west of Singapore.

TREE-LIKE-HIPPOCRATEA. Hippocratea arborea.

TREE-LIKE JASMINE. Jasminum arborescens.

TREEYAQ, or Tiriyaq. HIND. See Treeaq faruq.

TREFOIL, ALEXANDRIAN. ENG. Trifolium Alexandrinum.

TREFOIL CINNAMON. See Cinnamon.

TREKHAN. HIND. of HAZARA. Acer cultratum, maple, also A. creticum.

TREL. HIND. ? Dew.

TREMAL. HIND. Ficus Roxburghii.

TREMO. HIND. Ephedra Gerardiana.

TREE OF LIFE. The earliest representations of this are the date-palm, the fig, and the pine or cedar. The date palm is figured as a tree of life on an ancient Egyptian sepulchral tablet, certainly older than the 15th century B. C., now in the Berlin Museum. The cross amongst Buddhists and Manicheans is symbolic of the tree of life. It is described in the scriptures as growing in a garden planted by the hand of God, and it was connected with Adam's abode in innocence and immortality; but of another tree of good and evil also growing there, he was forbidden to eat. These grew in the garden planted for Adam's residence. The gardens of Alcinous and Laertes, of which we read in Homeric song, and not improbably that also in Babylon, were supposed transcripts of it. A sacred eminence in the midst of a superabundant, happy region, figures more or less distinctly in almost every mythology, ancient and modern. It was the Mesamphalos of the earlier Greeks, and the Omphalium of the Cretans, dominating the Elysian Fields, upon whose tops, bathed in pure, brilliant, incomparable light, the gods passed their days in ceaseless joys, and whither the disembodied spirits of the brave and good winged their way. It was the sacred Asgard of the Scandinavians, springing from the centre of a fruitful land, which, watered by the four primeval rivers of milk, severally flowing in the direction of the cardinal points, 'The abode of happiness and the height of bliss.' It is the Haramberezaitim of the Parsi, upon which the golden throne of Ahrimano is set, and at the base of which are ranged the glorious mansions of his Azad or ministering spirits, and of the blessed whom they serve. It is the Tien-chan, the celestial mountain-land, the enchanted gardens of the Chinese and Tartars, watered by the four perennial fountains of Tychin, or immortality; and the hill-encompassed Ila of the Singhalese and Tibetans, 'the everlasting dwelling-place of the wise and the just.' It is the Sumeru of the contemplative Buddhist, on the summit of which is Tawrutisa, the habitation of Sekra, the supreme god; and where the four-limbed

O'amba-tree perpetually blossoms, filling the surrounding atmosphere with life-sustaining odours, and from between the roots of which proceed the four sacred streams, running in as many contrary directions. It is the Slavratta, the celestial Vartha of the hindoo, the summit of his golden mountain Meru, the city of Brahma, in the centre of Jambadwipa, and from the four sides of which gush forth the four primeval rivers, reflecting in their passage the colorific glories of their source; and severally flowing northward, southward, eastward and westward. And, to conclude this enumeration of concurrent legends, it is that garden in the east, on the summit of a mountain of jacinth, inaccessible to the sinful Arab, 'a garden of rich soil and equable temperature, well-watered, and abounding with trees and flowers of rare colours and fragrance.' "Watered by rivers, its food is perpetual and its shade also :" "therein are rivers of incorruptible milk, the taste whereof changeth not ; and rivers of wine pleasant unto those who drink, with plenty of all kinds of fruit, and palm trees and promegranates."—*Eadie, Bible Cyclop. Sale's Koran ch.* xiii,xlvii, lvi. *Milner's Seven Churches of Asia.*

TREPANG. One of the Holothuriadæ, an edible sea-slug, called also Beche de mer, collected in large quantities throughout the Indian Archipelago, especially among the eastern islands. China is the principal, indeed, almost the only market. There are many varieties. Some sell at £9 7*s.* 6*d.* per 133⅓ lbs.; the trepang (Lotong) of Borneo at £4 3*s.* 4*d.* per 133⅓ lbs.; the trepang (Buangakulit) of Singapore £3 15*s.* 0*d.* per 133⅓ lbs.; the trepang (Pandans), of Borneo, £5 per 133⅓ lbs. See Holothuriadæ. Tripang.

TREPATTRA. HIND. Trifolium pratense.

TRERON PHŒNICOPTERUS of Upper India, and the Tr. chlorigaster of S. India and Ceylon, blend in Lower Bengal, for Tr. Malabarica. Tr. Pompadora. See Birds. Ornithology.

TRESUL, or trident, a weapon of Neptune, seems also that of Siva. See Trisula.

TRETA YUGA. SANS. from tree, three, and yuga, a definite period of time. The four yuga are numbered according to the quantity of religion in each ; thus the satya has four parts, the treta, three, the dwapara, two, and the kalee, one. The Treta yuga is the hindu silver age. See Surya-vansa. Yuga.

TRIKOOTA. SANS. from tree, three and kuta, a mountain peak.

TRIPOORANTAKA. SANS. from tree, three, pura, a house, and antaka, a destroyer.

TRIPOORA. SANS. from tree, three, and poora, a town.

TRIPOORA SOONDUREE. SANS. Sooonduree, beautiful.

TRISHIKHA. SANS. from tree, three, and shikha, the ascending flame.

TRIVENEE. SANS. from tree, three, and vinee, a stream.

TREVANDRUM. The chief town of Travancore.

TREVACARRY. In the chain of mountains which pass by Gingi, fossils are found. Those of Trevacarry, a village 21 miles from Pondicherry, are worthy of observation.—*Sonnerat's Voyage, p.* 5, 8.

TREVELYAN, Sir CHARLES EDWARD, K. C.B., of the Bengal Civil Service, wrote on the condition of the people of India, 1 vol. 8vo. Calcutta, 1839. He served in the Home Treasury Office, and in 1859 was Governor of Madras, from which Her Majesty removed him in 1860, on the grounds of his acting with less dependance on higher authority than was deemed expedient. He was subsequently Financial Secretary of India. Bold in design, energetic in execution, earnest in manner, thirsting for learning and knowledge, in conversation, he ever took for granted that all were equal to himself.—*Thurlow, p.* 34.

TREWIA NUDIFLORA. LINN.

Tetragastris ossea, *Gœrtn.* | Kaushi. MALEAL.

This tree grows on the coasts of India ; its root is used in medicine.

TRIAD. The triads of the gentile world are frequently resolved into corruptions of the doctrine of the trinity, revealed to the patriarchs, and preserved by tradition among the descendants in the scenes of their wide-spread dispersion. We repeatedly meet with a pagan trinity. The famous Siberian medal, now placed in the imperial cabinet of Petersburg, represents on one side a deity with three heads and six arms ; he sits cross-legged upon what Dr. Parsons calls a low sopha, or rather the symbolical lotus ; and on the reverse there is the following inscription, translated by Colonel Grant :—

> "The sacred image of God in three images :
> By these collect the holy will of God—
> Love him."

This medal has been supposed to have been brought from the empire of the Dalai-Lama in Tibet, but it seems to be the ordinary form of Vishnu, a hindu of deity. A triple god is described by Kircher among the Japanese, and the celebrated triad of the hindoos, Brahma, Vishnu, and Siva, is well known. At night and in the west, the sun is Vishnu ; he is Brahma in the east and in the morning ; from noon to evening, he is Siva. Maurice notices another triple god in India, compounded of Sre Mun Naraln, a beautiful woman, named Maha Lakshmi, and a serpent.

These persons are supposed by the hindoos to be wholly indivisible ; the one is three, and the three are one. A royal grant of land in Carnata, translated from the Sanscrit by Sir W. Jones, closes with the following inscription : "Sri Viru Pacsha !" or the god with three eyes.

Geryon, the three-headed, is famous in classical antiquity.

> " Qualis Atlantiaco memoratur littore quondam.
> Monstrum Geryones immane tricorporis iræ,
> Cui tres in pugna dextræ varia arma gerebant
> Una ignes sævos."
>
> " Thus on the coast, from hoary Atlas named,
> Stood triple Geryon : in his three right hands
> Three weapons fierce he brandished, vengeful fire."

The triad of the Greeks, so frequently referred to by Proclus, has been largely examined by Cudworth. The inhabitants of northern Europe had various trinities :

That of the prose Edda is Odin, Vilé, and Ve. Of the Voluspa, Odin, Hænir, and Ledur.

The Scandinavians swore by Odin, Freyr, and Njord.

The Nornir or Destinies were three. Among the Druids the number three was sacred and mystical : hence, their writing-rods of three sides, and the fondness of the ancient British bards for the triad, tribanau or triplet,

> Eiry mynydd—gwaugeus Iar—
> Gochwtbau gwynt ar dalar—
> Yn yr ing gorau yw'r Car.
>
> " Snow of the mountain ! the bird is ravenous for food—
> Keen whistles the blast on the headland—
> In distress the friend is most valuable."

The Triad of the Assyrians was Ana, Belus, and Hea.—*Parson's Remains of Japhet, chap.* 7. *Von Strahlenberg's Intro. to Descrip. of Siberia. Sir W. Jones on the Gods of Greece, &c. Asiat. TRIAD of the Chinese. In the bosom of the sceptical and avaricious Chinese people, there has always remained a powerful and vivacious spark that the Tartar government has never been able to extirpate, and secret traid societies have been formed all over the empire, the members of which have seen with impatience the Mantchu domination and cherished the idea of overthrowing it to obtain a national government.—*Huc Chinese Empire, vol.* i. *p.* 1384.

TRIANGLE. This, in hindu mythology, when the apex points downwards, is symbolical of Vishnu, considered as the principle of [illegible]; to descend being the property of water, and it naturally assumes that figure : when with the apex upwards, it is a symbol of Siva, as fire, it being the unvaried form of the igneous element.—*Moor's Pantheon page* 23.

TRIANGULAR SPURGE. Euphorbia antiquorum, *Linn.*

A troublesome weed, springs up everywhere ; the young leaves used as spinach, when somewhat old mixed with others and used as greens. The root is found in bazars ; colour pale, much wrinkled, bitterish, and rather nauseous to the taste, is considered cathartic, and given in powder to the extent of two teaspoonsful twice daily with a little ginger. The fresh root also is given as a cathartic mixed with ginger.—*Jaffrey, O'Shaughnessy, page* 353.

TRIANTHEMA PENTANDRA, var. obcordatum, *DC.* syn. of Trianthema obcordatum, *Roxb.*

TRIAS OBLONGA. Many of the mango trees have this species of Trias growing on them. It is the smallest plant of the orchid tribe in the Tenasserim Provinces.—*Mason.*

TRIBRI. HIND. Cucumis sativus.

TRIBULUS, of Pliny, is the Trapa natans or European water chesnut. Two species of Trapa vegetate at Lahore and Cashmere, and afford a considerable revenue, principally to the Cashmerean government. The water-nuts are boiled, and so sold in bazars. A poultice of Trapa natans is recommended to resolve indolent tumors, probably Trapa bispinosa would serve the same ends.—*Thirty-five Years in the East, by Dr. Honig. p.* 359.

TRIBULUS, a genus of plants belonging to the Nat. Ord. Zygophyllaceæ, of which Tr. alatus, Tr. lanuginosus, Tr. cistoides, *L.*, and Tr. terrestris occur in India. One or other species is common in the plains, some occur to from 3,000 to 5,000 feet in the Himalaya, and one is found to 10,500 feet in Tibet.—*Dr. J. L. Stewart.*

TRIBULUS CISTOIDES. LINN. A plant of the W. Indies grown in the gardens of India ; it has some aperient properties.—*Roxb. Voigt.* 184.

TRIBULUS LANUGINOSUS. LINN. *Roxb.* ; *W. & A.* ; *W. Ic.* Woolly caltrops.

Bhukri,	„		

The woolly caltrops grows throughout India. It has large bright yellow sweet scented flowers, and it fruits all the year round. The generic name is from the Greek τρίβολος, three spiked or three pointed. This is often confounded with the Pedalium murex. It is universal over the ground in Rajwarra. The seeds and capsules are highly mucilaginous. It is a common annual with yellow flowers and angular thorny fruit. Leaflets are eaten mixed along with others in time of scarcity. It is used in Cochin China as an astringent, in the south of Europe as an aperient and diuretic.—*Jaffrey. Eng. Cyc. Ainslie's Mat. Med. p.* 252. *Riddell. Gen. Med Top. p.* 193.

TRIBUTARY MAHALS. See India.

TRIBUTE is paid by many eastern nations. About fifty thousand Mons or Peguans pay tribute to Siam, and between latitudes 3° and 7° N. the Malays in the principalities of Patani, Calantan, and Tringanu on the east, and on the west those of Quedah and Perak, are subject through the governor of Ligor to the Siamese sovereignty ; but that sovereignty is by no means undisputed by the inhabitants in the less accessible parts.—*Bowring's Siam, vol.* i. *p.* 83.

From the berry of this thorny plant is prepared a warm oil, which the native practitioners consider as a valuable application in chronic rheumatism and paralytic affections. —*Ains. Mat. Med. page* 74, *Roxb. Voigt.* 138.

TRICHINOPOLY, in L. 10° 49·8′ N., and L. 78° 40·9′ E., in the Carnatic, a large military station. The land tripled in value in the twenty years ending 1870. The Dak bungalow is 297 feet above the sea. It is a large town on the Cavery river, which gives its name to a revenue district of the Madras Presidency. The country is flat and well irrigated by channels from the Cavery, which divides at Trichinopoly, and forms the island of Sri-rangam. The northern branch called the Coleroon flows to the ocean, but the southern is crossed by an anicut. The district contains 709,196 inhabitants and the town about 60,000. See Jalicut, Kollari.

TRICHIURUS LEPTURUS. LINN. The silvery hair-tail is one of the largest of the flattened small scaled fishes. It occurs at Shantung in the gulf of Pecheli in China, in N. China, and Corea, and is largely salted, dried and eaten. It is captured near the surface.

TRICHOCOMA PARADOXUM. See Fungi.

TRICHODESMA. The species of this genus are deemed diuretic, and are supposed cures for snake bites.—*O' Shaughnessy, p.* 467.

TRICHODESMA ZEYLANICA. R. BR. syn. of Borago Zeylanica, *Linn. Roxb.*

TRICHODESMIUM EHRENBERGII, and T. Hindsii occur in India. During the year 1823, Ehrenberg spent several months on the borders of the Red Sea, at Tor, very near Mount Sinai, and there witnessed the surprising phenomenon of the blood-red coloration of the entire bay, which forms the part of that town. The open sea, outside the coral reef, was of th[illegible]ry colour, but the short waves of th[illegible]ea bore to the shore, during the heat [illegible]y, a mucilaginous matter of a blood-r[illegible]r, depositing it on the sandy beach, so that in the space of little more than half an hour, the entire bay was margined by a red border many feet in width. The coloration was owing to minute almost invisible flocci, some greenish in colour, others of an intense green, but mostly of a deep red : the water in which they floated was, however, perfectly colourless. This very interesting phenomenon, explaining so satisfactorily the etymology of the name this sea has received, (an etymology which has hitherto remained in complete obscurity), during several days was investigated at leisure with every possible care. The colouring matter was examined with the microscope. The flocci were found to be composed of little bundles of oscillatoria-filaments ; they were in shape fusiform or elongated, were irregular, rarely more than a line long, and were invested with a kind of mucilaginous sheath. The flocci themselves did not exactly resemble one another, nor did they contain filaments. Whilst the sun was above the horizon, the flocci remained on the surface of the water in the glasses he had brought up ; during the night they sank to the bottom, or when he shook the glass, though remounting to the surface some little time afterwards. Two minute species of Trichodesmium collected in the Atlantic imparted a cloudiness to the water over a very large area, but were not coloured. They were so diffused that it was difficult to collect the excessively minute flocci, far smaller than those at Colombo, and colouring the sea there. —*Ehrenberg on the coloration of the Red Sea in Poggendorf's Annals. Annals and Magazine of Natural History. Ceylon Observer.*

TRICHOGLOSSUS ENTELES, and T. iris, the pretty little lorikeets of Timor.

TRICHOGLOSSUS ORNATUS, of Celebes, a beautiful brush tongued paroquet.

TRICHONOTIDÆ, a family of fishes including the genera Trichonotus, 1 Hemerocoetes.

TRICHOON KARKA. ROTH. syn. of Amphidonax karka, *Lindl.* Arundo karka, *Royle.*

TRICHOPODUSTRICHOPTERUS. PALLAS. Like the rest of the family, this species is capable of sustaining life out of water, particularly if kept in wetted fresh leaves, or occasionally sprinkled with water. At Penang it is numerous in streamlets and ponds, where it is eaten by the poorest classes. The exquisite beauty of the metallic iridescent colours make these fishes acquisitions in garden tanks. Like Osphromenus olfax they are very pugnacious among themselves. A species of Trichopodus was discovered by Dr. Campbell in the rivers of the Sikkim passes in the northern frontier of Bengal.

TRICHOSANTHES, a genus of plants belonging to the Cucurbitaceæ, and of which six East Indian species, anguina, bracteata, cordata, cucumerina, dioeca, and heteroclita are known ; some are used as vegetables, but others contain a purgative principle. T. amara, of St. Domingo, has bitter and astringent seeds, sometimes emetic.—*O' Sh. p.* 209.

		Polla kaya,	,,

The snake gourd is generally cultivated for its long snake-like fruit used in curries, and often cut into lengths and filled with a preparation of minced meat. This is sown in the rains, and grown generally over a high pandall, in order that the fruit may have space to hang down ; a small stone or weight is tied to the end to increase its length, which varies from a foot and a half to three feet or more. Raw, it resembles a cucumber in flavour, but is better dressed in a stew or curry. This curious contorted gourd is peculiar to India, and is in very general demand for vegetable curries. The plant is of easy culture and is to be seen on trellises around the doors of the native cabins ; the fruit grows beautifully striped, small, and tapering, so that hanging down from the trellis, they look like striped snakes suspended from the foliage of trees.—*Riddell, Jaffrey, Mason. Voigt.* 57. *Roxb.* 3. 701.

This plant grows in the valleys of the Himalayas, in hedges in Bengal, in the two peninsulas of India, and in Tenasserim. Its unripe fruit is very bitter, but is eaten by the natives in their curries, and is reckoned anthelmintic.—*Roxb.* iii. 702. *Voigt.* 57. *Mason. O'Shaughnessy* 350. See Cucurbitaceæ. Gourds.

TRICHOSANTHES DIOECA. Roxb.

Bun-putol.	Beng.	Kommu potla.	Tel.
Pulwul.	Hind.		

This occurs wild in Bengal, but is cultivated there for its unripe fruit and tender tops, which are eaten in curries and reckoned very wholesome. An alcoholic extract of the unripe fruit is described as a powerful and safe cathartic in 3 to 5 grain doses, repeated every third hour till the desired effect is produced.—*O'Sh. p.* 350. *Gen. Med. Top. p.* 209. *Roxb.* iii. 701. *Voigt.* 58.

TRICHOSANTHES INCISA. Rottl.

Birme ke-jur,	Duk.	Chinna Avagooda vayroo,	Tel.
Sirroo Corruttivayr,	Tam.		

This has a light coloured and very bitter tasted root. Pounded small and mixed with margosa oil, it is applied to offensive sores inside the ears, and is also poured up the nostrils in cases of ozæna. The taste of the rind is singularly bitter, but in three grain doses, thrice daily, it produced no sensible effect.—*Ains. Mat. Med. pp.* 77, 114. *O'Shaughnessy, pp.* 349.

TRICHOSANTHES KAKI KONDA. Roxb. syn. of Trichosanthes palmata, *Roxb.*

TRICHOSANTHES LACINIOSA. Wight. syn. of Trichosanthes palmata, *Roxb.*

TRICHOSANTHES VILLOSA of Java, fruit acts like colocynth.—*O'Sh. p. 350.*

TRICOOR, a prefix of the toolam, an Indian weight.—*Simmonds' Dict.*

TRIDACNA, a genus of molluscs, the shells of which are the largest known amongst acalephous molluscs. They are all of tropical seas. There are six recent, and one fossil species. T. gigas is sometimes 4½ feet long, weighing 500 pounds. T. safrana is of a beautiful blue round the edges: a third species is T. squamosa.—*Figuier. Woodward.*

TRIDACNA GIGAS, the gigantic clam shell, was formerly of such value that the Republic of Venice presented one to Francis I, who gave it to the church of St. Sulpice in Paris, and it is still used there as a basin for holy water. Its shell is transversely oval, with great imbricato-squamous ribs, the scales short, arched, and lying near together ; the interstices of the ribs are not striated. The size and weight of this immense bivalve, the largest and heaviest known, combined with the beautiful marble-like appearance and whiteness of the inside of the valves, have always caused it to be sought for as an ornament for grotto-work or for garden-fountains ; and, indeed, the valve of a large individual forms a very picturesque basin for catching the clear falling water and transmitting it through the deep interstices of its indented edge to the reservoir below. This species can hardly have been the Tridacna of Pliny ('Nat. Hist.,' xxxii. 6) but his Pedalia or oysters a foot long, from the Indian Sea, may have been Tridacnæ of modern authors. At Carteret Harbour, New Ireland, the natives brought many very large individuals, whose flesh they ate raw. The species occur at Tongataboo, at the Moluccas, at Timor, and at Wagyou. It appeared always to inhabit rather shallow water.—*Eng. Cyc.*

TRIDACNES—— ? See Chamacea. Chamidæ.

TRIDACNIDÆ, a family of Conchiferous mollusca comprising the genera Tridacna and Hippopus.

TRIDANDI, a saiva mendicant, who carries in his hand three wands, to illustrate his command over his thoughts, words, and acts.—*Wils.* See Sanyasi.

TRIFOGLIO. It. Trifolium, Lat. Clover.

TRIFOLIUM, a genus of plants belonging to the natural order Fabaceæ. Several European and one Egyptian species are known. Tr. alexandrinum, frugiferum, arvense, glomeratum, incarnatum, lappaceum, maritinum, medium, michelianum, pratense, repens, resupinatum, spumosum, suffocatum, subterraneum, stellatum, and strictum. They are the trefoils or clovers, so largely used in Europe as fodder for cattle ; and Dr. Irvine mentions Tr. Indicum or Indian trefoil called in Hindi Bun-mether, Jhoonjoorie or Goolabe, as very common in Ajmeer, Marwar and Jaipoor. Camels are fond of it ; other cattle do not eat it. One of the European species, Tr. repens, the white or Dutch clover, is said to be the shamrock worn by the Irish as a badge. Leaves with three divisions have, from remote times, been regarded with superstitious reverence.—*Voigt. p.* 210. *Eng. Cyc. Genl. Med. Top. p.* 205.

TRIGLIDÆ, the gurnard family of fishes, of the order Acanthopterygii. The genus Trigla with bright colours occurs in British seas. The family is arranged into four groups. One genus Dactylopterus, of which there are four species, has two species, D. volitans of the Mediterranean and D. orientalis of the East Indies. The flying gurnards raise themselves into the air by means of their pectoral fins, and swing themselves forward for a hundred feet.

TRIGO. PORT. SP. Wheat.

TRIGO DE INDIAS. SP. Wheat.

TRIGONELLA. A genus of plants of the natural order Fabaceæ or Bean tribe; there are about thirty species, and Tr. cœrulia, corniculata, fœnum-græcum, and ornithopodioides occur in India.

This plant is a native of the south of Europe, but is cultivated in Asia Minor and in India. Mucilage, starch, fixed oil, and colouring matter, constitute the greater part of its seed, which are used by the native practitioners in dysenteric affections, cough and special diseases, and the Arabs employ it in poultices and fomentations. It is cultivated for a pot herb, considered very wholesome. It imparts a very strong odour and taste to curries, and the seeds are said to be slightly tonic. They are also used as coffee after roasting, and to form a yellow dye; and are said to be emmenagogue.—*Powell, Handbook p.* 339. *Ainslie's Mat. Med. p.* 269 *and* 257. *O'Shaughnessy, p.* 291.

TRIGONELLA TETRAPETALA. ROXB. syn. of Cyamopsis psoraloides.

TRIGONOMETRICAL SURVEY of India began at Cape Comorin in 1800. Its originator was Colonel Lambton, who has been succeeded by Sir George Everest, Sir Henry Waugh, Colonel J. T. Walker, and Colonel Thuillier, and about three-fourths of the whole of British India has been surveyed. It is calculated that by the year 1886, the whole of the vast area of India, 1,556,836 square miles, will have have been surveyed by the Grand Trigonometrical Survey, and by the Topographical and Revenue Surveys, though portions may require resurveying. In the triangulations of India, chains of triangles have been carried along the principal meridians, and the course of the eastern and western frontier, and these were connected together by other chains, the northernmost of which followed the Himalayan frontier line, while others were carried along certain parallels of latitude at convenient intervals. Colonel Everest's meridional arc is the axis of the system. Base lines are measured at the extremities of the longitudinal chains and at the points where the chains cross Colonel Everest's arc. The great quadrilateral figure which connects Debra Dhoon with Kurrachi comprises four base lines and about 2500 angles, appertaining to 8 chains of triangles.—*Ann. Ind. Admin.*

TRIKALA, of the Cis-Sutlej, is wheat and barley sown together. It is called "guji" in the Punjab.

TRIKALA MALLE. TEL. Malva rotundifolia, *Linn.*

TRIMBAL. HIND. of Kangra, Ficus Roxburghii, also F. macrophylla and F. venosa.

TRIMPALI. HIND. Manisurus granularis, *Linn.*

TRIMULGHERRY, a small hamlet eight miles N. of Hyderabad in the Dekhan, near which a cantonment for European soldiers has been located.

TRIMURTI, or three persons, the term employed to designate the triad of gods of the hindu mythology, Brahma, Vishnu and Siva, whose attributes are those of the Creator, the Preserver, and the Destroyer. The consorts of Brahma are Saraswati, Sakti or Maya; of

Vishnu, Lakshmi, Padma or Sri ; and those of Siva are Parvati, Bhawani or Durga. The attendant vahan or vehicle of Bramha, is a hanasa or goose : that of Vishnu is a garuda or bird, and nandi or the bull pertains to Siva. Meru is the station of Brahma, the sun that of Vishnu, and Jupiter that of Siva. The symbols of the three deities are respectively Time, Water and Fire. Their common titles A. U. M. are, for Brahma, Parameswara ; for Vishnu, Narayana ; and Mahadeva for Siva. Brahma is not now worshipped. Vishnu under the figure of the sun, by the Saligram and the nine Avatars, while the Lingam and his million epithets are the usual figures indicating Siva. Brahma of the hindu theology is supposed to be the analogue of the Saturn of the West, while Jupiter represents Vishnu and Siva. The tri-murti or three persons, or three forms, is known in the southern peninsula as mu-murte (mur, TAM. three.) In the philosophy of hinduism, not only Brahma, Vishnu, and Siva, but god and the world are one, but the Trimurti are far from being one, for the legends relate their fights and quarrels. Many saiva hindoos believe in the three as triune, but vaishnava hindus are rarely in accord in this, and the bulk of the hindu religionists regard Siva or Ishwara, Vishnu and Brahma or his essence, Parabrahma, as distinct deities.

Of this triad, the present hindoos scarcely recognize Brahma, who has at present not a single temple throughout all India. The worship of Vishnu seems to have come from Tartary, and that of Siva from the basin of the lower Indus through Rajputanah, and to have displaced the nature worship of the Vedas. In the present state of hinduism, however, every hindu has a separate belief, and Siva, Vishnu, hero-worship, the worship of incarnated beings, devil worship, the worship of the lingam, are the prevailing forms. Indra, once regarded as the king of heaven, is almost unheard of and unknown. Amongst the earliest dissenters from Indra were the Yadu race under Krishna's influence. The reasons leading him to this are not known, but the Maha Bharata make him say to Nareda, his father, Why worship Indra as the Supreme god? O father, we are Vaisyas and our cattle live upon the pastures, let us therefore cease to worship Indra, and pay our devotions to the mountain Govarddhana. Up to that time it was to the heaven of Indra that the good who died proceeded.

The two gods, Indra and Agni, rain and fire, were the chief deities worshipped by the Vedic Aryans : Indra, the sovereign of the gods, was the most powerful of the Vedic deities. He is the god of the firmament, the hurler of the thunderbolt, who smote the rain cloud, and brought down waters, who delighted in the Soma juice, in eating, in drinking wine, and in war. Indra is now never invoked, but has been succeeded by Vishnu and Siva.

Agni, another Vedic deity, is the personification of fire, and was worshipped as the destroyer of forests, as useful in the sacrifice and in the household. " When generated from the rubbing of sticks, the radiant Agni bursts forth from the wood like a fleet courser." " When excited by the wind, he rushes amongst the trees like a bull, and consumes the forest as a rajah destroys his enemies." " Such as thou art, Agni, men preserve thee constantly kindled in their dwellings and offer upon thee abundant food."—(*Rig. Veda* i. 73.)

Varuna was the Vedic god of the waters, and god of the ocean, but the name was sometimes applied to the sun and sometimes used a personification of day. As with other gods when addressed he was regarded as supreme, and capable of forgiving sin :—

> " Let me not yet, O Varuna, enter the house of clay ; have mercy, almighty, have mercy !
>
> If I go along trembling, like a cloud driven by the wind ; have mercy, almighty, have mercy !

* * * *

> Thirst came upon the worshipper, though he stood in the midst of waters, have mercy, almighty, have mercy !"

Surya, or the sun, called also Savitra, Mitra, Aryaman and other names, was a Vedic god, who continues to be worshipped down to the present day, by brahmins and zoroastrians. The solar race of Kshetrya who appear in the Ramayana, derive their origin from the sun ; but in the higher spirit, the sun is regarded as divine, as pervading all things, as the soul of the world and supporter of the universe. In a verse of the Rig Veda (iii, 62 and 10) this idea is supposed to be indicated. It is" O'm ! Bhurbhuvassuvaha, O'm ! Tatsa vithru varenyam, B'hargo, devassya dhimahi dhiyo yonaha pracho dayath : O'm! Earth, air, heaven, O'm let us meditate on the supreme splendour of the divine sun, may he illuminate our minds. And at the present day the most enlightened brahmans regard this verse as an invocation to the several deities who are implored by the worshipper to aid his intellect in the apprehension and adoration of God.

In connection with the sun are the twelve Aditya, sons of Aditi, the universe. In the later Vedic age, they were identified with the twelve signs of the zodiac, or the sun in its twelve successive signs. Soma, also Chandra, the moon, is chiefly celebrated in the Vedas in connection with the Soma plant, but in the Maha Bharata is the mythical progenitor of the great lunar race of Bharata. The Aswini, apparently a personification of light and moisture, as sons of the sun, also as the sun's rays, and noticed as the physicians of the gods. They are described as young and handsome and riding on horses. Vayu or the air, and the Maruts or winds, are personified and invoked. The Maruts are depicted as roaring amongst the forests, compared to youthful warriors bearing lances on their shoulders, delighting in the Soma juice like Indra, and, like him, the bestowers of benefits on their worshippers. Ushas or the dawn, the early morning, the first pale flush of light: Ushas is compared to a mother awakening her children ; to a lovely maiden awakening a sleeping world, to a young married maiden, "like a youthful bride before her husband, thou uncovereth thy bosom with a smile." As a goddess, she is styled the (*Rig. Veda* i. 123, *v.* 2) mighty, the giver of light ; from on high she beholds all things ; ever youthful, ever reviving, she comes first to the invocation."

Indra, according to Bunsen (iii. 587, 8, iv. 459), is the prototype of Zeus, and was a personification of ether. Soma was offered to him in sacrifice.—*Rig-Veda. Bunsen's Egypt.*

TRINAVINDHU. See Ravana, Suryavansa.

TRINCOMALLEE. A bay, harbour, and town in Ceylon. The flagstaff point is in lat. 8° 33½′ N., long. 81° 19′ E. It is high and covered with trees. The harbour and its bays form a capacious inlet. Trincomallee was taken by the British in the end of 1795, but Ceylon was incorporated after the peace of Amiens, 27th March 1802. The mean temperature of Trincomallee is 81½°, and its climate is so dry that occasionally there is no rain for nine months, both anomalous conditions when the proximity of the ocean is considered. Kandy, in the centre of the island, which is only 1800 feet above the sea, and is situated in a mountain valley, has a mean temperature of about 73°, and that of Newera Ellia, elevated 7000 feet, is probably about 60°.—*Hooker and Thomson.*

TRINCOMALLEE WOOD. Berrya ammonilla, *Roxb.*

TRINCUTTEE. See Nicobar Islands.

TRIND. HIND. Rosa macrophylla.

TRINGANU. A fertile and well wooded district, containing gold and tin, between the Malacca straits and the gulf of Siam, containing about 50,000 souls. Tin is used as money. See India, Jakun, Kedah or Quedah, Semang, Tringany River.

TRINGA. A genus of birds common in Europe and Asia. Tringa sub-arquata, the Curlew sandpiper, of the circuit of the northern regions, to beyond the equator and Australia, is very common in India.

Tringa canutus, the Knot, is of the circuit of the northern regions : rare in India.

Tringa platyrhyncha, the Broad-billed Sand-piper of Europe, Asia, Sumatra, Borneo, and Timor, not uncommon in India : rare in the U. S. of America.

Tringa minuta, the Little Stint of Europe and Asia, is very common in India.

Tringa Temminckii. Temminck's Stint of Europe, Asia, and N. Africa, common in India.

Tringa alpina, or Tringa variabilis, the Dunlin of the arctic regions, circuit of northern regions, Japan, Timor (Temminck) Guiana : is not rare in India.

TRINGANY RIVER, on the east coast of the Malay peninsula, in lat. 5° 21′ N., long. 103° 4′ E., has a little trade in pepper and gold, and refreshments are procurable for ships. The roadstead is safe from March to September. See Tringanu.

TRINGU-PITTAY. SINGH. Flour of wheat.

TRINI or Terni. HIND. The root of Calligonum polygonoides.

TRINITY of christians, God the Father, God the Son, and God the Holy Ghost. See Triad, Trimurti, Tree of Life.

TRINJAM. TAM. Cheiroptera. Bats.

TRINGLI BENG. HIND. Manisuris granularis

TRINRAGAN—? Palmyra palm.

TRIONYX. A genus of reptiles of the order Chelonia and class Testudinata ; the following species occur in India :—

Tr. sinensis, *Wiegm*, of China, Chusan and Formosa.
,, Gangeticus, *Cuv*, of the Ganges and Penang.
,, Javanicus, *Shweigg*, of the Ganges, Penang and Dekkan.
,, ornatus, *Gray*, of Siam and Cambogia.
,, sub-planus, *Schweigg*, of Singapore and Penang.
,, Guntheri, *Gray*; also Tr. Ægyptiacus, Euphraticus, Gangeticus, hurum, *Gray*, Javanicus, ocellatus, subplanus. See Chelonia.

TRIOSTEUM HIMALAYANUM. Discovered by Dr. Wallich's people at Gossainthan in Nepal.—*O'Shaughnessy, page* 377.

TRIOSTEUM PERFOLIATUM of United States is called fever root, and wild ipecacuan. The bark of the root is emetic and purgative, leaves diaphoretic, their efficacy impaired by age ; they should be preserved in closely stopped jars and changed annually. —*Lindley, Fl. Med. p.* 445.

TRIPANG. MALAY. Biche de mar. Mr. Crawfurd, after stating that the fisheries of the Indian islands form the most valuable branch of their commerce, and that a great variety of the fish caught are dried in the sun, observes that ordinary dried fish forms no portion of the foreign exports of the islands, but fish-maws and shark-fins are sent to China from the northern coast of Australia. The inhabitants of Celebes, receiving advances from the resident Chinese, have been long in the habit of making annual voyages thither in quest of tripang. Gutted, dried in the sun, and smoked, it is considered cured, and fit for its only market that of China, to which many hundred tons are yearly sent for the consumption of the curious epicures of that country. The fisheries of the tripang for China resemble that of the anchovy to the people of Europe. Some of them are of excellent flavour. Fish constitutes the chief animal aliment of all the inhabitants, and everywhere of those of the sea-coast who are by profession fishermen. Among the best fisheries are those of the eastern coast of the Malay peninsula, those of the entire Straits of Malacca, of the northern coast of Java, and of all the coasts of Borneo and Celebes, with those of the Philippine Islands. The taking of the mother-of-pearl oyster, the pearl-oyster in a few places, of the holothurion or tripang, and of the shell tortoise, form valuable branches of the Malayan fisheries.—*Crawfurd's Dictionary, page* 138. See Holothuriadæ. Trepang. Fisheries.

TRIPASSUR, in L. 13° 8′N., and L. 79° 53′ E., a town in the Carnatic twenty-five miles west of Madras. The level of the plain is 183 feet above the sea.

TRI PATTRA. HIND. Marsilea quadrifolia.

TRIPE DE ROCHE. Gyrophora.

TRIPHASIA TRIFOLIATA. *DC.*

Tr. aurantiola,	*Lour.*
Limonia trifoliata,	*Linn.*
China orange,	ENG.
Three leaved Triphasia,	„
L. diacantha,	*DC.*
Lime berry of Manilla,	ENG.
China naringi,	BENG

A very handsome shrub, with middle sized, white, fragrant flowers, and a bright red pleasant fruit, said to make good preserves. It belongs to the Citraceæ. Tr. monophylla, *DC.* occurs in Timor, and a species occurs in China and Cochin-China. The three-leaved triphasia bears a small berry, like an orange in miniature, often found in Chinese preserves. —*Mason, Voigt.*

TRIPATAKA. The sacred canon of the buddhists now extant, is called the Tri-pataka, i. e., the three baskets: the first basket contains all that has reference to Vinaya or morality, or discipline; the second contains the Sutra or discourses of Budd'ha; the third includes all works treating of dogmatic philosophy or metaphysics. The first and second each contain five separate works. The second is generally known by the name of Dharma or law; and it has become usual to apply to the third basket, which contains seven separate works, the term Abhidharma, or bye-law. The Sutra are ascribed to Sakya Muni. They consist of ethical and philosophical dialogues by Sakya, and they make mention of the gods Narayan, Jonardhan, Shib, Brahma, Petomah, Borun (Vorun), and Songkar, other names for Shib, Kubir, Sokr or Vasob, and Vissoo Kormo.

Mahinda, son of Asoka, is supposed to have brought the Attha-katta, ancient commentaries in Pali, to Ceylon, and to have translated them into Singhalese, which Buddhaghosha, about A. D. 430, re-translated into Pali. According to another account, the doctrines were first reduced to writing by the Ceylon priests during the reign of king Vartagamani, 88-76 B. C., and by a synod assembled 10-40 A. D. by the Turushka king Kamshka. For the former the language used was the vernacular, from which in the 5th century it was translated into Pali. For the latter, Sanscrit. Hardy, in his Eastern Monachism, has discussed the views held of Buddha in Ceylon; the changes made must have been very early, for eighteen heresies are deplored in the Mahawanso within two centuries from Sakya Sinha's death. In Ceylon, this faith has not been subjected to much persecution. In the 16th century, the Tamil invaders made every effort to destroy the books, but the priests sent missions to Siam, properly ordained priests were imported from Burmah; and by the 18th century, buddhism had regained its ascendancy. The priests latterly have been actively diffusing a knowledge of their creed. They have printing presses, from which tracts, pamphlets and serials issue in great numbers. They present some new and ingenious arguments, but the defiant and blasphemous expressions which they contain against the sacred name of Jehovah, are probably the most awful ever framed in human language.—*Cal. Rev.*

TRIPATY. A town about eighty miles from Madras, where there is an avatara of Vishnu, called Balaji. In Sanscrit this avatara is named Venkatesh; in the Telinga country and language, Venkatramma Govinda; in Gujerat and to the westward, Takhur, or Thakhur, as well as Balaji: the latter name obtaining in the neighbourhood of Poona, and generally through the Mahratta country. This incarnation took place at Tripaty, where, in honour of Balaji, on the top of a hill is a splendid temple, very rich, and much respected, with a revenue of one lac and twenty-five thousand rupees. All acts of this temple, to which an extensive district is attached, are carried on in the name of the sri-mahant. Pilgrimages are made to Tripati from all parts of India, especially from Gujerat, the trading inhabitants of which province, of the tribes of Bania and Battia, and others, are in the habit of presenting five or ten per cent. of their annual profits to this temple, whose deity appears to be the tutelary patron of traffic: rich gifts and votive offerings are likewise received from other quarters. In this avatara, Vishnu, in his form of Balaji, was attended by his sakti Lakshmi, and by another wife. Satyavama, and they are generally seen with him, as well as in his avatara of Krishna, with whom Satyavama appears to have been a favourite, we find her with Lakshmi, in immediate attendance on her divine spouse in his paradise of Vaikant'ha as well as participating with her favoured associate in promoting the tranquillity of the Preserver, while reposing on sesha, in chira-samudra, or the sea of milk. In this hindu temple, the image is seven feet in height, with four arms, and having in three of his hands the *chakra*, the *chank*, and the *lotus*, and the image is worshipped with those of Lakshmi and the serpent sesha. It is built of stone and covered with plates of gilt copper. The hill on which the temple has been built rises from a valley in the centre of a range of hills, the very sight of which, though at the distance of many leagues, is so gratifying to the hindu devotees, that upon first catching a glimpse of the sacred rocks, they fall prostrate, calling upon the idol's name. The early history of the pagoda is involved in the obscurity of Indian mythology and fable. Its antiquity is undoubted, and the brahmans assert that it was erected at the commencement of Kali-yug, of which nearly 5,000 years have expired. Oblations are offered to its god by Vishnu's votaries from all parts of the Indian world. Princes send their *vakils* or ambassadors to present their offerings to the shrine, and the poorer peasant, who may have less to offer, wraps up some petty oblation in a piece of wax cloth. The legend connected with these offerings is as follows: the idol, smitten with love for the blooming Judroavuttee, daughter of the rajah Akasha, determined to espouse her, but wanting money for the matrimonial expenses, he raised the wind by the aid of Kuvera, the Indian Plutus. This god, however, directed that the money thus lent should be repaid annually to the sovereign of the countries lying between the Palar and Soonamooki rivers; and the votaries at the shrine pour in, in great numbers, during the *Brumhantsaween*, or nine days' celebration of the nuptials; and, annually, at this period, two-thirds of the usual collections are made. These offerings are made generally from personal motives, and are of every conceivable diversity of articles: gold and silver lamps, coins of all sorts, bags of rupees, copper money, spices, assafœtida, the hair cut off the head, frequently vowed from infancy, and given up by some beautiful virgin in compliance with her parent's oath. A man who is lame presents a silver leg; if blind, a gold or silver eye. The jewels which a woman has worn with pride from infancy are voluntarily left before the idol. She appears with a shabby cloth before the image and presents a splendid one which has never been worn: she tears the bangles from her infant's legs and fondly hopes that the god will shower down his blessings on her and hers. She has, haply, travelled hundreds of miles to accomplish her object; and performed a journey which to her might, till then, have been one of terror, never before having left her village and the bosom of her own family. The birth of a son, reconciliation with enemies, success against a foe, safe termination of a journey, the marriage of a son or daughter, prosperity in trade, and enjoyment of health, are among the reasons which lead together, in the direction of Tripaty, the wise as well as the ignorant. The offerings are not always presented by the interested party: they may be sent by relations, friends, or vakils; but they are frequently forwarded by gosains. A few months before the Brumhantsaween these set out in different directions, and on reaching the place of pilgrimage, they unfurl the sacred flag of the god with which each is entrusted.—*Cole. Myth. Hind. p.* 158. *Moore's Hindu Pantheon.*

TRIPLE ENERGY, the Hermes Triplex of the Egyptians.

TRIPNO, this, in form, resembles the horoscope of almanacs, somewhat resembling the mahomedan "Takwim." The subject is the duration of the Yoga, Nakshatra, Tithi, Wara, and other astronomical divisions of time. The object of it is devotional.—*Richard F. Burton's Sindh, p.* 400.

TRIPOLI. A mineral, first brought from Tripoli and Africa. It is composed of silica, alumina, and oxide of iron, and consists almost entirely of fossil deposits of the siliceous coats of diatoms, which from their hardness form an excellent means of polishing metals, marble, glass, &c. These fossil deposits are very numerous and in great quantity in different parts of the world. The town of Richmond, in the United States, is built upon a stratum of these bodies twenty feet in thickness; in California and America generally, in Bohemia, throughout Europe and Africa, and, in Great Britain, we find similar deposits, varying in the different species present.—*Gosse's Natural History, p.* 27.

TRIPOLI, or three cities, is a word supposed to be derived from three colonies, which established themselves on this promontory, in three adjacent places, and not in one city. The present town is built at the foot of the lowest hills of Libanos, about half an hour's distance from the sea shore. The river Kadisha (Holy), otherwise called Nahr-Abu-Ali, flows through it, dividing the town into two equal parts, of which that to the south is the more considerable. It is enclosed by walls of no great height or strength. It is called Tarabolos-us-Sham, or Eastern Tripoli, to distinguish it from Tripoli in Barbary, which is called Tarabolos-ul-Gharb, or Western Tripoli.—*Robinson's Travels,* vol. ii. p. 69.

TRIPOLI SENNA. See Cassia plants.

TRIPUNDRA. Sans. A triple transverse line on the forehead of the worshippers of Siva. It is made with the vibhuti or ashes taken from the fire of an agnihotra brahman. or they may be the ashes of burnt cowdung from an oblation offered to the idol. See Gopi-Chandana. Vibhuti.

TRIPUNKHI. Hind. Coldenia procumbens, *Linn.*

TRIPURA. See India, Siva.

TRIPURA-SUNDARI. See Hindu.

TRISANKU, a prince of Oudh of the solar line, elevated to heaven during his life by the sage Visvamitra.

TRISIRAS. See Yama, Darmarajah.

TRISULA, the trident of Siva. It is considered to be in continual motion over the face of the universe to guard and preserve its creatures. To oppose its course would be to incur immediate death. Its motion would appear to be regular, but varying according to the days in the week. Thus it is imagined that it is unlucky to proceed towards the westward on Sundays and Fridays, to the northward on Tuesdays and Wednesdays, to the eastward on Saturdays and Mondays, and to the southward on Thursdays. The trisula or trident symbol of Siva was once used on a copper paisa weighing 98½ grains for circulation in the province of Benares only.—*Prin. Ind. Ant. Wilson.* See Hindu.

TRISULI GADDI. Tel. Andropogon trispicatus, *Schult.*, syn. of A. tristachys, *Roxb.* The name signifies "trident grass."

TRITANU. See Surya.

TRITHU. Hind. Euonymus fimbriata.

TRITICUM, a genus of plants belonging to the Gramineæ, several species of which are extensively grown in S. E. Asia, and furnish the wheat seed or grain largely used for food, since the most ancient times. It is grown largely as a winter crop in Coimbatore, Salem, Mysore, Berar, Sindh, Oudh, Rajputanah and in the Panjab plains, T. æstivum being the common species, and T. durum the more frequent about Loodiana and Multan, of many varieties, white or red, generally bearded, but beardless wheat is common in some parts.

The starch is often separated from the gluten and used for various purposes in domestic economy. Twelve samples of red and sixty-two of white wheat were exhibited at the Lahore Exhibition. Red wheat holds a very much lower place in the estimation of the Panjab natives, and sells at a cheaper rate than white, the former being consumed by the poorer classes and the bulk of the population, whilst the use of the latter is restricted to men of wealth. Several varieties of white wheat are also grown. The Gilgit or paighambri, a small round fancy grain, is also called "Mullane" or "Rai Munir," from the places where it was first grown: there are also daud khan, ghoni, kabr and vadanak (kanag dagar, Shahpur), the last named being a particularly fine large grain.

Some kinds are grown to great heights in the Himalayas, wheat being one of the chief crops up to 9500 feet on the Chenab, and, according to Dr. Cleghorn, occurring to 15,000 feet on the Sutlej, good to 11,500 feet, and grown to 13,000 feet in Ladak. At Umballa, wheat and also barley are sometimes sown as early as August and September, so as to be in flower in December, but in this plan it is frequently killed by frost. It derives its name, according to Varro, from "tritum," ground or rubbed, because the fruit in its preparation as a food for man undergoes the process of grinding or trituration. The various kinds of wheat have been known from a very early period, and mention is made of wheat as a food in the earliest records of the history of man. Both the Egyptians and Jews made use of wheat as an article of diet, and this food is early mentioned in the Bible. It was also used by the Greeks and Romans, and Theophrastus and Pliny make frequent mention of it. When the fruit is ground, the testa, or seed-coat, is separated from what is called the flour. This flour consists of the powdered albumen and embryo of the seeds. The proximate vegetable principles which this flour contains are starch and gluten. The starch is a highly carbonized vegetable principle, whilst the gluten is characterised by possessing nitrogen. Foods that contain carbonaceous matters are fattening, whilst those that contain nitrogen are strengthening. It is thus that wheat-flour has come to be the staple article of diet of the finest races of men in the world. The other cereal grasses contain the same principles, but the gluten or azotised principle is not in so large a quantity as in wheat, as the following analysis of 100 parts of the organic matter of wheat, rice, and barley will show :

	Starch.	Gluten.
Wheat... ...	70 00	23·00
Rice... ...	85 07	3 60
Barley ...	79·00	16·00

The chemical composition of wheat greatly varies, however, according to the soil in which it is grown. In 100 parts, the following was found to be the composition of eight samples.

	Baroach.	Guzerat.		Bombay Bazar.			Madras.	Calcutta.
Moisturo ..	12·40	10 88	13·28	13 41	13·32	12·56	10·80	11·78
Nitrogenous matter ..	14·68	13·20	13·19	12·84	14·90	14·26	12·98	12·73
Starchy matter..	69·78	73 23	70·87	70·99	6584	70·26	73·51	72·58
Fatty or oily matter	1·16	1·29	1·20	1·17	1·14	1·06	1·03	1·01
Mineral constituents	1·98	1·30	1·25	1·59	2·10	1·86	1·68	1·90

Kum'h,	Egypt.	God'humulu,	Tel.

This is found in the Sutlej valley between Rampur and Sungnam at an elevation of 13,000 feet, highest limit 15,000 feet. Both bearded and awnless varieties occur ; kunuk denotes the flour, not the grain. Rice is not observed above 6,000 feet.

This variety is cultivated in many parts of British India. Two sorts are grown in Mysore, called Hot-te Godhi and Jeve Godhi, the latter being covered with husks like paddy. Jeve Godhi is only grown in the lands bordering on the Pennar, and the gardens in the Bangalore Division. The Hot-te Godhi is largely cultivated in dry lands in the Chittledroog Division, and the vicinity of Hurrihur. This is the wheat usually employed for making loaf bread. It is exported to the Neilgherries.—*M. E. J. R. Cleghorn Punjab Report, p.* 65. *Ainslie.*

TRITICUM DURUM. Desf.

True-bearded wheat, Eng.

Is grown in Switzerland, Italy, Sicily, Spain, and in the Punjab, and it is frequent about Loodiana, Multan, &c.—*Edgeworth.*

TRITICUM HYBERNUM. Linn.

Lammas wheat.	Winter wheat.

Is grown in the Punjab and in the N. W. Himalaya.

TRITON'S BAY or Warangari, a bay in New Guinea.

TRITRAN or "Three Corners" of the people of Sindh, is the same as that called Katar by the Persians and Affghans. The latter people are very fond of it, especially the lower orders in the country villages.—*Burton's Sindh, p.* 294.

TRITON, a genus of shells belonging to the family Muricidæ. The genus has 100 recent and 45 fossil species.

TRIUMANNA. See Hindu.

TRIUMFETTA, a genus of plants belonging to the natural order Tiliaceæ, Tr. angulata, annua, lobata, rotundifolia and trilocularis.—*W. Ic. p.* 320. *Voigt.*

TRIUMFETTA LOBATA. McClelland.

Phetwun,	Burm.	Bet-won,	Burm.

This fibrous plant is annual and grows to a height of five or six feet. It presents a small yellow flower in December, consisting of five petals, and in February presents a small round capsule covered with stiff bristles.—*McClelland.*

TRIVANDRUM, in L. 8° 29·1′ N. and L. 76° 55·7′ E., a town in Malabar, near the sea shore, and the chief town of the principality of Travancore. Its observatory is 195 feet, and the mean height of the town 135 feet above the sea. It is built at the outlet of the Karamani river. It contains a population of 51,718.

TRIVENI. Sans. Three plaited locks, in hindu mythology, the mystical union of the three sacred rivers, the Ganges, Jumna and Saraswati, severally the consorts, or energies, of the three great powers, Siva, Vishnu, and Brahma. Triveni, or the three plaited locks, is a mythological junction ; a female triad, similar to that of the Trimurti of male powers. The Gunga or Ganges, Yamuna or Jumna, join near Allahabad, and the Saraswati is also supposed to join the other two underground. A person dying near the imagined confluence of the three streams, or even those of the Gunga and Yamuna, attains immediate beatitude, consequently self or self-permitted immolation, suttees, &c., are meritorious on this peculiarly holy spot. The junction of the three waters at Allahabad is a sacred prayag, and an annual mela is held in March for purposes of ablution.—*Tr. of Hind. vol.* i. *p.* 15. *Cole. Myth. Hind. page* 398. See Krishna.

TRIVENI, a very old place, spoken of by both Pliny and Ptolemy. It is a school of great repute for indigenous Sanscrit. The great pundit Juggernauth Turkopunchanum, who was Sanscrit tutor to Sir William Jones, and who compiled the digests of Hindoo laws under the patronage of Lord Cornwallis, was a native of this village.—*Tr. of Hind. vol.* i. *p.* 16.

TRIVIATPUTRAM. TAM. Bauhinia tomentosa, *Linn.*

TRI VIKRAMA, a name of Vishnu. It means he who took the three steps, and alludes to the sun's rising, culminating, and setting. See Avataram. Vamana.

TRIWAKKA. HIND. Rumex vesicarius.

TRO. HIND. Hordeum hexastichum, also Triticum æstivum.

TROCHALUS, a genus of insects, one of the Coleoptera of Hong Kong.

TROCHUS, a genus of molluscous animals of the family Turbinidæ. There are known 150 recent and 360 fossil species of Trochus. See Mollusca, Turbinidæ.

TROGLODYTES, of Herodotus, were a diminutive, small sized, race of men dwelling in Ethiopia, and their food is described as that of lizards, serpents, and other reptiles, their language like the screaming of bats.—*Melp. p.* 341. *Tod's Travels, p.* 84, 85.

TROGLOTYDES NEPALENSIS. HODGS.

Tr. subhimalayanus, *Hcd.*

Nepaul Wren. ENG. | Marchok-pho. *Lepch.*

This wren is found in Nepaul, Sikkim, and the N.W. Himalayas. Its colour is darker than that of the European wren.

TROGLODYTES PUNCTATUS. BLYTH.

Spotted wren, ENG. | Marchok-pho, *Lepch.*

Occurs at Darjeeling, and is of the size of that of Europe.

TROGONIDÆ, a family of birds which includes the following Indian species of Harpactes.

H. fasciatus, *Gm.* Malabar Trogon.
H. Hodgsoni, *Gould*, Red-headed Trogon.
H. oreskios of Burmah.
H. kasumba, Malacca, Sumatra.

Dahya,	HIND.	Barranki,	,,
Kurrera,	MAHR.	Bari venka,	,,

This tree is very plentiful in Ganjam and Gumsur, attaining a height of 30 feet, and a circumference of 2 feet from the ground to the nearest branch being 6 feet. It is more common in Guzerat than in the other parts of the Bombay country, and the wood is there reckoned of good quality for small purposes, for it will seldom square above 4 inches. It is said to be used in Ganjam for bandy wheels. Its scabrous leaves are used to polish horn and ivory, &c. The bark is used medicinally, the leaves and sap are used for wounds and for a disease of the eye termed jokia in Orissa, said to be peculiar to children. The berries are greedily eaten by birds.—*Dr. Gibson. Captain Macdonald. Royle Ill. Him. Bot Voigt. Ell. Fl. Andh.*

TROPIC BIRDS ; of these there are the Phaeton æthereus, *Linn.*, the white tropic bird, and P. phænicurus, *Linn.*, the roseate or red-tailed tropic bird. The former has chaste and delicate satiny plumage. They are called by sailors the boatswain or straw tails, from the two bright red projecting tail feathers, which they name the marline spike, and are used as ornaments in the Society Islands. The Spaniards call them Rabijunco, or rush-tails. They are interesting to sailors, because met with far from land, to which seamen believe they nightly return to roost. The red tailed species is met with in the Bay of Bengal, the Indian ocean, and throughout all the Indian Australian tropics. The white tropic bird also occurs in the Bay of Bengal and tropical seas, and is said to breed in the Mauritius on trees.—*Michelet on Birds. Jerdon's Birds.*

TROPIDOPHIS. See Hydridæ, Reptiles.

TROPIDORHYNCHUS TIMORENSIS. A bird of Timor.

TROR. HIND. Polygonum polystachyum.

TROSUM. HIND. A tree of Jubbulpore with good timber, but the tree does not occur in any quantity.—*Cal. Cat. Ex.* 1862.

TROTAK. HIND. Equisetum debile.

TROTU. HIND. Dæmia extensa.

TROUBADOUR. The Scandinavian bards, the Provencal Troubadour, the Neustrienne Trouveur, and Minnesinger of Germany, have all something in common with the Rajpoot Bardai.—*Tod.*

TROWSER CHECK of various kinds is manufactured in the district of Cuddalore and in the outskirts of Madras.

TRUAL. HIND. Impatiens, *sp.*

TRUBU. The roe of the Alausa troli, a fish of which the salted and dried roes form a very considerable article of trade in the western parts of the Malayan Archipelago. It seems to be local, and like salmon and some other fish, to frequent rivers for the purpose of spawning. Its favourite resort is the muddy eastern coast of Sumatra, and more especially the narrow strait which divides Bancalis and some other low islands from the main land, and into which the river of Siak disembogues. At a place called Bukit-batu (rock-hill), a considerable fishery of the trubu is carried on. The river of Bukit-batu is a very small stream, close to the mouth of which stands the town of Bukit-batu, which is a place of considerable trade, the grand staple being roes of the trobo-fish, or telur-trobo (trubu, roe, or egg,) as they are called. There, three or four hundred boats, with two and three men in each, often go out at a time to the fishery, which is outside the straits of the Tanjung-Jati" or Teak tree promontory. The fishery of the trubu is of immemorial antiquity, and is referred to by De Barros as existing on the arrival of the Portuguese just as it does at present. The rivers (of Sumatra), says he, contain a great variety of fish, and in some of them, such as that of Siaca (Siak), they catch small shads (saves), of which the people of the country use the roe only, and of these they have a greater abundance than we have of the fish themselves.—*Decade* 3, *Book* 5, *chap.* 1. *Crawfurd Dictionary*, *page* 440. *Anderson's Mission*, *p.* 335. See Fisheries.

TRUE ANCHOVY. Eng. Engraulis encrasicolus.

TRUE CARDAMOM. Eng. Elettaria cardamomum, *Wh. and Mat.*

TRUE COTTON. Eng. Gossypium arboreum, *Linn.*

TRUE EUPHORBIA. Euphorbia antiquorum.

TRUFFLES, the Tuber cibarium, *Sieb.*, are found in the Punjab Himalaya towards Kashmir, and above Kangra. Skinner says a fungus like the truffle occurs in the route he took towards Europe.—*Dr. J.L. Stewart*, *Punjab Plants*, *p.* 268. *Skinner's Overland Journey*, *Vol. II. p.* 71.

TRUKUDAKA DYNASTY. See Inscriptions.

TRUMBA, also Kala Trumba. Hind. Fagopyrum esculentum.

TRUMBAL. Hind. Ficus cunia.

TRUMMEL. Punjabi. Ficus macrophylla.

TRUMPET FLOWER. Bignonia, *species*.

TRUMPET HONEYSUCKLE. Caprifolium sempervirens.

TRUMPET-SHELL. The chank.

TRUMPET WEED, of the Cape, Lamminaria buccinalis, measures 12 to 14 ft. long.

TRUTSA. Hind. Cousinia, *sp.*

TRYPHON. See Greeks of Asia.

TRYPOXYLUM, a genus of insects with habits similar to Pelopæus.

TSA-BA-LEN. Burm. Andropogon schænanthus, *Linn.*

TSABRI. Hind. Fagopyrum esculentum.

TSAGYEN HILLS, of Burmah, yield marble.

TSA-LAYS. Burm. a measure of capacity equivalent to an English pint.—*Simmonds.*

TSALE, or Tschalleh. Tibetan. Borax. Mentog, Tib. "Borax flowers" is fine borax from Puga and Changthang, which needs no further refining.

TSALLA-GHADDA. Tel. Asparagus adscendens, *Roxb.*

TSAL-TSALA, the Tsal-tsala or Abyssinian spear-fly, is mentioned in Is. vii. 18, Deut. xxvii. 42, Job. xli. 7. It is the Tsee-tsee fly of Livingstone, the winged Tsal-tsal or spear-fly of Isaiah. See Tse-Tse.

TSAL-WEE. Burm. A chain of nobility. This is a badge of nobility among the Burmese, and it is supposed to be derived from the brahminical thread.—*Yule.*

TSAMBELAY. Burm. Lagerstræmia parviflora, *Wall.*

TSAM-IHU-FULIN. Chin. Azadirachta indica.

TSA-MON-H'PYU ? Burm. Anethum graveolens, *Linn.*

TSA-MOUN-TSA-BAH. Burm. Aniseed.

TSA-MUOT. Burm. Anethum graveolens, *Linn.*

TSA MYEIK. Burm. Anethum sowa, *Roxb.*

TSAM-PAY-NA-GO. See Ruby Mines.

TSANG-PO. A river on the N. E. of India, supposed to be the *Dihong*; its waters are divided from those of the Ganges by the Bara Lacha range of mountains. This river, called in Tibet the Tsan-pu, is there also supposed to be the Dihong.

TSAN-PE-NA-GO, a noble range of hills eastward from the town of Malé, in Burmah, which rise in bold and craggy peaks, and attain an elevation of probably some 6,000 feet. This range is also named Shwe-oo-doung, and is sixteen miles to the westward of the ruby mines. Snow lies on them for five months in the year.—*Yule*, *p.* 181.

TSAN-SAY-PYU ? Burm. A tree of Moulmein; the wood is used for ordinary house building purposes. The leaf is eaten boiled as greens.—*Cal. Cat. Ex.* 1862.

TSA-PATT. Hind. Ephedra Gerardiana.

TSAPU. Hind. Alnus, *sp.*

TSAR. Hind. Oreoseris lanuginosa.

TSARBIS. Hind. Plectranthus rugosus.

TSARMA, also Tsarmang. Hind. Hippophae rhamnoides, also Lycium ruthenicum.

TSARRI. Hind. Cicer soongaricum.

TSAR-WOT. Burm. A measure of capacity equal to an English gallon.—*Simmonds.*

TSATIN. Hind. Leptopus cordifolius.

TSAT-THA. Burm. A tree of Moulmein; the wood is used for building purposes.—*Cal. Cat. Ex.* 1862.

TSA-THA-KHWA. Burm. Coccinea indica, *W. & A.*

TSAT-LIE, or Tseh-li, a silk obtained in Nankin and the northern parts of the Chinese empire, superior to the Canton kinds.—*Simmonds' Dict.*

TSAVILA, a weight of 20 grains.—*Simmonds.*

TSAY-THAM-BY-AH. Burm. Gardenia lucida, *Roxb.*

TSCHASII. Rus. Clock.

TSCHEMA-PUNGEE MARA. Mal. Cochlospermum gossypium, *DC.*

TSCHENGENE. Turk. Gypsy.

TSCHEREPIZA. Rus. Tiles.

TSCHERNILO. Rus. Ink.

TSE, also Tsa pat. Hind. Ephedra Gerardiana.

TSEDZE. Hind. Panicum miliaceum.

TSEEN, another name for the mas or mace, a Chinese weight and measure, which contains from 100 to 140 copper cash.—*Simmonds' Dict.*

TSEERI-KURA, properly Sira kura. Tel. Amarantus oleraceus.

TSEET. A timber of Amherst, employed for house posts and in boat building. It is said to be saul wood of small calibre.—*Cal. Ex.* 1851.

TSE-FOU-YOUEN-KOUEI. A Chinese encyclopædia published under the dynasty of Song, in the year 1005.—*Huc's Christianity, vol.* I. *p.* 78

TSEIT, a Burmese measure of capacity, equal to 2 gallons.—*Simmonds' Dict.*

TSE-KI. Chin. Porcelain.

TSEKKA-DOUN. A timber of Amherst, said to be of a fruit tree; the wood is used for house posts, rafters and boat-building; it is like teak, but much disposed to split.—*Cal. Ex.* 1851.

TSELKACHE. Hind. Coccinea indica.

TSENG BYIOU. In Tavoy a compact greyish-brown wood, suitable for common carpentry.—*Mr. Blundell.*

TSENGOO. See Fish.

TSER. Hind. Pinus excelsa.

TSERD-KHAR. Hind. White thorn, in Tibet called in books starbu: Tserd-Khar is also the synonyme of Hippophae salicifolia, Buckthorn, and H. rhamnoides.

TSERKUJI. Hind. Prunus Armeniaca.

TSE-TSE, a fly of Africa, the Glossina morsitans of the naturalist. It is not much larger than the common house fly, and is nearly of the same brown colour as the honey bee, with three or four yellow bars across the after part of the body. Its alertness enables it to evade dexterously attempts to catch it by the hand. Its proboscis is a slender glossy style. Its peculiar buzz is well known to the ox, the cow, the horse, and dog, for with them its bite is death; but man, game, and all wild animals, even sucking calves, the mule, ass and goat, are all exempt. Its object seems to be to replete itself with blood. In the ox, a few days after the bite, the eye and nose begin to run, the coat stares, a swelling appears under the jaw, and perhaps another at the navel, emaciation followed by flaccid muscles ends in death. The Tsal-tsalya or Zimb of Abyssinia seems identical with the Tse-tse fly. It abounds on the banks of the Zambesi river of Africa.—*David Livingstone, M. D., Travels in S. Africa. London,* 1861. See Tsal-Tsala.

TSETSEN KHAN. See Kalkas.

TSETTI MANDARUM. Maleal. Poinciana pulcherrima, *Linn.*

TSE-VANG RAHDAN. See Kalkas.

TSHA. Burm. A bast from Sterculia urens. See Kotheela.

TSHAMPA, a population lying between the mouth of the Mekhong and the frontier of Cochin China.—*Latham.*

TSHAN-TSHAY. In Amherst, a useful wood, but liable to attacks of insects and to split.—*Cat. Ex.* 1851.

TSHAUP-YO. A timber of Amherst, used for house posts and musket stocks. It is a heavy white wood, exceedingly strong, but liable to attacks of insects.—*Cal. Ex,* 1851.

TSHEIK KHYEE. Sapindus, *sp.*

TSHELLIK —— ? Strychnos tieute.

TSHEN, the third recorded Chinese dynasty, began B.C. 1050, lasted 269 years. The emperor Yeu-Yang began to reign B. C. 781. His 6th year was B.C. 776. Confucius lived under his dynasty, and he recorded the observations of the solar eclipses from B.C. 481 upwards to 720.

TSHEN BYOO-MYA-YEN. See Ava.

TSHERI VELLOO. Tel. Chayroot.

TSHIET-KHYEEN. A timber of Amherst, used for house posts; a superior kind of crooked grained sal.—*Cal. Ex.* 1851.

TSHIL ANKAILU. Tel. ? Nerium tinctorium.

TSHO, also Tso and Cho. Tibet. A lake, hence Tsho-Maphan, Manasarovara-lake, Gya-Tsho, the great lake, the ocean. See Tso.

TSHO-KAR. Tib. See Ladak.

TSHO-MORIRI. Tib. or Mountain Lake,

in Rukcha, Ladak, is a fine sheet of water, 16 miles long and two to three broad. See Ladak.

TSHO-RUL, or Bitter Lake in Ladak, is about five miles to the north of Pankong ; its waters are very bitter. It is about 16 miles long and two broad.

TSHUDE. See India.

TSHWAI-LWAI. A timber of Amherst used for musket stocks and sword sheaths ; it is a hard, red, crooked grained wood, fit for cabinet work.—*Cal. Cat. Ex.* 1851.

TSIAGRI NUREN. MALEAL. syn. of Dioscorea tryphylla, *Linn.*

TSIAMPA. See Marco Polo.

TSIA-PUNGUM. MALEAL. Cæsalpinia sappan, *Linn.*, also Michelia Rheedii, *Wight.*

T'SIELA. MALEAL. Ficus t'siela, *Roxb.*

TSIEN. CHINESE. A coin called *Dehos* by the Tartars, and *Sapeck* by the Europeans, is the only currency of the empire. Gold and silver are never coined ; they circulate in ingots of different weights. Gold-dust and leaf-gold are also in use for commercial purposes.—*Huc's Recollections of a Journey*, p. 63.

TSIEN TANG. A river of China; the Bore or Eagre of this river is famous in Chinese history. According to a Chinese proverb, it is one of the three wonders of the world, the other two being the demons at Tang-chan and the thunder at Lung-chan. As in other countries, the bore appears generally on the second or third day after the full or change of the moon, or at what are called spring tides, and particularly in spring and autumn, about the time the sun is crossing the line. Should it so happen that strong easterly gales blow at these times, the Eagre rolls along in all its grandeur and carries everything before it. Dr. Macgowan gave an account of it at Hang-chow-foo. Mr. Fortune from a terrace in front of the Triwave temple saw on a sudden all traffic in the thronged mart suspended ; porters cleared the front street of every description of merchandise, boatmen ceased lading and unlading their vessels, and put out into the middle of the stream, so that a few minutes sufficed to give a deserted appearance to the busiest part of one of the busiest cities in Asia : the centre of the river teemed with craft from small boats to large barges, including the gay flower-boats. Loud shouting from the fleet announced the appearance of the flood, which seemed like a glistening white cable stretched athwart the river at its mouth as far down as the eye could reach. Its noise, compared by Chinese poets to that of thunder, speedily drowned that of the boatmen, and as it advanced at the rate of 25 miles an hour, it assumed the appearance of an alabaster wall, or rather of a cataract four or five miles across, and about thirty feet high, moving bodily onward. Soon it reached the advanced guard of the immense assemblage of vessels awaiting its approach, all intently occupied in keeping their prows towards the wave, which threatened to submerge everything afloat: but their boats all vaulted, as it were, to the summit with perfect safety, and when the Eagre had passed about half-way among the craft, on one side they were quietly reposing on the surface of the unruffled stream, while those on the nether portion were pitching and heaving in tumultuous confusion on the flood ; others were scaling with the agility of salmon the formidable cascade. This grand and exciting scene was but of a moment's duration. The wave passed up the river in an instant, but from this point with gradually diminishing force, size and velocity, until it ceased to be perceptible, which Chinese accounts represent to be eighty miles distant from the city. A slight flood continued after the passage of the wave, but it soon began to ebb. The Chinese say that the rise and fall of the tide is sometimes forty feet at Hang-chow. The maximum rise and fall at spring tides is probably at the mouth of the river, or upper part of the bay.—*Fortune.*

TSIERU KUGANELI. MALEAL. Phyllanthus urinaria.

TSILLA, properly Chilla ghenzalu. TEL. Strychnos potatorum.

TSIN, 4th dynasty, began B.C. 255, and lasted to 207, 49 years. About B. C. 221, the prince of Tsin, one of the vassal states into which the till then feudally governed China had been divided, made himself sovereign of the empire under the title of Che-hwang, also written Che-hoang-ti. He was a great conqueror, and was successful in opposing the inroads of the northern barbarians, the Heung-noo or Huns, one of his measures to withstand whom was the erection of the celebrated Great Wall. Prior to the first emperor Chi-hoang of the T'sin dynasty, about 200 years before the Christian era, the country had been sub-divided into numerous principalities and commonwealths, but that warrior emperor brought them all under subjection, and it is supposed to be from his time that the country was called China, from Tsin or Chin, the name of his dynasty. It was this emperor also who built the Great Wall to keep off the incursions of the Tartars. It was done by forced labor ; every third labouring man was compelled to work for his bare food as a remuneration. It extends from the sea to the most westerly province of Shin-see, about 1,500 miles. It was built of earth faced with brick, it crosses mountains, valleys and rivers, and was finished in five years. Its breadth admits of six horsemen riding abreast, and it has a tower every hundred yards. It was Chi-hoang-ti who introduced yellow as the colour of the royal family's clothes. The Chin dynasty was overthrown by Linpang, of the Han province, who was the first of the Han dynasty. With the destruction of the Tsin dynasty, great injury resulted to the Chinese annals.

TSI-NGUH-MYO. See Ruby Mines.

TSINNA AVAGUDA VERU. Tel. Trichosanthes incisa.

TSINNA DULAGENDI VERU. Tel. Tragia cannabina.

TSINNA MUTA-POLAGUM. Tel. Pavonia Zeylanica, *Cor.*

TSIN-THA-MA-NWAY. Burm. Cocculus cordifolius, *DC.*

TSIOMPA. See Pulo Ceicer de terre.

TSIPPOR. Heb. A bird.

TSIRI KURA. Tel. Amarantus campestris.

TSIRU PANNA. Maleal. Calophyllum spurium, *Choisy,* also C. calaba, *Linn.*

TSJA. Jap. Tea.

TSJAHALA. Maleal. Ficus venosa.

TSJAKA MARAM. Maleal. Artocarpus integrifolius.

TSJANA KUA. Maleal. Costus speciosus.

TSJANA SPECIOSA. Gmel. Costus speciosus, *Roxb. Sm.*

TSJANGELAM PARENDA. Maleal. Vitis quadrangularis.

TSJAPANGAM. Maleal. Cæsalpinia sappan.

TSJELA. Maleal. Ficus tsiela.

TSJEM CUMULU. Maleal. Æginetia indica, *Willde.*

TSJENDANA. Maleal. Sandal wood.

TSJERIM COTTAM. Maleal. Antidesma pubescens.

TSJEROU. Uria. Melochia corchorifolia.

TSJEROUKATA. Mal. Webera tetrandra.

TSJEROU-PONNA. Maleal. Calophyllum calaba.

TSJEROU-THEKA. Maleal. Clerodendron serratum.

TSJERU UREN. Maleal. Riedleia corchorifolia.

TSJERU CANSJAVA. Maleal. Cannabis sativa.

TSJERU JONGANAM PULLA. Maleal. Mollugo spergula.

TSJERU PARUA. Maleal. Sida acuta.

TSJERU TSJUREL. Maleal. Calamus rotang.

TSJERU VALLEL. Maleal. Hydrolea Zeylanica.

TSJETTI MANDARUM. Maleal. Poinciana pulcherrima.

TSJETTI-PULLI. Maleal. Eleusine coracana.

TSJO, also Tsjo karao. Japanese. Boehmeria nivea, China grass.

TSJORATTI. Mal. Gomphia angustifolia.

TSJOVANNA-ARELI. Maleal. Nerium odorum.

T'SLA GADDALU. Tel. Asparagus racemosus, *Willde.*

TSO. Hind. Echinops nivea.

TSO Tibetan. A lake. See Tsho.

TSOAY-DAN. In Amherst and Tavoy a heavy, hard, tough wood, not subject to insects, and being tough and short, it is suited for wheels, musket-stocks, &c.—*Cal. Cat. Ex.* 1851. *Mr. Blundell.*

TSOD-KYI-LENA. Hind. properly Ktso-kyi-lena. Tibetan. Antelope wool.

TSODMA. Hind. Urtica hyperborea.

TSO-GAM, a salt lake in Eastern Ladak Tibet, in L. 33° 70′ N. and L. 78° 34′ E., and 14,580 feet above the sea. See Tsho.

TSO KOOEE. See Kush.

TSO-KUL, or salt lake in L. 33° 33′ N. and L. 78° 44′ E. in Pankong (referred to Pangur), S. of the salt lake Tsomognalari, and 14,400 feet above the sea.—*Cumming.*

TSO MITBAL a salt lake, in L. 33° 25′ N. and L. 78° 40′ E. in Pankong, S. of the salt lake Tsomognalari. It is 14,167 feet above the sea.—*Schl. Herm.*

TSO-MO-GNA-LA-RI, a salt lake in L. 33° 39·8′ N. and L. 78° 38. 5′ E. in Pankong, near Takung. It is 14,010 feet above the sea. The Tsomognalari lake is divided into two parts by a river delta, analogous to the lakes of Brienz and Thun in Switzerland. The two are about equal in surface; but according to native information, they differ in height at about 40 feet; the upper lake, which contains nearly fresh water, almost drinkable, being therefore 14,050 feet.—*Schl.*

TSOMORIRI, a salt lake in L. 32° 45′ 4″ N. and L. 78° 16′ 6″ E. (referred to Náma Bíngbo, on its southern border), in Spiti. It is elevated 15,130 feet above the sea.—*Schl. Hern.* See Cho-Moriri, Tsho-Moriri.

TSOLING, in 1812, were 57—viz., of the Kharchin nomades 7, Orat 3, Sumit and Isuth 1, Mau-mingan 4, Kalkas 3, Bargow 15, Old Eluth 18, and 6 of the new or Eluths reclaimed since 1754, all distinguished as belonging to the Chahar country. There is at Chahar also a large quasi-military establishment for the care of the oxen and sheep of the pasture.

TSOUK-YOA. Burm. Dalbergia alata.

TSU. Chin. Vinegar.

TSUI. Hind. Euphorbia Royleana, Tsui-Kabuli. Cactus Indicus.

TSUK. Hind. Cousinia, *sp.*; Hippophae rhamnoides.

TSULLA-GHEDALU. Tel. Asparagus sarmentosus. See Muslie.

TSUNG. Tibetan. Allium cepa.

TSUNG-JIN-FU. Chin. The imperial clan court, charged with the registration, payment, and jurisdiction of the imperial family.

TSUNG LING. Chinese. literally Onion mountain, the Karokoram or Kouen Lung mountains; which, as high as 17,000 feet, are covered with wild leeks.—*Cunningham.*

TSUNG-MIN. See Yang-tze-Keang.

TSUNG-TU. See Kwang-tung-chi.

TSUNT. Hind. Pyrus malus. Ban tsuntu. Cydonia vulgaris.

TSUNU. Hind. Amygdalus persica.

TSURA PALAM. Tam. Zizyphus napeca.

TSWOT-BA-LWOT. A timber of Amherst; this is said to be from a fruit tree, the wood resembles the Jarool or Lagerstræmia.—*Cal. Ex.* 1851.

TU. See Japan.

TUAC. Timor. Moluc. See Tuba.

TUAC——? Crotalaria juncea.

TUALIKE. Tel. Schmiedelia serrata, *DC.* Its ripe berries are eaten, and the astringent root is employed to check diarrhœa.

TUAR. Beng. Hind. Cajanus Indicus.

TUATUKA. Mahr. Bignonia chelonoides, *Linn.*

TUBA, of Mindoro, or Tuac of Timor and the Moluccas, the sap of a palm, converted by distillation or fermentation into spirit or vinegar.

TUBA, a root? of Singapore used for stupifying and catching fish. Possibly the seed of the Cocculus Indicus.

TUBA-BIDJI. Maleal. Cocculus Indicus.

TUBBAS, a province on the boundary of Herat, adjoining Kayn, and further to the west. It is subject to Persia, and is inhabited by shiahs; its principal places are Tublus, Toon, and Goonabad; of them, Toon is the largest.—*Papers East India, Cabul and Affghanistan, p.* 135.

TUBBUL. Ar. A drum, of peace or war.

TUB-CAMPHOR. See Camphor.

TUBEEH, act of praising God.

TUBEEH ROOKOOKEE. See Rookoo.

TUBER CIBERIUM. The common truffle, grows in Kashmir and Ladak. See Truffle.

TUBIKI Tel. Diospyros embryopteris.

TUBQATEEA, or Mudareea, an order of fakirs or devotees. See Fakir.

TUBUALI. See Tin.

TUBU. Malay. Sugar-cane.

TUBUNNA. Beng. Celtis Orientalis, *Linn.*

TUBUQ. Hind. a tray. Maywa-ka-tabaq, or fruit-tray, p'hool-ka-tabaq, flower or fairy-tray.

TUBUR I ALLUM, a mahomedan saint in whose name they perform ooroos.

TUBUT MAKOOS, the chapter of the Koran read backwards. See Soora-i-tubut.

TUCKA, a weight in Bombay, equal to 0·2182 grains, used for pearls.—*Simmonds.*

TUCKI, also Tuckir. Hind. Asarabacca; Asarum Europœum, *Linn.*

TUDFLA. See Karund.

TUDOR MUL. See Fasli.

TUDOS. See Kelat, p. 488.

TUDUNG, also Chapeyan. Malay. Hats.

TUDUVELLE KIRE. Tam. Solanum trilobatum.

TUFAN. Arab. Typhoon.

TUFA-US-SHAITAN. Ar. Atropa acuminata, *Royle*, also A. mandragora, *Linn.*

TU-FEH. Chin. professional robbers, now merged into the word Tae-ping.

TUFFAH. Arab. Apple.

TUFFAH-ARMINA. Ar. Armeniaca vulgaris, *Lam*, the peach.

TUFFAH-UL-ARZ. Ar. Anthemis nobilis, *Linn.*

TUFSEER. Ar. A commentary.

TUGAR, also Tiraimun and Upaoon. Tabernæmontana coronaria. The sweet-scented wood and root are considered and used as a stimulant; but chiefly used in scents.—*Gen. Med. Top. p.* 152.

TUGGUR. Hind. Asarabacca, Asarum Europœum, *Linn.*

TUGU-HSEN-PAN. Burm. Gardenia florida, *Linn.*

TUGURA. Beng. Hind. Tabernæmontana coronaria.

TUILES. Fr. Tiles.

TUIL-KIRE. Tam. Achyranthes polygonoides.

TUILLU—? The thorny tree called Jaya or yellow myrobalan, with small green fruit.

TUIN. Hind. Viburnum fœtens.

TUI TUI. Aus. Aleurites triloba, *Forst.*

TUIRJA. the Turanian race; See Turan.

TUJ. Beng. Sans. Cassia lignea. Cinnamon. Tuj-ka-tel. Hind. Cassia oil, Cinnamon oil.

TUK——? Hydnocarpus.

TUKAN GEDONG. See Karang Bolla

TUKARIANI. Tam. Cassia tora.

TUKBEER. Arab. The mahomedan creed.

TUKEEA. Hind. A pillow, a faqeer's stand or residence.

TUKHARISTAN. A province of Balkh, lying east of the city of that name, and west of the Jihun. The chief town is Talikan.

TUKHM. Hind. Pers. any seed, as —— balangu, Lallemantea Royleana.

—— dhalyan, Rhus *sp.*, seeds
—— khatmi, Althea rosea, seeds.
—— gandab, a seed from Delhi, considered astringent.
—— khiyarain, HIND. Cucumis sativus.
——i-kutan, PERS. Linseed.
—— sipidan, PERS. Sinapis Chinensis.
—— khurma. Phœnix dactylifera, kernel.
——i-balsan. Balsamodendron Gileadense.
——i-gawah-zimij. Seeds of Berberis lycium, asiatica or aristata.
——i-kanaucha. Salvia Moorcroftiana.
——i-kasus. Hyoscyamus nigra, also Polanesia viscosa.
——i-turb. Raphanus sativus.
——i-wasma. Indigofera tinctoria, seeds.
——i-zard alu. Prunus Armeniaca, stones.
—— malanga. HIND. Lallemantia Royleana, also Salvia pumila.
—— tumma. HIND. Cucumis colocynthis.

TUKHTA. GUZ. HIND. Planks.

TUKHT-I-RAWAN. A travelling throne in which dancing girls and musicians are carried on men's shoulders in front of a bridal procession.

TUKHT-I-SULIMAN. In Kashmir are two eminences which bear this name; one near Kashmir is called Sir-i-Shu, or Siva's head, by the hindus, and also Sankara char: and the hill on the opposite side of the city is called Huri Purbat, or the hill of Vishnu or Hari. On the latter hill is the fort of Kashmir. All accounts agree that the heat on the plains under the Sulimani range is excessive. The Kayser mountain seems a collection of inaccessible precipices—*Vigne.* See Kaysar. Khyber.

TUKHT-I-TAOS, the famous Peacock throne of the emperors of Delhi. It was so called from its having the figures of two peacocks, with their tails spread. They were so naturally executed in sapphires, rubies, emeralds, pearls, and other precious stones of appropriate colours, as to represent life and strike every beholder with the most dazzling splendour. The throne itself was six feet long by four feet broad; it stood on six massive feet, which, with the body, were of solid gold inlaid with rubies, emeralds and diamonds. It was surmounted by a canopy of gold supported by twelve pillars, all richly emblazoned with costly gems, and a fringe of pearls ornamented the borders of the canopy. —*Tr. of Hind. vol.* ii. *p.* 297.

TUKI, also Tuka. TEL. Diospyros ebenaster.

TUKKUL, a system of temporary clearing. See Kumari.

TUKLA. HIND. Rottleria tinctoria.

TUKHM-I-KARPAS. Seed of a plant from Delhi, astringent, and stimulating, given in flatulent indigestion, two rupees a seer.—*Gen. Med. Top. p.* 159.

TUKSEER. AR. Tafsir? the science of numbers.

TUKUA—? Cotton manufactures.

TUKU PERU of New Zealand. Balæna antartica.

TUL. HIND. Morus parvifolia.

TULA. BENG. Gossypium Indicum, *Lam*, also G. herbaceum, *Lam.*

TULAH. PERS. The name of a flower or herb called also Nan-e-Kelagh.

TULAK. AR. A divorce. Tulaq-i-byn, the husband's once saying to his wife, "I have divorced you." Tulaq-e-rujaee, the above repeated twice. Tulaq-e-mootuluqqa, ditto thrice.

TULAK-BARA. MALAY. Ballast.

TULAM, or Tola, a weight of 3 drs. apothecaries'.—*Simmonds' Dict.*

TULANCH. HIND. Rubus lasiocarpus.

TULASI. Ocymum sanctum, regarded as sacred and made into a rosary by the vaishnava hindoos. It is regarded as a type of Vishnu, and every vaishnava household has a plant in its parterre, which is encircled daily in the morning and worshipped.

TULASI VER. TAM. root of Ocymum sanctum, also Ocymum villosum?

TULDA BANS. BENG. Bambusa tulda, Dendrocalamus tulda, *Pers.*

TULDONEE. A river of Boondee.

TULENNI PHUL. HIND. Hamiltonia suaveolens.

TULIDUN. HIND. Solanum nigrum.

TULIKUKAR. Gardenia tetrasperma. See Karkun-i-Hazara.

TULIPA STELLATA.

Lallee waroon	HIND	Nulkia,	HIND.
Myhoula,	,,	Peperi	PANJAB.

This tulip is abundant in the Kangra valley and the Kumaon hills, whence its bulbs, which are edible, are exported. Also found in the Sutlej valley between Rampur and Sungnam, at an elevation of 4,000 to 6,000 feet.—*Cleghorn Punjab Report, p.* 68.

TULIP TREE. Thespesia populnea.

TULK HIND. Mica.

TUM. A weight in Mysore of 32 lbs.; 2 irase.

TULKA PYRE. TAM. Phaseolus.

TULKLU. HIND. Morus alba, M. serrata.

TULL. See Thull; Tor.

TULLUBDAH. See Kol.

TULUKUL. HIND. Morus serrata.

TULOUR, or Salibaboo Islands, lying between Mindanao and Celebes, are three in number, of considerable size and moderately elevated. Kabrouang is the name of the most southerly, and has a peaked mountain on it. Its southern end is in lat. 3° 47′ N. and long. 127° 11′ E. Tolour or Karbalang is the larger and more northerly island, and lies from lat. 4° to 4° 28½′ N.

TULSI. Hind. is the synonym of three species of Ocymum., viz., O. sanctum, Tulsi proper, O. album, the safed or white tulsi, and O. basilicum, the kala or black tulsi.

TULSIA. Hind. Amaranthus anardana.

TULSI BAI. See Holkar, Mahratta Governments.

TULSI-KE-MUNKE. Duk. Beads of Ocymum sanctum. Tulsi-ki-jar, the root.

TULSU MUDRIGA. Beng. Leea macrophylla, *Roxb.*

TULU, also Tuluva, a language spoken on the S. western point of the peninsula of India by a small remnant of people. See Dravidian. India.

TULUKAN AMMA. See Hindu.

TULWAR. Hind. A sword.

TUMAL. Hind. Diospyros tomentosa, *Roxb.*

TUMAKU. Tobacco.

TUMAN, in the Mongol language, signifies ten thousand. It was borrowed by the Persians and Arabs, and with them means a weight or sum of money, originally equal to ten thousand mithkals or Arab drachms of silver. In the year 1871, a tuman of Ispahan was equal to five rupees of British India.—*Yule Cathay, p.* 117.

TUMATTI. Tam. Bryonia callosa.

TUMB or Tomb, Great and Little, two small islands in about lat. 26° 15′ N., on the north side of the Persian Gulf.

TUMBA. Hind. Lagenaria vulgaris.

TUMBA KODIWALI. Mal. also Tumba Kodiveli. Plumbago Zeylanica, *Linn.*

TUMBAKU. Guz. Hind. Pers. Tobacco.

TUMBALI. Tam. Tumal. Beng. Diospyros tomentosa, D. melanoxylon, *Roxb.*

TUMBALOO, or Lota, a small metal pot.

TUMBATIN. Tel. Canavalia gladiata.

TUMBE CODIVELI. Hort. Mal. Plumbago rosea.

TUMBI. Hind. Lagenaria vulgaris. In the valley of the Beas, Cucumis colocynthis, *Linn.*

TUMBI. Hind. Rosa macrophylla.

TUMBIKA. Tam. Embryopteris glutinifera, *Roxb.*, also Diospyros ebenaster and D. embryopteris.

TUMBI KARRA. Tel. Diospyros ebenaster,

TUMBI-KI BAJI. Duk. Tumbi kire. Tam. Tumbi-kura. Tel. Phlomis Indica.

TUMBI MARAM. Tam. Diospyros melanoxylon. Ebony.

TUMBI PALLAM. Tam. Fruit of Chirongia sapida, also of Diospyros melanoxylon.

TUMBOLI. Diospyros melanoxylon.

TUMBOORA. Hind. A drum.

TUMBURU. Hind. A celestial musician.

TUMI CHAVA KARRA. Tel. Diospyros ebenaster.

TUMIDA. Tel. Diospyros melanoxylon, *Roxb.*

TUMIEN. The silk petticoat of the Talaing women; it is of bright hues.

TUMIKA. Hind. Beng. Diospyros glutinosa. Embryopteris glutinifera, *Roxb.*

TUMIKA CHAVA. Tel. Diospyros ebenaster, *Konig.* D. embryopteris, *Pers.*

TUMMA. Hind. Viburnum cotinifolium.

TUMMA. Pers. Cucumis colocynthis, *L.*

TUMMA CHETTU. Tel. Acacia Arabica.

TUMMEDA CHETTU. Tel. Diospyros melanoxylon, *Roxb.*

TUMMEDA MAMIDI. Tel. Semecarpus anacardium, *Linn.*

TUMMI. Tel. Leucas cephalotes, *Spreng.* the Phlomis cephalotes of *Roxburgh*, is the most celebrated species. The leaves are eaten, the flowers are sacred to Siva, and are offered in his temple. But there are many species to which the term Tummi is indiscriminately applied.

TUMMICA. Tel. Diospyros melanoxylon, *Roxb.*

TUMONGONG. Amongst the Malays, a high officer of state, to whom the superintendence of internal police matters is entrusted. A hereditary elective officer of Johore.—*Journ. Ind. Arch. No. IX. vol. V. p.* 568.

TUMR. Egypt. ? Turmeric.

TUMR-I-HINDEE. Pers. Tamarind.

TUMTUM. Arab. Rhus coriaria. Sumach.

TUMA Sans. From tumus, darkness.

TUMULUS. Tumuli are met with in Wales, Scotland, Ireland, France, Sweden, Russia, Tartary and Africa. Those in Ireland and in the plain of Troy are precisely similar to those of the United States. In America they are scattered in profusion from Lake Erie to the Gulf of Mexico, and are found in Texas, New Mexico, and S. America; other antiquities also are found in the valley of the Mississippi. Tumuli are not numerous in Ohio, but often found in Kentucky, and more commonly in Tennessee and Mississippi. One of the largest is at Cahokia in Illinois, being a parallelogram 235 yards long by 170 broad and 90 feet high. Cairns and tumuli are found on the peaks of the Neilgherries. They contain agricultural implements; and iron spear heads, bells, and sepulchral urns, with figures of coiled snakes, tigers, elephants, dogs and birds, sickles and gold rings, have been found buried under the piles of stones. It is supposed that the Kurumbar race formerly interred in cairns. See Cairns. Barrow. Tope.

TUMUTTI. Tam. Bryonia callosa. The oil of its seed is the Tumutti-kai Yennai.

TUN, also Tuna, also Gul-tun. Hind. Cedrela toona.

TUNAKAYIKO. See Inscriptions.

TUNANA MADANA. Hind. Rhamnus purpureus.

TUNANI ZANANI. Hind. Viburnum fœtens.

TUN-BI. Burm. Timber.

TUNDHE. Hind. Rhamnus purpureus, also Viburnum fœtens.

TUNDI KOIR. Tam. Fibre of Calotropis gigantea.

TUNDU. Can. Cedrela toona.

TUNEANG. A group of eight islands on the south coast of China, which derive their name from Tuneang, the largest and the most northerly of the group, and which is five miles in circumference.

TUNG. Hind. Rhus cotinus, and R. parvifolia, also Picea Webbiana and P. pindrow; also Taxus baccata.

TUNG. Beng. Rottleria tinctoria, *Roxb.*

TUNG. Chin. Copper.

TUNG. A long-measure of Sumatra, corresponding to the English foot.—*Simmonds.*

TUNG-CHI. See Kwang-tung-chi.

TUNGA. See India.

TUNGA MUSTE, also Must-akamu, Tel. Cyperus hexastychus, *Rottl.* C. rotundus, *R.* i. 197. The tuberous root is used in making perfumes.

TUNGANI, a race of military settlers who came originally with military conquerors from the west of Asia, and settled down in the country of Yarkand.—*Cayley.*

TUNGE. See Kunawer.

TUNG-EU——? Dryandra cordata.

TUNG-GULI. Jav. Cathartocarpus fistula.

TUNG-HSEN-PAN. Burm. Gardenia floribunda?

TUNGLA. Hind. Rhus parviflora.

TUNG MRU. See Mru.

TUNG OIL TREE of China, yields a valuable oil. It is expressed from the seeds of Eleæococca oleifera, and is much used by carpenters for boats, furniture, &c.—*Simmonds' Dict. Fortune's Residence amongst the Chinese.*

TUNG-PAN. See Kwang-tung-chi.

TUNG-QUIN GULF. See Tonking.

TUNGRANG PASS in L. 31° 37′ N. and L. 78° 27 E. in Kanawur, leading from the Todung to the Sutlej valley, 13,739 ft.—*Ger.*

TUNG-SI. Chinese. Fishing tackle made of snake's gut.

TUNG-TSAU. Chin. Aralia papyrifera.

TUNGU. Hind. Pistacia integerrima.

TUNGUDDA. Tel. Cyperus juncifolius.

TUNG-THU, dwell between the Setang and the Salwin, and in Amherst Province, and are in their dialect more closely connected with the Yuma languages than with the Burman. The Tungthu has a large glossarial agreement with Karen, but it has special affinities with the Kumi and other Yumi dialects, and particularly with the Khy-eng. The Tungthu are Islamized Chinese and are said to resemble the Anamese, but as their dress resembles that of the Anamese, this may create deception. They occupy a portion of province Amherst, and are the only people there who understand the plough. This has a metal blade. They are esteemed good cultivators.

TUNGUS, a general name applied to a population common to a vast area in Siberia and China. Their physiognomy connects it with the tribes of Northern Asia in general, and their language forms a transition between the monosyllabic and agglutinate forms of speech. The Tungus, under the name Mantchu, constitute the dominant population of China itself. These tribes under Chinese rule, in Mantchuria, on the water-shed of the Amur or Sagalin, are termed Mantchu. The Mantchu proper have a literature with an alphabet modified from the Mongol. They are agricultural and industrial. Chevalier Bunsen observes (Report Brit. Ass. 1847) that the researches of our days have made it more than probable that the Tartar, Mantchu and Tungus belong to one great stock; that the Turkoman, Chud, Fin, Lap and Magyar (Hungarian), present another stock closely united, and that both these families were originally connected with each other. He proposed to call this whole group of languages the Turanian, and in lieu of Indo-Germanic or Indo-European he proposed the term Iranian, following the antithesis of Iran and Turan, established by Heeren and Carl Ritter. He further remarks that "these nations, who probably may be reduced to two families, one centering in the Altai and the pasture lands towards the Himalaya, and the other having its centre in the Ural mountains, have acted in the history of civilisation a most powerful episode by conquest and destruction. They appeared in the fifth century as the Huns, a scourge to Romans and Germans; they produced Jengiz Khan, Timurlung and Mahomed II.; they destroyed the Persian empire, subdued Hindustan, and they still sit upon the throne of Byzantium and upon that of China. They seem destined to partake only by conquest in the higher civilisation of the surrounding nations, older or younger ones, the Chinese presenting the one extreme, the Iranians the other. Little disposed to learn from them as neighbours or subjects, they become more or less civilised by being their masters. They cannot resist the inward force of the civilisation of their subjects, although they repel it as an outward power. The Tungus are the native population of the Amur, but even if we include emigrant Chinese and Mantchu, they are far from numerous. They may be estimated at 24,000 for the whole of the territory at present in possession of Russia. With two exceptions, the tribes of the Amur belong to the Tunguzian stock. The language of the Gilyak, on the lower Amur, differs from the Tunguzian dialects along the river, but the features of these Gilyak are still Mongol, they have small obliquely set eyes, prominent cheek bones, and scanty beards. With the Aino on Sakhalin, the language differs both from the Tunguzian and Gilyak; their features are decidedly not Mongol, and they are distinguished by a great profusion of hair. The close affinity between the various Tunguzian dialects, and the differences existing between Tunguzian, Gilyak and Aino, will be observed in the following short vocabulary.

	Tunguzians.					Gilyak.	Aino.
	Yeniseisk.	Nerchinsk.	Manyarg.	Manchu.	Orochi.

The Tunguzian tribes either are nomades, keeping herds of reindeer or horses, or they subsist chiefly upon the produce of their fisheries. The reindeer Tunguzians are called Oronchon or Oroke, a word signifying reindeer-keepers, and are met with on the Upper Amur, and on Sakhalin. Among the other tribes, a tradition prevails of their having owned reindeer at some remote period; and there is one tribe along the sea coast still called Orochi, or Orochon. The Manyarg and the kindred Birar, and Solon, on the Nonni, who occupy the vast prairies above the Bureya mountains, keep large herds of horses. The Goldi, Olcha (Mangun), Gilyak, Orochi of the sea-coast, and Aino, are fishermen, but are hunters also; and the Goldi, especially those settled on the Sungari, cultivate the ground to some extent. It is, however, only the Mantchu and Chinese, and the Daurian living amongst them on the Middle Amur, who till the ground to a larger extent, the Daurian doing so even at the time the Russians first appeared on the Amur. At that period their settlements extended into Dauria, whilst at the present day they are but rarely found above the Dzeya. The Oronchon of the Upper Amur numbered, in 1856, two hundred and six individuals of both sexes, roving over an area of 28,000 square miles, which would give one hundred and seventy square miles to each individual. Next come the Manyarg; their numbers, including the Birar and the Solon, on the right bank of the Amur, are about 20,000, of whom one-sixth at most are under Russian sway. The agricultural population about Aigun, estimated at from 40,000 to 50,000, is also confined chiefly to the right bank of the river, those on its left bank hardly amounting to 2,000. The Goldi occupy one hundred and fourteen so-called villages on the Amur, with three hundred and twenty houses, and 2,560 inhabitants; the Mangun forty villages, with one hundred and ten houses, and 1,100 inhabitants. The Kile on the Upper Gorin, and Negidalze on the Amgun, do not probably exceed 1000 souls. The population along the Usuri is estimated by Veniukof at 1,400 of whom about four hundred are on the left bank of the river. The vast tract extending between the Usuri and the sea-coast, from Castries Bay in the north to the frontier of Korea, is very thinly populated, and it is only in the south, where there are several Chinese settlements, that the population is comparatively numerous. Veniukof reckons the population between the Usuri and the coast, north of Port Imperial, at 1,600; and that 2,500 might be the approximate population of the entire coast-region under consideration. The Gilyak on the Amur occupy thirty-nine villages, having one hundred and forty houses, and 1,680 inmates. The population of Southern Sakhalin, up to about 49° of north latitude, was calculated by Mamia Rinso at 2,850, in four hundred and thirty-eight huts, which would allow 2·1 square miles to each inhabitant, if we assume a similar population for the northern (Russian) part of the island. Or, arranging this population according to tribes, we obtain a total of 23,500.

Oronchon of the Upper Amur.... ...	260
Manyarg and Birar. ...	3,000
Daurian, etc.	2,000
Goldi on the Amur and Usuri. ...	3,560
Olcha (Mangun) on the Amur. ...	1,100
Negidal and Kile (Sanager). ...	1,000
Orochi of the sea-coast.	1,000

Gilyak on Lower Amur and Sakhalin.	8,180
Aino on Northern Sakhalin.... ...	1,000
Chinese on the Usuri, etc.	1,400

The banks of the Upper Amur, down to the mouth of the Dzeya, are in the occupation of the Tunguzian tribes of the Oronchon and Manyarg (Monagir, Manegre), the principal difference between whom is, that the chief domestic animal of the former is the reindeer (Oronchon, reindeer-keeper), and of the latter the horse. The horses are small, but strong and of great endurance. Before going on a long journey the Manyarg keeps his horse for a day without food, and on his return also the poor beast is made to undergo five or six days' abstinence. This is done with a view of keeping the horse in working condition.

The Oronchon originally lived in the province of Yakutsk, whence they voluntarily emigrated to the banks of the Amur in 1825, and occupied there part of the territory of the Manyarg, whom they compelled to withdraw further down the river. There are two tribes of Oronchon. One of them, the Ninagai, occupies the left bank of the Amur, between the rivers Oldoi and Amazar, and the country up to and beyond the crest of the Stanovoi mountains. In 1856 it mustered sixty-eight males and sixty-six females, and twenty-seven of the former paid annually five shillings and five pence of tribute each, or in lieu thereof twelve squirrel skins, to the officer commanding the post of Gorbitza. The other tribe, the Shologon, occupy the right bank of the Amur, down to the Albazikha rivulet. They number seventy-two individuals of both sexes, including forty males, of whom seventeen had to pay to the commandant of Ust Strelka a tribute of six shillings and four pence each. They owned eighty-two reindeer. The Manyarg, as stated above, occupy the Amur below the Oronchon, but in spring and summer they ascend it for the sake of fishing, to the Ignashina and Sester, leaving their horses below the Albazikha. They also dwell in the valley of the Dzeya, and generally speaking, the whole of the prairie region down to the Bureya mountains, where their horses find forage; whilst the Oronchon, on account of their rein-deer, are confined to the mountainous districts. The Birar residing along the Bureya river are a sub-tribe of the Manyarg, and the Solon, north of Mergen, are probably related. The Manyarg and Oronchon are rather small and of spare build. Their arms and legs are thin, a feature most striking in their half-naked children, whose bellies moreover are very protruding. The face is flat, but the nose, in many instances, large and pointed. The cheeks are broad, the mouth is large, and the lips are thin; the eyes very small and sleepy-looking, and generally of black or reddish-brown. The hair is black and smooth, the beard short, and the eye-brows very thin. The Manchu features frequently found among the Manyarg are traced by Maack to the officials who annually collect the tribute, and to whom their women are freely yielded up. These Tunguzians lead a wandering life. During spring and the beginning of summer they generally reside on the banks of the river, engaged in fishing, but in the autumn and winter they retire to the interior of the country to pursue the chase. In these migrations the rein-deer or horse carries the scanty property of its owner. The only other domestic animal is the dog. The Solon is a nomadic tribe, allied to, if not identical with, the Manyarg, and occupy the country north of Mergen. They claim to be descendants of the ancient Sushi, by whom was founded the dynasty of the Gin. The word Solon signifies "Shooters." They are indeed expert huntsmen, and even their women mount on horseback and pursue the game. Besides horses, they have dogs for hunting, also sheep, oxen, and camels. The Daurian dwelling on the Upper Sungari, in the neighbourhood of Tsitsikar, are well made, especially the women, and dress like the Manchu in China. The secretaries of the Mandarins who are sent to this part, are privileged by a letter from the Khan to select any women or young girls whom they may fancy. Some of the men whose wives had been taken in this manner, still persist in considering it a special favour to have such fine gentlemen as brothers-in-law. Others, though discontented, are compelled to conceal their chagrin from fear of punishment and disgrace.

The Tunguzians of the Lower Amur are the Goldi, Mangun, and Orochi tribes, and exhibit a great similarity in outward appearance, customs and manner of life.

The Tunguzian tribes are the Goldi and Mangun, along the Amur, Sungari and Usuri; and the Orochi along the sea coast from Castries Bay to about 44° N. lat. The Goldi inhabit both banks of the Sungari below the town of Sansin, the Usuri below the Dobikhu and the Amur to the village of Niunguya below the Gorin. Maack calls the Goldi living along the Amur down to Nyungya " Kileng ; " and those about the mouth of the Usuri, " Hodseng." Below the Goldi the banks of the Amur are occupied by the Mangun or Olcha as far as the village of Kadema, below the Russian settlement of Irkutskoi. These Tunguzians have the usual Mongol features, prominent cheek bones, and small oblique eyes. The nose is not in all cases flat. The eyebrows are more defined and arched. The mouth large, the lips thick and of a dull red colour. The complexion is fair and ruddy. The colour of the hair and eyes is black, but occasionally grey eyes are seen. The size of head is large compared to that of the body.

The Gilyak inhabit the banks of the Lower Amur, below Pul, and the northern portion of Sakhalin, their limits on the island being on the west coast in the village of Pilyavo. 50° 10′ N. lat ; and on the east coast 50° 30′ N. lat. There are several tribes of these Gilyak, those of the mainland, the Smerenkur of the west coast of Sakhalin, and the Tro of the east coast, but the distinction between them is trifling. Nor do they differ much in outward appearance from their Tunguzian neighbours. The features are still Mongol, the nose is rather flat, the eyes are small, the lips are voluptuous, the eyebrows bushy, and the beard is stronger than with the Tunguzian. They do not shave the head, but wear the hair tied up into a thick tail or in tresses. The Russians describe their women as frights, but tastes are not always the same, and Rimso, the Japanese, says they are very comely, and doubly attractive on account of their daily ablutions. Their dress does not vary much from that of the Tunguzians. They wear large boots of seal-skin or sometimes cotton, and a blouse of Chinese pattern. The use of fish-skins is much more restricted. If we may credit the statement of Rimso, polyandry prevails among the Smerenkur Gilyak, and the women are treated with the greatest indulgence. Only those however skilled in the use of the needle can expect to get married.—*Klaproth, Asia Polyglotta. Maack, Travels on the Amur. Tronson (Barracouta Bay). Furet, Letter sur l'Archipel. Japonais (Joncquiere Bay). La Perouse. Pfizmaier's Vocabularium der Lino Sprache, Vienna,* 1851, quoted in *Ravenstein's Russians on the Amur, pp.* 338 *to* 391. *Latham.*

TUNGUS. Hind. Tam. Marsdenia tenacissima, also fibre of Calotropis gigantea ; also Catgut.

TUNI. Hind. Cedrela toona, C. serrata.

TUNI. Tam. Calico, a cloth, clothing.

TUNIA. See Kutch. Jet.

TUNICATA, the Tunicaries, Class vi. of the Mollusca, viz.

TUNKANNA. Sans, Borax.

TUNKAR. Pers. Borax.

TUNKI. Hind. a very thin chapatti, or flour scone, or cake ; or large wafer made with butter.

TUNKRA. a pass in Sikkim, in Lat. 27° 38′ N., Lon. 88° 56′ E. Its crest is 16 100 feet above the sea. The ascent on north-west side, gradually, is over a snow-bed and glacier ; descent on north-east steep but grassy.

TUN MARAM. Tam. Cedrela toona. See Cedar. Deodar. Furniture. Toon.

TUNMATRU. Sans. From tut, that, and matra, only.

TUNNA. Beng. Cedrela toona.

TUNNI. Pshtu. Taxus bacata. Common yew.

TUNNUHU. See Khutri.

TUNNUS. Mahr. Dalbergia oojeinensis, *Roxb.*

TUNQUIN. The Tunquinese, both men and women, are for the most part well proportioned, of an olive complexion, very much admiring the whiteness of the Europeans. Their noses and faces are not so flat as those of the Chinese, as being generally better made. Their hair is very black, which they usually wear as long as it will grow, being very careful in combing it. The common people plait it in tresses, and tie it like a great roll upon the top of their heads. But the nobility, men of law, and soldiers, tie their locks about their necks, that they may not flutter in their faces. They blacken their teeth and suffer their nails to grow ; the longest being accounted the fairest.—*Everard's Treatises, p.* 17.

TUNTRA. Sans. From tantra, religious austerities.

TUN-TUNI-NUTI. Beng. Amarantus fasciatus, *Roxb.*

TUNYEEN, or Tunyeen dha, Burm. A wood scarce near the Moulmein and Sitang rivers, more abundant near Tavoy and Mergui, of maximum girth 5 cubits and maximum length 30 or 40 feet. When seasoned it floats in water. It is used for the construction of the very large boats which go from Moulmein to Tonghoo ; hence in much demand at Moulmein, but not so much so on the sea coast. The wood when cut has a peculiar and fragrant smell, is tough and oily, and likely to make excellent planes, handles, &c. &c.—*Captain Dance.*

TUOOZ, having recourse to God against evil.

TUP. Sans. A cap, a hat. See Mugut.

TUPAIA, insect eaters, closely resemble squirrels, are almost confined to the Malay islands, as also are Ptilocerus Lowii of Borneo, and Gymnurus Rafflesii.

Tupaia Elliotti, *Blyth.* The Madras tree shrew, occurs in the hills west of Madras, length 14 inches, of which the tail is 7½.

Tupaia ferruginea, *Blyth.* of Arracan and the Malay peninsula, is insectivorous and frugivorous. It dwells in rudely constructed lairs in the highest branches of trees ; it is very agile, and makes enormous bounds.

Tupaia Javanica occurs in Java.

Tupaia murina occurs in Borneo.

Tupaia Peguana, the Sikkim tree shrew, occurs in Sikkim.

Tupaia tana occurs in Sumatra.—*Jerdon p.* 66. *Wallace, p.* 141.

TUPHA, a college. See Inscriptions.

TUPHA. Turk, a horse tail, the tails of the horse and of the yak, used as standards amongst the Turkoman. The Tupha, Tugha or Tau, according to Remusat, is the Turkish name of the horse-tail standard, but is applied also by the Chinese to the Yak-tail, which, respectively, with those nations, mark the supreme military command.—*Rech. sur les langues Tartares,* 303 ; *also D'Ohsson,* i. 40 *in Yule Cathay,* i. *p.* clxxiv.

TUPI. Guz. Hat.

TUPONG. Malay. Flour.

TUPOZ, in Manilla, the intermediate layers of the stem of the wild plantain, Musa textilis, of which are made web cloths and gauzes four yards long, of different degrees of fineness.—*Simmonds' Dict.*

TUPPA. This musical measure belongs to the very extremity of India, being indigenous as far as the Indus and the countries watered by its tributaries ; and though the peculiar measure is common in Rajasthan, the prefix of Punjabi shows its origin. Colonel Tod says he has listened at Caen to the viola or hurdy-gurdy, till he could have fancied himself in Mewar.—*Tod's Rajasthan, vol.* i. *p.* 648.

TUPPA, amongst the Bhot race, a probationer for the buddhist religion of Tibet. The word Bhot is traced in the names of Bult in Bultistan, But in Butan, Bet in Tibet, or in such words as the Bhooteya or Bhotiya. The race known as the Bhot in ethnology comprises the Little Tibetans, the natives of Ladak, the Tibetans of Tibet Proper, and the closely allied tribes of Butan. The Bhot of Ladak is strong, hardy, short and square, with a decidedly Mongol physiognomy—by which is meant a flat face, broad cheek, depressed nose, very large ears, oblique and narrow eye curtained at the corners, black hair and low stature, their average height being 5 feet 6·1 inches : the skulls are less Mongolian, having a capacity of 72 cubic inches, 80 cubic inches being a fair capacity for a European. The Grand Llama is a Bhot. The ordinary monk or priest in Tibet is the Gylong, above whom are Llamas or presidents, and below whom are the Tohba and Tuppa. The Tuppa is a probationer who is admitted into the establishment to which he would attach himself at the age of 8 or 10, and receives instruction accordingly. At 15, he becomes a Tohba, and at 24 a Gylong, provided his acquirements be satisfactory. There are two sects, the Gyllupka, who dress in yellow, and the Shammar, in red, the Shammar Gylongs being allowed to marry. The Bhots of the Tibetans have been extending westward. As a general rule, the Himalayas divide Hindustan from Bhutland, but there are Bhots in several parts south of the crest of those mighty mountains in Garhwal and Kemaon.

TUPSEE MUTCHI, the mango-fish.

TUPTA-SHURMI. Sans. From tapta, hot, and shurmi, an image of iron.

TUR, also Arhur, also Tur-dhal. Hind. Cajanus Indicus, *Spreng.* See Dhol, Dhal, Tour. Burri toovar.

TURAB-UL HALAK. Arab. Arsenic.

TURAI. Hind. Luffa acutangula, *Roxb.* Ghi-turai, Luffa pentandra, Ram-turai, Abelmoschus esculentus.

TURAI. A great belt of gravel and sand, filling a trough from five to fifteen miles in length, parallel to the base of the Himalayas, to the depth of from 15 to 150 feet. It is so sickly as to be nearly without resident population ; the houses of the cultivators are on the slopes of the hills. It is full of marshes, The belt of saul forest, which is waterless, is next to it towards the mountains, and is almost equally malarious : rivers disappear and pass under it, reappearing in the Turai : it is surrounded by sandstone hills, which skirt the base of the mountains.—*Capt. Herbert in Bl. As. Trans. vols.* xi. xii. See Terai. Therai.

TURAK. In Kashmir, a weight of six seers or 12lbs. English.

TURAKA HARALA. See Hurala.

TURAKA VEPA. TEL. Melia azedirachta.

TURA LODH. HIND. Rondeletia tinctoria.

TURAN, or Tartary, a country bordering on Iran in the north and north-east, which in the remotest times was inhabited by a race who are now spread into different parts of the world, and are known to ethnologists as Scythians, Turanians or Mongolians. Tuirja or Turan are names of which the derivations are still discussed. But Burnouf has called attention to them in reference to the Bactrian satrap of Turina or Turiva mentioned in Strabo. According to Cuvier, the probable cradle of the Mongolian or Japhetic race is the Altai mountains, whence they have spread over northern and central Asia southwards as far as Hindustan north of the Ganges, and eastwardly to the Eastern ocean, where the race is distinctly visible in the Japanese, the Corean people, and those of Siberia. The Arsacidæ were Turanians. In the Zend books the Turanians are styled (Firdusi's Turiya) the foes or antagonists of the Arians. Turvasu means one who possesses the treasures of his enemy, and Turvasa one who conquers when he pleases. The Turanian people, but particularly the Turko-Tartar tribes, have made themselves renowned in antiquity by their warlike disposition and by the wild intractable rudeness of their habits, and have appeared amongst surrounding nations as spoilers, destroyers and plunderers. The Aryan tendency is to form national and political communities, marry one wife, and worship one supreme and spiritual deity. The Turanian tendency is to have little national or political cohesion, to marry one or more wives, without much sentiment : and worship gods and heroes without much idea of a spiritual existence, beyond that implied in the notion of ghosts and demons. Turanian races have a longing for spiritual excitements. Perhaps, as the vividness of religious faith is common amongst mountaineers, the simple pastoral and secluded life common to most of the Turanian tribes may impart a tendency to reverie and visionary absorption. The great horse sacrifice is allowed to have been originally Turanian, whether derived directly from the Sakæ, or indirectly from Persia and Media, where the white horse was an important element in a campaign of Cyrus ; and Mr. Atkinson found traces of this sacrifice still lingering on the southern borders of Siberia. The Turanian family of languages is agglutinative. They are scattered over the whole of the northern part of Europe and Asia, from China to the Pyrenees, and from Cape Comorin across the Caucasus to Lapland. The Hungarian, Lapponian, and Finish dialects are now classed as members of the great Turanian or Tartar family of tongues, which is spoken by all the tribes from the Himalaya to Okotsk and to Lapland, and includes the Hungarian, Crimean and Turkish tongues. Farrar states that the terms Turanian, Nomadic, or Allophyllon of Pritchard, are names applied to all languages not belonging to the Arian or Semitic, and which comprise all languages spoken in Asia or Europe not included under the Arian and Semitic families, with the exception of the Chinese and its dialects. These are Tungus, Mongol, Turki, Samoiede and Finn. The writers on this Class are Rask, Klaproth, Schult, Castren, and Muller. But even Muller admits that the characteristic marks of union, ascertained for this great variety of languages, are as yet very vague and general if compared with the definite ties of relationship which severally unite the Semitic and Arian. The Turanian languages occupy by far the largest portion of the earth, viz, all but India, Arabia, or Asia Minor and Europe ; but except agglutination there is not a single positive principle which can be proved to pervade them all. They have priority of affinity with the languages of Africa and America and even with the Chinese.

The Ugro-Tartarian languages, the languages of High-Asia and other regions, which other writers style Turanian, are those of Dr. Pritchard's second group of nations belonging to the same great family, and include the various hordes who have been known under the names of Tartar, Turk, Mongol, Mantchu and Tungus. All these nations appear, from the result of late researches, to be allied in descent, though long supposed to be quite separate. In the vast wilderness extending from the chain of the Altai to that of the Himalaya are the pasture-lands, where, during immemorial ages, the nomadic tribes of High Asia have fed their flocks and multiplied those hordes which from time to time descended in immense swarms on the fertile regions of Asia and of Europe. Perhaps the earliest of these invasions of the civilized world was that of the Hiong-nu, expelled from the borders of China by the powerful dynasty of the Han. These were the people who, after their inroad on the Gothic empire of Hermanrich, made their way, under Etzel or Attila, into the heart of France. Hordes from the same regions under Togrul-Beg, and Seljuk, and Mahmud of Ghizni, and Jengiz, and Timur and Othman, overwhelmed the kaliphat and the empires of China, of Byzantium, and of Hindustan, and lineal descendants of the shepherds of High Asia still sit on the throne of Cyrus, and on that of the Great Constantine, while the branch which ruled in India under the title known to Europe as the Great Moghul closed in 1862 by the death at Rangoon of the last emperor of Delhi, then a prisoner of the British. As a branch of the Ugro-Tartarian, he speaks of some of the insular nations to the eastward of Asia and near the coast of the Pacific Ocean. The idiom of the islands comprised in the empire of Niphon, as well as that of the independent Liu-kiu Archipelago, bears some signs of affinity to those of the Ugro-Tartarian nations, and he adds that Mr. Norris, who has studied the Japanese, and whose very extensive knowledge of languages renders him a great authority in such questions, had assured him that the principle of vocalic harmony and other phenomena of the Tartar languages prevail in the idiom of the Japanese and Liu-kiu islands. In his group of the Ugro-Tartarian, Pritchard also classes the aboriginal inhabitants of India who, he supposes, were expelled from Hindustan by the brahmins and the Arian people who accompanied them across the Indus, and retired, as it is supposed on apparently insufficient proof, into the Dekhan. They still occupy the greater part of that peninsula, and a portion, at least, of the island of Ceylon. Their idioms—the Tamil, the Telugu and the Karnataka of the Mysore,—are sister dialects of one speech, and he considers it likely that the languages of the mountain tribes of India, the Bhil, the Gond, the Toda and others belong to the same stock. Dr. Pritchard adds that Professor Rask had conjectured that these nations are also of the Tartar stock. Their language has some of the peculiarities of structure which have been pointed out. He also observes that there are some curious analogies between the Tamulian and other dialects of the Dekhan and the languages of Australia, with which we have obtained some acquaintance through the labours of Mr. Threlkeld and several other missionaries, and from the able researches of Captain Gray. Turkish is a Turanian dialect. Its grammar is purely Tataric or Turanian. The Turks, however, possessed a small literature and narrow civilization before they were converted to mahomedanism; and as the language of Mahommed was Arabic, a branch of the Semitic family, closely allied to Hebrew and Syriac, this together with the Koran, and their law and religion, the Turks learned from the Arabs, their conquerors, many of the arts and sciences connected with a more advanced stage of civilisation. Arabic became to the Turks what Latin was to the Germans during the middle ages; and there is hardly a word in the higher intellectual terminology of Arabic, that might not be used, more or less naturally, by a writer in Turkish. But the Arabs, again, at the very outset of their career of conquest and conversion, had been, in science, art, literature, and polite manners, the pupils of the Persians, whom they had conquered; they stood to them in the same relation as the Romans stood to the Greeks. Now, the Persians speak a language which is neither Semitic, like Arabic, nor Turanian, like Turkish; it is a branch of the Indo-European or Aryan family of speech. A large infusion of Persian words thus found its way into Arabic, and through Arabic into Turkish, and the result is that at the present moment the Turkish language, as spoken by the higher ranks at Constantinople, is so entirely overgrown with Persian and Arabic words, that an uneducated Turk from the country understands but little of the so-called Osmanli, though its grammar is exactly the same as the grammar which he uses in his Tataric utterance. The whole of what is called the Turanian family of speech consists of terminational or agglutinative languages, and this Turanian family comprises in reality all languages spoken in Asia and Europe, and not included under the Aryan and Semitic families, with the exception of Chinese and its cognate dialects. The name Turanian is used in opposition to Iranian, and is applied to the nomadic races of Asia as opposed to the agricultural or Aryan races. The Turanian family or class consists of two great divisions, the Northern and the Southern. The Northern is sometimes called the Ural-Altaic or Ugro-Tataric, and it is divided into five sections, the Tungusic, Mongolic, Turkic, Finnic, and Samoyedic.

The Southern, which occupies the south of Asia, is divided into four classes, the Tamulic, or the languages of the Dekhan; the Bhotiya, or the dialects of Tibet and Bhotan; the Taic, or the dialects of Siam; and the Malaic, or the Malay and Polynesian dialects. The most characteristic feature of the Turanian languages is what has been called Agglutination, or "gluing together;" and what distinguishes the Turanian languages is, that in them the conjugation and declension can still be taken to pieces; and although the terminations have by no means always retained their significative power as independent words, they are felt as modificatory syllables. The difference between an Aryan and a Turanian language is somewhat the same as between good and bad Mosaic. The Aryan words seem made of one piece, the Turanian words clearly show the structures and fissures where the small stones are cemented together. Where nomadic tribes approach to a political organisation, their language, though Turanian, may approach to the system of political or traditional languages, such as Sanskrit or Hebrew. This is indeed the case with the most advanced members of the Turanian family, the Hungarian, the Finish, the Tamil, Telugu, &c.

The Tungusic branch extends from China northward to Siberia, and westward to 113°, where the river Tunguska partly marks its frontier. The Tungusic tribes in Siberia are under Russian sway. Other Tungusic tribes belong to the Chinese empire, and are known by the name of Mandshu, a name taken after they had conquered China in 1644, and founded the present imperial dynasty.

The original seats of the people who speak Mongolic dialects lie near the Lake Baikal and in the eastern parts of Siberia, where we find them as early as the ninth century after Christ. They were divided into three classes, the Mongol Proper, the Buraiat, and the Olot, or Kalmuk. Chingis-khan (1227) united them into a nation and founded the Mongolian empire, which included, however, not only Mongolic, but Tungusic and Turkic, commonly called Tataric tribes.

It will thus be seen that the races, known as Turanian, contain those vast tribes which occupy Central and Northern Asia, and include, according to modern ethnology, the Tartar, Finn, Turk and Magyar. The prevailing characteristic of the Turanian race, according to Bunsen, is the propensity to magic or Shamanism. Turanians in the west lose much of the Mongolian type. In British India and on its borders are four distinct branches of this family of languages spoken by members of the Turanian race. In the north are the Himalayan tribes, with their dialects, occupying from the Kunawars on the Sutlej to the Boti of Bhutan in the extreme east. Then there are the Lohitic class of languages, comprising with the Burmese and others of the Malay peninsula the dialects of the Naga tribes and of the Mikir in Assam, and of the Bodo, Kachari, Kuki and Garo in Eastern Bengal. Nearly related to this class is the Kol or Munda family of languages, including the Kol, Sonthâl and Bhumi of Sinh'bhum and Western Bengal and the Mundala of Chota Nagpur, the Kur or Muasi and the Korku in Hushangabad, and westwards in the forests of the Tapti and Nerbudda until they come in contact with the Bhil of the Vind'hya hills, and the Nahal of the Kandesh belong to this family; indeed Mr. Hislop held that the word Kur is identical with Kol.

The fourth branch is Tamulic or Dravidian, to which belong the Brahui of Baluchistan, the Gondi, the Tuluva of Kanada, the K.rnata of the Southern Mahratta country, the Todava of the Neilgherries, the Malayalam of Travancore, the Tamul and the Telugu.

The Kur and the Sonthal are closely related, and are separated from the Dravidian. The Kur or Muasi and the Korku or Kurku, to the north-west and west of the Mahadeva hills, are, in language at least, quite distinct from the Gond tribes. Mr. Hodgson is of opinion that the Tamulian, Tibetan, Indo-Chinese, Tungus, Chinese, Mongol and Turk, are so many branches of the Turanian family; and he regards the aborigines of British India, as Northmen of the Scythic stem, but he remains undecided whether they owe their Scythic physiognomy to the Tungus, the Mongol, or the Turk branch of the Tartars or Scythians, and whether they immigrated from beyond the Himalayas at one period and at one point, or at several periods and at as many points. All writers are of opinion that when the Aryans entered India, they found the country occupied by prior Scythic races, to whom their writers apply such contemptuous expressions as Dasya, M'hlecha, &c. These prior races seem to have been driven largely out of Northern India into and through the Vindhya mountains into the Peninsula of India and Ceylon, where their idiom, the Tamul, Telugu, Malayalam and Karnatica, are sister dialects of one speech; and Dr. Pritchard concurs in opinion with Professor Rask, who regards the languages of the mountain tribes of India, the Bhil, the Gond, the Toda and others, as also of the Tartar stock, and mentions that some curious analogies have been observed between the Tamulian and other dialects of the peninsula and the languages of Australia. Mr. Logan, however, who has had great opportunities of contrasting and comparing the Dravidians from various parts of India, inclines to call them South Indian. He remarks that, physically, the population of Southern India is one of the most variable and mixed which any ethnic province displays. A glance at a considerable number of Kling (Telugu) and Tamular of different castes and occupations, shows that the varieties when compared with those of similar assemblages of men of other races, such as Europeans, Ultra Indians or Indonesians (including negroes in the last two cases), are too great to allow of their being referred to a single race of pure blood. Some are exceedingly Iranian, some are Semetic, others Australian, some remind us of Egyptians, while others again have Malaya, Polynesian and even Simang and Papuan features. This varied character of the races of the south of the peninsula may be seen daily, in Madras, to which all the races from the south of India resort.—*Wh. H.* iv. *Pritchard. Bunsen. Muller. TURBAN.

Pagri,	HIND.	Dustar,	HIND.

The head dress of the mahomedans, possibly from the two Persian words, sir, the head, and band, a tie. A principal site of the manufacture of cotton turbans formerly was the town of Arnee in the Chingleput district, but they are now made at Oopada in the Rajahmundry district, and also in the district of Madras. A principal site of the manufacture of silk turbans was Seringapatam in Mysore. They are of a pink colour, and are sold at from Rupees 10 to 25 Rupees each. An exchange of turbans is the symbol of fraternal adoption.

TURBINELLA, a genus of Gasteropodous molluscs, family Muricidæ, of which 70 recent and 20 fossil species are known. Turbinella rapa, the chank shell, is used in India as a musical trumpet, and is sawn into rings to form bracelets, anklets. It was the war-trumpet of the ancient hindus, and the hindu god Vishnu holds a chank in one of his four hands.—*Tod's Rajasthan, vol.* i. *p.* 372. See Chank. Mollusca.

TURBINIDÆ, the ninth family of Gasteropodous molluscs, as under,

TURCOMANIA. See Iran.

TURDINUS CRISPIFRONS. BLYTH. very like T. macrodactylus (Malacopteron macrodactylum, *Strickland,*) v. Brachypteryx albogularis.

TURDUS, the Thrush. M. Homeyer has discriminated the Missel Thrush, common in the W. Himalaya, from Turdus viscivorus of Europe, and has designated it T. Hodgsoni; it appears to be somewhat larger than the European bird, with more of the aibescent hue on the outer tail-feathers.

Turdus iliacus. The 'Redwing' of Europe, W. Asia and Barbary, has been observed in large flocks in Kohat. It is migratory, breeding in the extreme north.

Turdus fuscatus, Pallas (Naumanni of *Temminck,*) species inhabiting Siberia and Japan, and straying rarely into Europe, has been once obtained in Nepal.

Turdus merula. The 'Blackbird' of Europe, W. Asia, N. Africa, Madeira, Afghanistan ? Kashmir ? China ? Females from Afghanistan and Chusan cannot be distinguished from the common European blackbird ; it is common in the mountains surrounding Kashmir, at from 10,000 to 13,000 feet elevation The Prince of Canino has recently distinguished a nearly affined " Merula dactyloptera" from Syria.

Turdus pilaris. 'The Fieldfare' of Europe and W. Asia, is migratory. One specimen has been killed at Saharunpur. In the Himalaya generally, it is replaced by T. atrogularis, a common bird of N. Asia, which occasionally strays into Europe and has been obtained so far west as in Denmark ; in India it occurs sparingly in Lower Bengal during the cold season.

Turdus (or *Merula*) *simillima*, of the mountainous parts of S. India, and M. Kinnisii of those of Ceylon, though nearly affined, are sufficiently well distinguished from the Blackbird of Europe. In the Himalaya generally, the latter is replaced by M. boulboul (pœciloptera of *Vigors*), which is not unfrequently brought in cages to Calcutta, where it is known as the 'Kastura.'

Turdus viscivorus, the 'Missel Thrush' of Europe, W. Asia : its representative in the W. Himalaya, T. Hodgsoni, appears to be constantly a little larger and has more of the whitish hue upon the outermost tail-feathers ; upon which slight differences, M. Homeyer distinguishes it by the name T. Hodgsoni.—*Cal. Rev. Adams. Jerdon.*

TUREEQUT. Ar. the path (i. e., heaven.)

TUREH-TEZAK. Pers. Garden Cress, Lepidum sativum.

TURSA. Hind. Tamarix Indica.

TURFAN. See Arians.

TURFANI. See Wool.

TURI, Tawuri, T'hori or Tori, dwell in the t'huls of Dawudputru, Beejnote, Noke and Noakote and Oodur ; they own and hire out camels, but like the Bawuri and Khengar are great thieves, and are called " bhoot" or evil spirits and sons of the devil. See Kohat.

TURI. Mah. Tour. Dhal.

TURIA. Hind. Brassica juncea.

TURISHI. Tel. Turishu. Tam. Sulphate of copper. Blue stone.

TURI, also Bhoosa. Hind. Chopped straw.

TURIN. See Ken.

TURINA. See Turan.

TURISHKA, a name applied in India to the Turk tribes of High Asia. There are no records extant of the invasion of India in A.D. 881 by the Turki tribes, half a century after Mahmud's expedition from Zabulist'han against Cheetore, in the reign of rawul Khoman. See Turk; Turkana.

TURIVA. See Turan.

TURK. Among the Arabs, this word was as vaguely applied as the word Scythian among the Greeks ; it was indiscriminately applied to the Tartars, the Cheremisse, the Morduin, and other tribes. Turk, applied to an Osmanli, is deemed derogative. The Kirghis, originally a small tribe settled in a remote corner of southern Siberia, on the banks of the Yenisei river, migrated or were removed in the 17th century to the shores of the Balkash and Isikul lakes. In their new abode they amalgamated with the Kasak and Burut, and absorbed a host of smaller tribes, the debris of the old Ghuz, Koman, and Kipchak, and have gone on increasing until their number is now nearly three millions of souls, and constitute almost the exclusive population of the steppe from the Ural river in the west to the Mongolian frontier on the east, and north and south from the Siberian line to the plateau of Pamir. Amongst hindoos, Turk means any mahomedan, and Turkabhahsha, any mahomedan tongue. See Aborigines, India, Iran, Kazzilbash, Sanscrit, Shaman, Tartar, Turishka, Turan.—*Turnerelli's Kazan, vol.* ii. *p.* 200.

TUR-KA-DHAL. Hind. Cajanus Indicus, *Spreng.* See Dhol ; Dhal.

TURKALANKARA. Sans. From tarka, the name of the nyana darshana, and alankara, an ornament.

TURKANA. Amongst the Rajpoots, means tribute. It is derived from the Hindi word Turk or Mahomedan, races who exacted tribute from the Rajpoots. See Turishka.

TURKARI. Hind. a vegetable.

TURKARIAN. Vegetable curries.

TURKHANI, or Turcolani. This tribe came to Sind and were in power from A. H. 962 to A. H. 1021. See Afghan.

TURKISTAN, Elchi, Yarkand, and Kashgar, are the three principal towns in Turkistan. Elchi, in L. 36° 50′ N. and L. 78° 20′ E. 5,500 feet. Yarkand, in L. 38° 10′ N. and L. 74° E. 4,200 feet. Kashgar, in L. 39° 15′ N. and L. 71° 50′ E. 3,500 feet. Elchi is represented to have the coldest, as Kashgar the hottest, temperature of the three towns throughout the year. Snow falls at Kashgar, but never remains longer than a few hours, but it is seen lying in Yarkand for three or four days together. See Jews, Kalmuck, Kirghis, Persian kings, India. Bokhara is an isolated kingdom in Turkistan of small extent surrounded by a desert. It lies between the parallel of 36° and 45° N. and 61° 67′ E. lon. It is an open champagne country of unequal fertility, and intersected by the Oxus on its southern border. Its rivers are the Amur or Oxus, the Sir

or Jaxartes, the Kohik or Zarafshan, and the rivers of Kurshi and Balkh. It is ruled over by an amir, now under Russia whose sway comprised between the 37° and 43° north lat., and between the 60° and 68° of east long. The Uzbek are undoubtedly the preponderating race in Bokhara, not so much from their number, as by the ties which bind them together. They are divided into stems and sections, like the Kirghiz, and have their elders, or beys, who enjoy a certain consideration among them. The Uzbek branches, with some of their subdivisions, are enumerated in the work called "Nassed Mameti Uzbekia."

Eastern Turkestan was subject to China from the beginning of the Christian era to the time of Changiz Khan; and after the middle of the 18th century, the Chinese regained possession of it. Eastern Turkistan is eminently mahomedan, and its rulers had always been mahomedan from the time of Taghalak Timur, who was, we are told, the first mahomedan sovereign of Kashgar of the lineage of Chinghiz. Buddhism indeed was found still prevalent in the cities of Turfan and Kamil at the time of the embassy of Shah Rukh in 1419, and probably did not become extinct much before the end of the century. But, in the western states, mahomedanism seems to have been universal from an earlier date and maintained with fanatical zeal. Saintly teachers and workers of miracles, claiming descent from Mahomed, and known as Khwaja or Hojah, acquired great influence; and the sectaries attached to the chiefs of these divided the people into rival factions, whose mutual hostility eventually led to the subjugation of the whole country. For, late in the seventeenth century Khojah Appak, the leader of one of those parties called the White Mountain, (having been expelled from Kashgar by Ismail Khan, the chief of that state, who was a zealous supporter of the opposite party or Black Mountain) sought the aid of Galdan Khan, sovereign of the Eleuth or Kalmuk race of Dzungaria. Taking the occasion so afforded, that chief, in 1678, invaded the states south of the Thian Shan, carried off the khan of Kashgar and his family, and established the Khojah of the White Mountain over the country in authority subordinate to his own. Great discords for many years succeeded, sometimes one sometimes another being uppermost, but some supremacy always continuing to be exercised by the khans of Dzungaria. In 1757, however, the latter country was conquered by the Chinese, who in the following year making a tool of the White party, which was then in opposition, succeeded in bringing the states of Turkestan also under their rule.

Chinese Tartary, also known as Bocharia, Little Bokharia, and Eastern Turkestan, is a great depressed valley shut in by mountains of great height on three sides, and on the east are barren sands which merge imperceptibly into the great desert of Gobi. The Tian-Shan range separate it from Dzungaria, the Bolor range from Transoxiana, and the Kara Koram and Kuen Lun from India and Tibet on the south. The land is clayey near the front of the mountain base, but sandy in the central tracts. Rain is rare, and the air is of exceeding dryness, but the climate is temperate and healthy. It is well watered from the mountains, the waters converging towards the Ergol or Tarym.

The country has gold, copper, salt, sulphur and the jade stone. The southern line of the caravan route passes through it from Khamil to Aksu and Kashgar. From Aksu to Kokand is 800 miles. Alti-shahr, or the six cities, forms the western district, comprising Yarkand, Kashgar, Khotan, Aksu, Yanghisar and Oosh-Turfan, with territories subordinate to each.

Chinese Turkestan includes the provinces of Yarkand, Kashgar and Khoten; Yarkand is the entrepot of trade between China and Bokhara; Khotan, from the time of Ctesias, has been celebrated for its mineral products, its jade and emeralds, its shawl wool and flax: it was at one time the entrepot of a vast trade with Hindustan, and now imports largely furs, broad cloth, leather, and sugar. The inhabitants of the country call themselves Turk, speak the Turkish language, and profess the mahomedan religion.

The people of Asia, who inhabit the countries which extend northwards to the Russian frontiers, westwards to the Caspian Sea, and southwards to Afghanistan, are for the greater part descendants of Turks, and it would be more proper to give to all these countries, the general name of Turkestan, dividing it into,

1st, Northern or Russian Turkestan, comprehending in it the three hordes of the Kirghis nation; 2ndly, Southern Turkestan, inhabited by the Khivan, Turkoman and Kara-kalpak, and including also Great Bucharia, Kokand, and Tashkend; 3rdly, Eastern Turkestan, comprising Little Bucharia, which is subject to China. The Chinese and Manchoo call by the name of "hoei hoei" all the mahomedan tribes who live under their dominion. This word, therefore, has ceased to designate a nation. As the Ouigour Hoei hoei, called simply Hoei hoei under the Mongol dynasty of Yunan, were mahomedans; this name is applied by the Chinese to all those of the same religion, in the same manner as the Russians are often called Greeks, because they are of the Greek church. The inhabitants of the towns of Little Bucharia are in part descendants of the ancient Ouigour Hoei hoei, and consequently Turks, in part Sarti, or Bucharians, who are scattered as merchants all over central Asia, and who are Persians. There are many of them at Peking, Hangtcheoufou, Canton, and other commercial cities of China. Their mother tongue is Persian, but they also speak the oriental Turki, which is the general language of Turkistan, and the most diffused in Little Bucharia. The Ouigour writing character was the original source of those still used by the Mongol and Manchu, and was itself almost certainly derived from the old Syriac character through the Nestorians. The modern Tartar characters are written (and it is presumed, read) in vertical lines from top to bottom of the page, the lines succeeding each other from left to right. What Ouigour meant with Mongol authors is doubtful, but the people and language so called by the Western Asiatics were Turkish. Captain Valikhanoff speaks of the language now in use at Kashgar as being Uigur, but it is not clear whether he means that this term is known to the natives.—*Russians in Cent. Asia, p.* 67. *Yule Cathay* I. *p.* 206. *Timkowski's Journey to Peking, vol.* I. *pp.* 6, 378-79.

TURKO-TARTAR. The people of Turkestan are from two distinct sources, viz., the settled races, descendants of Semitic and Iranian conquerors from the south, and the races who have been occupying the country from pre-historic times. This latter part of the inhabitants have been styled Turko-Tartars. The people are in their habits the same as they were 2000 years ago. The Turko-Tartaric race stretches from the Polar sea to the Hindu Kush, and from the interior of China to the shores of the Mediterranean. Vambery divides the Turks who, from East to West occupy this extent, into

1. Burut, black or pure Kirghis.
2. Kirghis, properly Kazak.
3. Karakalpak.
4. Turkoman, and
5. Uzbek.

The Burut, pure or black Kirghis, dwell on the eastern boundary of Turkistan, viz. the valley of the Thian Shan chain of mountains, and they inhabit also several points on the shores of the Issik Kol, close upon the frontier chain of mountains. They are powerful, thick set, strong boned figures, but remarkably agile and have acquired much warlike renown. Their face is less flat than the Mongolian and Kalmuk, and less fleshy; their foreheads somewhat higher, and their eyes are less almond-shaped than the Kalmuk: few of them have red or fair hair or a white complexion. The Burut are in contact with Kalmuk and Mongolians, and in consequence their language has many Mongolian words, and now and then they profess themselves more or less mahomedans, but shamanism largely prevails. The Burut is the wildest and most savage and most superstitious of them, but less malicious than the Kirghis and Turkoman. The Burut has not wholly abandoned shamanism, and knows little of mahomedanism.

The Turkoman is the fourth gradation of the Mongolian Turkish race, and in many respects they resemble the Kasak and Kara Kalpak. The pure Turkoman type as met with the Tekke and Chador tribe in the centre of the desert, is of middling stature, small oblong head, not high cheek bones, somewhat snub noses; longish [illegible] feet turned in, with the bright, sparkling, fiery eyes, of the desert races, but more particularly the Turkoman. The blonde colour is common, indeed the Kelte race amongst the Gorgen Yomut are generally half blonde. The Goklen and other tribes near Persia evidence an intermixture with the Iranian Persian. The Turkoman is slender and agile, and they are hardy and enduring under privations. They early separated themselves from other Turko-Tartarian nations moving from Mangishlak in the east to the northwest and thence to the south. In their present country, the Salor and Sarik are the oldest tribes; after them the Yomut, who at one time ranged from north to south along the shores of the Caspian. The Tekke were transferred by Taimur to Akhal. The Ersari, at the close of the 18th century, moved from Mangishlak to the shores of the Oxus, and recently many of the Chadar moved to the other bank of the Oxus. The chief avocation is pillage. The men wear long locks till the close of the first year of their marriage. The women are handsome, and perfect beauties are to be seen, not inferior to the Georgians in growth and regularity of features. The young girls of all nomade tribes are good riders, but Turkoman women excel all the others. Turkoman women, amongst the nomades, wear heavy silver ornaments. They are the labourers of the community, are virtuous, devoted and much respected. Uzbek women go unveiled. Though settled in Central Asia for centuries past, the Uzbek still meditates on robbery and war, and if no foreign enemy be found, they attack each other in bloody inter-

nal strife. The Uzbek is honest, upright has much Turkish open-heartedness, they are proud of their education, and represent all the best side of the national character of the Turks.

The nomade Uzbek and Turkoman of Central Asia are largely engaged in a slave trade, stealing the Persians and selling them in Bokhara. The Uzbeks of Khiva practice it when driven towards Persia by the Turkoman, and of the Turkoman, the Tekke tribe capture the people of Khorassan, Herat, and Seistan, and the Yomut tribe, those along the southern shores of the Caspian, but the Salor, Sarik, Kara Chadar, and Alieli capture sheah Persians from the territory of the Persians.

The name by which Vambery designates these peoples is Turko-Tartar, from amongst whom came the warrior peoples known in the west as the Hun, the Avar, the Utigur, the Kutrigur and Khazar. And the manner of living, the customs and beeical conditions, as then described, of the [illegible]tar tribes whose arms reached from the Jaxartes to the heart of Rome and Gaul, have much resemblance to those of the present inhabitants of Turkestan; and the people of Central Asia, particularly the nomade tribes, are in their social habits the same as they were two thousand years ago. In the tent of many a nomade chief a similar life is observable as that described by Priscus as prevailing at the court of the king of the Huns. Attila, Chengiz Khan and Timur, in historical character, resemble each other, and Vambery is of opinion that energy and good fortune could now almost produce on the banks of the Oxus and Jaxartes one of those warriors whose soldiers like an avalanche carrying everything before it, would increase to hundreds of thousands, and would appear as a new example of God's scourge, if the powerful barriers of Western civilization, which has great influence in the East, did not stop the way.

The Turk, wherever met with, is ever heavy and lethargic in his mind and body, but in his resolves, firm and steadfast, not from principle, but from apathy and aversion to change, and it is from these characteristics that his appearance is earnest and solemn, a profound seriousness, a marble cold expression of countenance, with a great inclination to pomp and magnificence. An Uzbek or Turkoman has a proud bearing as if possessed with a self-consciousness of greatness and power. 224

The Osmanli Turk's love of independence is boundless. He considers himself born to rule, that hunting and war alone are worthy of him, and husbandry is considered ignominious. In Central Asia, agriculture is exclusively in the hands of the Persian slaves—commerce and business with the Tajik Hindu and Jew. The Turk is intellectually the inferior of the Iranian and Semitic nations. This defect is noticed by other nations who apply to them the terms Turkluk, (Turkdom) Kabalik (coarseness), Yugunluk (thickness), and Sadeluk (simpleness), and with these qualities, as the Osmanli is easily taken in by the Armenian, Greek and Arab, the Turk is as easily so by the Tajik and Hindu. In transactions the Turks are regarded as possessing more honesty, frankness and confidence, plainness, simplicity and uprightness. Compared with the Persians, the Turk is a faithful servant, attached soldier and upright man. They are more brave, persevering, and love more to rule than any other Asiatic people. They are unpolished, wild and uncultivated, but seldom cruel out of malice. They crave riches, but only to expend them. They exact much labour from their subordinates, but protect and deal liberally with them. The Turk is innately a nomade, and like other nomades is distinguished for hospitality.

In Balkh and near Andkhui the harvest is at the beginning of June; in the oasis countries in July, in Kung rat and in the north of Khokand not till the beginning of August. Of the rivers, the Oxus is the most important, and the Zarafshan, Shahar Sabz, and Jaxartes follow. See Kirghis. —*Vambery's Sketches of Central Asia, pp.* 283 to 312.

TURKEY, a dominion in the east of Europe, west of Asia, and north of Africa, ruled by a race of Osmanli Turk, descended from Othman, who founded the empire in A. D. 1299. The population in Europe and Asia number 35,350,000, of whom 21 millions are mahomedans, with 14 millions of christians of the Greek and Romish church. The revenue is about 14½ millions of pounds. They consist of Osmanli Turks, Greeks, Armenians, Jews, Slave or Slavonians, Roumain, Albanian, Tartar, Arab, Syrian, Chaldeans, Druse, Kurd, Turcoman and Gypsies. A pastoral band of four hundred Turkish families was journeying westward from the upper streams of the river Euphrates. Their armed force consisted of four hundred and forty-four horsemen, and their leader's name was Ertoghrul, which means "The Right-Hearted Man." As they travelled through Asia Minor, they came in sight of a field of battle, on which two armies of unequal numbers were striving for the mastery. Without knowing who the combatants' were, the Right-Hearted Man took instantly the chivalrous resolution to aid the weaker party; and charging desperately and victoriously with his warriors upon the larger host, he decided the fortune of the day. Such, according to the oriental historian Neschri, is the first recorded exploit of that branch of the Turkish race, which from Ertoghrul's son, Othman, Osman, or Usman, has been called the nation of the Ottoman Turks, and the Osmanli. And in this, their earliest feat of arms, which led to the foundation of their empire, we may trace the same spirit of haughty generosity, that has been their characteristic down to our own times. The little band of Ertoghrul was a fragment of a tribe of Oghuz Turk, which, under Ertoghrul's father, Sulaman Shah, had left their settlements in Khorassan, and sojourned for a time in Armenia. After a few years, they left this country also, and were following the course of the Euphrates towards Syria, when their leader was accidentally drowned in that river. The great part of the tribe then dispersed; but a little remnant of it followed two of Sulaman's sons, Ertoghrul and Dundar, who determined to seek a dwelling-place in Asia Minor, under the Seljukian Turk, Ala-ud-din, the sultan of Iconium. The adversaries, from whose superior force they delivered him, were a host of Mongols, the deadliest enemies of the Turkish race. Ala-ud-din, in gratitude for this eminent service, bestowed on Ertoghrul a principality in Asia Minor, near the frontiers of the Bithynian province of the Byzantine emperors. The rich plains of Saguta along the left bank of the river Sakaria, and the higher district on the slopes of the Ermeni mountains, became now the pasture-grounds of the father of Othman. The town of Saguta, or Saegut, was his also. Here, he and the shepherd-warriors who had marched with him from Khorassan and Armenia, dwelt as denizens of the land. Ertoghrul's force of fighting men was largely recruited by the best and bravest of the old inhabitants, who became his subjects; and, still more advantageously, by numerous volunteers of kindred origin to his own. The Turkish race had been extensively spread through Lower Asia long before the time of Ertoghrul. Quitting their primitive abodes on the upper steppes of the Asiatic continent, tribe after tribe of that martial family of nations had poured down upon the rich lands and tempting wealth of the southern and western regions, when the power of the early khalifs had decayed like that of the Greek emperors. One branch of the Turks, called the Seljukian, from their traditionary patriarch Seljuk Khan, had acquired and consolidated a mighty empire more than two centuries before the name of the Ottomans was heard. The Seljukian Turks were once masters of nearly all Asia Minor, of Syria, of Mesopotamia, Armenia, part of Persia, and Western Turkestan: and their great sultans, Toghrul Beg, Alp Arslan, and Malek Shah, are among the most renowned conquerors that stand forth in oriental and in Byzantine history. But, by the middle of the thirteenth century of the christian era, when Ertoghrul appeared on the battle-field in Asia Minor, the great fabric of Seljukian dominion had been broken up by the assault of the conquering Mongols, aided by internal corruption. The word Turk has the same root as that of Turan, the country of the restless-horse-riding-nomade tribes, the great Turanian and Mongolian family, in contradistinction from the Aryan, Iranian or Indo-European race, and it is derived from the root "to-ar," to fly. The Turks are a very ceremonious people, and a people who think state and show indispensable; and any one by whom these are despised is looked upon by them as vulgar and ignorant, and unaccustomed to good society.

Orfa is the capital of a Turkish pashalik which extends in a north-west direction from the mouth of the Shat-ul-Arab to the rocks of Merdin, the Baghdad frontier towards Constantinople. In an east and west line, it stretches from the confines of Persia to the banks of the Khabour which separates it from the pashalik of Orfa (the Osrhoene of the Romans, and that part of Mesopotamia which contained the Harran of Abraham, and the famous Edessa of the crusades). Constantinople, the capital of Turkey, has ever been, from its central position, of importance to trade. When the mighty Roman empire was blotted out, not only the trade with India, but India itself was completely lost to the western world. But after some centuries, when the Genoese engaged in commerce and navigation, a new trade route had been opened up between India and Europe. The merchandise from the western part of India was now carried up the river Indus, as far as it was navigable, and then across country, through Samarcand, to the river Oxus, down which it was shipped to the Caspian Sea. In like manner the merchandise from China and the Moluccas was shipped across the Bay of Bengal, and up the rivers Ganges and Jumna, and then carried overland to the Oxus. Samarcand was then a great emporium, and the merchants of India, Turkey and Persia met there to exchange their wares. The ships sailed across the Caspian to the port of Astracan, at the mouth of the Volga. Thence the goods were carried up the river to the city of Novgorod in the province of Reizan (a city that must have been considerably to the south of the famous Niji Novgorod of to day), then overland for some miles to the river Don, where they were loaded on barks and carried down stream to the Sea of Azoff, and on to the port of Caffa, or Theodosia, in the Crimea. Caffa belonged at that time to the Genoese, and they came there in their galliasses to fetch Indian commodities, which they distributed throughout Europe. A glance at the map will show what a costly and roundabout route this must have been, but the merchants of those days were clearly of opinion that there is nothing like water-carriage, and they made use of the rivers wherever they could. In the reign of Commodita, emperor of Armenia, a better route was discovered, the merchandise being transported from the Caspian Sea through Georgia to the city of Trebisond, on the Black Sea, whence it was shipped to all parts of Europe. This was doubtless the origin of the connection of the Armenians with the trade of India. So highly was this route approved of, that another Armenian emperor is said to have actually begun to cut a canal, 120 miles in length, from the Caspian to the Black Sea, for the greater convenience of the trade; but the author of this scheme was slain and the enterprise fell through.—*Rich's Residence in Koordistan, vol.* i. *p.* 7. *E. TURKOMAN, the name given to the peoples occupying the country south of the Oxus or Turkistan, stretching from Balkh to the shores of the Caspian, and filling up the space between that sea and the Aral. On the south it is bounded by hills, the continuation of the Hindu Kush, and the Parapamisus of the ancients, and a line drawn from Balkh to Astrabad on the Caspian will separate the country of the Turkoman from that of the Afghans and Persians. On the south-eastern shore of the Caspian, the country is mountainous, but in all other places it is a flat sandy desert, into which the mountain streams, the Murghab and the Tejend, fall and are absorbed, and never force their passage to the Oxus. The Turkomans are exclusively nomade, in which they differ from the Uzbeks; the total number of families is 140,000. According to Sir John Malcolm, Turkoman is an abbreviated compound of Turk-manund: the latter term signifies " resembling." The Turkoman are a wandering and marauding race. They are divided into several tribes, often at feud with each other, and always hostile to the rest of mankind. The Persians fear and detest them, the fact of their being sunni mahomedans rendering them still more obnoxious in the eyes of the shiah Persians. The aggregate number of the Turkomans is not known. The Turkoman is a shepherd and neatherd; the warlike Kurd is pastoral and nomade; the Georgian is largely endowed both physically and mentally, but are less tenacious in purpose. Amongst their families are treasures of female beauty. The Turkoman inhabit the countries which lie between the eastern shore of the Caspian and the river Moorghab; this is the extreme length of their territory. There are some encampments of them beyond this river, but they are very few in number. In breadth they may be said to occupy the country from the line formed by the Goorghan and the prolongation of the Elburz chain (north of Boojoord, Deregex, Koochan and Meshed), up to the deserts of Khiva and Bokhara, and they are sure to be met with where the soil is fertile and well watered. A tribe or two, here and there, may also be seen on the banks of the Oxus. It is a rare occurrence to find them living in villages; when this happens they have been forced to do so by the sovereign who has subdued them. These people have been accustomed, from the most remote ages, to dwell in tents, which enables them to wander about with their flocks with greater facility. This mode of life is also a means of escaping from the Persian dominion, of which they have always been, and to this day remain, the most determined enemies. The wants of a Turkoman are few in number, a tent, called a khirgah, shelters the whole family, and this is of a superior manufacture to any thing of the kind made by the nomadic tribes of Persia. They can make these khirgah warmer than the best-built houses—a matter of some consequence to them, seeing how severe the winters are in the country they inhabit. The khirgah is conical in form, the frame-work being made of laths of hard wood interlaced one with the other, which can be opened or folded up at pleasure, according as they wish to camp or decamp; a camel, or at most two, is able to carry this tent. Thick felts are stretched either entirely or partially across this framework, according as the Turcoman may wish to avoid the burning rays of the sun or protect himself from the rain or cold: they are very commodious, and of all sizes, and a high price is given for them by some of the Persian nobles.

The Turcoman, whose principal occupation consists in making chap-aouls, or raids, upon the Persians, belong to the three following tribes.

The Yamood, settled beyond the river Attrak, near the shores of the Caspian Sea, and between this and Khiva, consisting of 25,000 families. They are the least ugly of the Turkoman tribes.

The Goklan, on the banks of the Goorghan and the Attrak, between Astrabad and the Attrak consisting of 12,000 families.

The Tekie, who are separated from the Kurds by a chain of mountains which extend from the sources of the Goorghan and the Attrak near Sharaks, consisting of 35,000 families. They wander between the sources of the Attrak and the town of Merv.

The Turcoman are of a Turk race, which, in the 11th and 12th centuries, overran Bokhara, Northern Asia, and, on the westward of the Caspian Sea, Armenia, Southern Georgia, Shirvan and Daghistan. They lead a nomade life, and compose the principal part of the population of these countries, where they are called Tarekameh, Turkmen, and Kizilbashi. To explain the name of Turcoman, the Persians relate, that the Turk tribes, at the time of their invasion of Khorasan, had married the women of the country, and that to their descendants were given the name of Turcoman, which means, like the Turks. This specious etymology appears very paradoxical, since the hordes of this people, who speak Turkish, and have remained beyond the Jihon, also call themselves Turcoman. Klaproth thinks the name rather derived from Turk and Coman, and given to that part of the Coman nation which remained on the east of the Caspian Sea, under the domination of the Turks of the Altai, while another part, which was independent, came and established itself in the vast plains to the westward of that sea, and to the north of the Sea of Azof, and who afterwards pushed forwards into Hungary.

The steppes of Turcomania are very favourable to the development of the equine race, the pasturage and artificial grasses grow in dry soils, having no other nourishment than the winter snows. The fodder thus produced is much more sweet and nutritious than that of the more moist and temperate climates. It produces in their horses a higher temperature and better condition of the blood, as well as a peculiar elasticity and strength of nerve and muscle perfectly wonderful. Green food is produced on these steppes only in the spring; at that season the Turcoman refrain from making any expeditions, and this state of abnegation continues to the end of July. During this period they have time to gather in their crops, and their animals rest those limbs which have so well done their duty the previous season. From the month of August up to the winter they are kept on dry food; this consists of seven pounds of barley per diem, mixed with dry chopped straw, lucerne, sainfoin or clover-hay, unless a chap-aoul is coming off, in which case the horse is put upon half forage.

The Turcoman horses are a modification of the Arab breed, and as good in every respect as the famous horses of the desert. They differ, however, in respect to height, and their form is more developed. Tamerlane introduced new blood by dispersing amongst the tribes 4200 mares, which he had selected in Arabia from the very best breed. Afterwards, Nadir shah renewed this cross with 600 mares, which he confided exclusively to the Tekie tribe. The horses of this tribe are now held in the highest estimation in all Turcomania, especially those from the district of Akhal. The next in reputation after the Tekien horses are those of Mero-Shah Jehan, the horses of the Yamood and the Goklan, and the race of the Moorghab, of the Hazarah, the Uzbek of Meimana, Shibberghan, &c. In the interesting little work by general Daumas on the horses of the Sahara, are a number of curious notes and answers by Abdul Kadr. On being asked how many days the Arab horse can march without resting or being injured, he answered, that if the horse has as much barley as he can eat, he will perform 16 parasangs (64 miles) a-day for three or four months, without a single day's rest. He also states that he has known a horse go from Tlemsen to Mascara in a single day, a distance of about 50 parasangs (200 miles). After such a journey he says the horse ought to be spared the next day. General Daumas relates several anecdotes, within his own knowledge, of Arab horses having gone distances of 70 and 80 leagues, from 170 to 200 miles, in 24 hours.

The Turkoman inhabitants of the deserts, who formed part of the host of Timur, have ever been famous for their terrible inroads into the Persian province of Khorasan. They are Turkomans of the Sooni creed, a cruel and rapacious race, and always prefer fighting to facing a superior force. The arms of the Turkoman are a spear ten feet long and a sword. They are excellent horsemen, and pass their lives in pillage and rapine. Their raids are called chapao. When a chief determines upon making one, a month is given to his followers to get their horses into proper condition. Spies are sent out and on news being brought, the whole party gallops swiftly on the prey, whether caravan or village. In a few minutes all is over, the people carried off into slavery, and the village burnt. The prisoners are tied to the saddle bows of the captors and are treated with horrible cruelty until they are finally sold in the slave markets of Khiva. The horses of the Turkoman have been known to go over six hundred miles in six days.

The desert between Khiva and Merv, is a broken and irregular surface of deep sand with a small growth of brushwood affording excellent fuel, and the thorny herb which the camel loves.

Of the languages belonging to the third branch of the Turanian family, the most prominent among them is the Turkish or Osmanli of Constantinople. The number of the Turkish inhabitants of European Turkey is indeed small. It is generally stated at 2,000,000, but Shafarik estimates the number of genuine Turks at not more than 700,000, who rule over fifteen millions of people. The different Turkic dialects, of which the Osmanli is one, occupy one of the largest linguistic areas, extending from the Lena and the Polar Sea, down to the Adriatic.

The most ancient name by which the Turkic tribes of Central Asia were known to the Chinese was Hiung-nu. These Hiung-nu founded an empire (206 B.C.) comprising a large portion of Asia, west of China. Engaged in frequent wars with the Chinese, they were defeated at last in the middle of the first century after Christ. Thereupon they divided into a northern and southern empire; and after the southern Hiung-nu had become subjects of China, they attacked the northern Hiung-nu, together with the Chinese, and, driving them out of their seats between the rivers Amur and Selenga, and the Altai mountains, westward, they are supposed to have given the first impulse to the inroads of the barbarians into Europe. In the beginning of the third century, the Mongolic and Tungusic tribes, who had filled the seats of the northern Hiung-nu, had grown so powerful as to attack the southern Hiung-nu and drive them from their territories. This occasioned a second migration of Asiatic tribes towards the west. Another name by which the Chinese designate these Hiung-nu or Turkish tribes is Tu-kiu. This Tu-kiu is supposed to be identical with Turk, and, although the tribe to which this name was given was originally but small, it began to spread in the sixth century from the Altai to the Caspian, and it was probably to them that in 569 the emperor Justinian sent an ambassador in the person of Semarchos. The empire of the Tu-kiu was destroyed in the eighth century, by the Hui-he (Chinese Kao-che). This tribe, equally of Turkish origin, maintained itself for about a century, and was then conquered by the Chinese and driven back from the northern borders of China. Part of the Hui-he occupied Tangut, and, after a second defeat by the Mongolians in 1257, the remnant proceeded still further west, and joined the Uigur, whose tents were pitched near the towns of Turfan, Kashgar, Hamil, and Aksu. These facts, gleaned chiefly from Chinese historians, show from the very earliest times the westward tendency of the Turkish nations. In 568, Turkish tribes occupied the country between the Volga and the Sea of Azov, and numerous reinforcements have since strengthened their position in those parts. The northern part of Persia, west of the Caspian Sea, Armenia, the south of Georgia, Shirwan, and Dagestan, harbour a Turkic population, known by the general name of Turkman or Kisil-bash (Red-caps). They are nomadic robbers, and their arrival in these countries dates from the eleventh and twelfth centuries. East of the Caspian Sea the Turkoman tribes are under command of the Uzbek khans of Khiva, Fergana, and Bokhara. They call themselves, however, not subjects, but guests of these khans. Still more to the east, the Turkomans are under Chinese sovereignty, and in the south-west they reach as far as Khorasan and other provinces of Persia. The Uzbeks, descendants of the Huy-he and Uigur, and originally settled in the neighbourhood of the towns of Khoten, Kashgar, Turfan, and Hamil, crossed the Jaxartes in the sixteenth century, and after several successful campaigns gained possession of Balkh, Kharism (Khiva), Bokhara, and Ferganah. In the latter country and in Balkh they have become agricultural; but generally their life is nomadic, and too warlike to be called pastoral. Another Turkish tribe are the Nogai, west of the Caspian, and also north of the Black Sea. To the beginning of the seventeenth century they lived north-east of the Caspian, and the steppes on the left of the Irtish bore their name. Pressed by the Kalmuk, a Mongolic tribe, the Nogai advanced westward as far as Astrachan. Peter I. transferred them thence to the north of the Caucasian mountains, where they still graze their flocks on the shores of the Kuban and the Kuma. One horde, that of Kundur, remained on the Volga, subject to the Kalmuk. Another tribe of Turkish origin in the Caucasus are the Bazianes. A third Turkish tribe in the Caucasus are the Kumiik, on the rivers Sunja, Aksai, and Koisu.

The southern portion of the Altaic mountains has long been inhabited by the Bashkir, a race considerably mixed with Mongolic blood, savage and ignorant, subjects of Russia, and mahommedans by faith. Their land is divided into four roads, called the roads of Siberia, of Kasan, of Nogai, and of Osa, a place on the Kama. Among the Bashkir, and in villages near Ufa, is now settled a Turkish tribe, the Mescherak, who formerly lived near the Volga.

The tribes near the lake of Aral are called Kara-kalpak. They are subject partly to Russia, partly to the Khans of Khiva.

The Turks of Siberia, commonly called Tatar, are partly original settlers who crossed the Ural, and founded the khanat of Sibir, partly later colonists. Their towns are Tobolsk, Yeniseisk, and Tomsk. Separate tribes are the Uran'hat on the Chulym, and the Barabas in the steppes between the Irtish and the Ob.

In the north-east of Asia, on both sides of the river Lena, the Yakut form the most remote link in the Turkic chain of languages. Their male population has lately risen to 100,000, while in 1795 it amounted only to 50,066. Their original seats seem to have been north-west of Lake Baikal.

Southern Siberia is the mother country of the Kirgis, one of the most numerous tribes of Turko-Tataric origin. The Kirgis lived originally between the Ob and Yenisei, where Mongolic tribes settled among them. At the beginning of the seventeenth century the Russians became acquainted with the Eastern Kirgis, then living along the Yenisei. In 1606 they had become tributary to Russia, and after several wars with two neighbouring tribes, they were driven more and more south-westward, till they left Siberia altogether at the beginning of the eighteenth century. They now live at Burut, in Chinese Turkestan, together with the Kirgis of the "Great Horde," near the town of Kashgar, north as far as the Irtish.

Another tribe is that of the Western Kirgis, or Kirgis Kasak, who are partly independent, partly tributary to Russia and China.

Of what are called the three Kirgis Hordes, from the Caspian Sea east as far as Lake Tenghiz, the Small Horde is fixed in the west, between the rivers Yemba and Ural; the Great Horde in the east; while the most powerful occupies the centre between the Sarasu and Yemba, and is called the Middle Horde. Since 1819, the Great Horde has been subject to Russia. Other Kirgis tribes, though nominally subject to Russia, are really her most dangerous enemies.

The Turks of Asia Minor and Syria came from Khorasan and Eastern Persia, and are Turkomans, or remnants of the Seljuk, the rulers of Persia during the Middle Ages.

The Osmanli, whom we are accustomed to call Turks par excellence, and who form the ruling portion of the Turkish empire, must be traced to the same source. They are now scattered over the whole Turkish empire in Europe, Asia, and Africa, and their number amounts to between 11,000,000 and 12,000,000. They form the landed gentry, the aristocracy, and bureau of Turkey; and their language, the Osmanli, is spoken by persons of rank and education, and by all Government authorities in Syria, in Egypt, at Tunis, and at Tripoli. In the southern provinces of Asiatic Russia, along the borders of the Caspian, and through the whole of Turkestan, it is the language of the people. It is heard even at the court of Teheran, and is understood by official personages in Persia. The ancestors of the Osman Turks are men as well known to European historians as Charlemagne or Alfred. It was in the year 1224 that Sulaman-shah and his tribe, pressed by Mongolians, left Khorasan and pushed westward into Syria, Armenia, and Asia Minor. Sulaman's son, Ertoghrul, took service under Ala-ud-din, the Seljuk sultan of Iconium (Nicœa), and after several successful campaigns against Greeks and Mongolians, received part of Phrygia as his own and there founded what was afterwards to become the basis of the Osmanic empire. During the last years of the thirteenth century the sultans of Iconium lost their power, and their former vassals became independent sovereigns. Osman, after taking his share of the spoil in Asia, advanced through the Olympic passes into Bithynia, and was successful against the armies of the emperors of Byzantium. Osman became henceforth the national name of his people. His son, Or-khan, whose capital was Prusa (Bursa), after conquering Nicomedia (1327) and Nicœa (1330), threatened the Hellespont. He took the title of padshah, and his court was called the "High, or Sublime, Porte," the Bab-ul-makaddas. His son, Sulaman, crossed the Hellespont (1357), and took possession of Gallipoli and Sestos. He thus became master of the Dardanelles. Murad I. took Adrianople (1362), made it his capital, conquered Macedonia, and, after a severe struggle, overthrew the united forces of the Slavonic races south of the Danube, the Bulgarians, Servians, and Kroatians, in the battle of Kossova-polye (1389). He fell himself, but his successor Bayazeth, followed his course, took Thessaly, passed Thermopylæ, and devastated the Peloponnesus. The emperor of Germany, Sigismund, who advanced at the head of an army composed of French, German, and Slavonic soldiers, was defeated by Bayazeth on the Danube in the battle of Nicopolis, 1399. Bayazeth took Bosnia, and would have taken Constantinople, had not the same Mongolians, who in 1244 drove the first Turkish tribes westward into Persia, threatened again their newly acquired possessions. Timur had grasped the reins fallen from the hands of Chingis Khan : Bayazeth was compelled to meet him, and suffered defeat (1402) in the battle of Angora (Ankyra) in Galatia. Europe now had respite, but not long ; Timur died, and with him his empire fell to pieces, while the Osmanic army rallied again under Mahomed I. (1413), and re-attained its former power under Murad II. (1421). Successful in Asia, Murad sent his armies back to the Danube, and after long-continued campaigns, and powerful resistance from the Hungarians and Slaves under Hunyad, he at last gained two decisive victories, Varna in 1444, and Kossova in 1448. Constantinople could no longer be held, and the Pope endeavoured in vain to rouse the chivalry of Western Europe to a crusade gainst the Turks. Mahomed II. succeeded in 1451, and on the 26th of May, 1453, Constantinople, after a valiant resistance fell, and became, as now, the capital of the Turkish empire.

The modern distinction of Turk and Tajik, which, in its literal meaning, denotes men of military and men of civil pursuits, has existed from the most early ages in this extended country. Tajik is always applied to unwarlike peasants and citizens.—*Malcolm's History of Persia, vol.* i. *p.* 125 ; *vol.* ii. *p.* 226, 240. *Muller's Lectures, pp.* 293 *to* 295, *Ferrier Journ, p.* 87. Turmeric derives its name from "terra merita." Turmeric is the ground tubers of Curcuma longa, C. rotunda, C. angustifolia, C. viridifolia and C. zedoaria. It is extensively grown throughout the East Indies, China, and the Archipelago, for home consumption and for export. The bulbs are small and furnished with numerous long palmate tubers, internally of a deep orange colour. There are two descriptions of tubers, the one round, the other long; but both are yielded by the same plant. The first are round, oval or ovate, about two inches long, and one inch in diameter, pointed at one end, and marked externally with numerous annular wrinkles. The second are cylindrical, not exceeding in thickness the little finger, two or three inches long, somewhat contorted, tuberculated. Both kinds are yellowish, externally more or less orange yellow, passing into reddish-brown. The factured surface has a waxy appearance. The odour is aromatic, somewhat analogous to ginger, but peculiar ; the taste is aromatic. When chewed, it tinges the saliva yellow. Its powder is orange yellow. The tubers are frequently worm-eaten. Turmeric is used in dyeing a yellow colour, which is not however very permanent, and it is also largely used as a condiment in curries.

China turmeric consists of smooth, plump, round, and long tubers, of a greenish hue externally. They yield a bright powder, and on that account are much preferred for medical purposes. Thence they fetch a higher price than any other sorts of turmeric.

Bengal turmeric consists of long thin or narrow tubers, which are moderately smooth externally, of a greyish dull yellow colour, and break with a deep reddish fracture. It fetches a higher price than the Madras sort, on account of its being a much stronger dye.

Madras turmeric is the most showy. It consists principally of large long tubers, but mixed with transverse sections of round tubers. Externally the tubers are marked by longitudinal wrinkles, the surface of which is rubbed and bright yellow, internally the colour is that of a fresh fractured surface of gamboge. Specimens were exhibited at the Madras Exhibition of 1855 from Trichinopoly, Tinnevelly, Madura, &c.

Malabar turmeric and Bombay turmeric consist principally of long tubers, the round tubers being few, and of a very inferior quality. This sort of turmeric is smaller and more shrivelled than the Madras sort, but otherwise somewhat resembles it.

Java turmeric may be said to resemble the China sort. It consists of both round and long tubers, but chiefly the latter. They have a greenish-yellow hue.

Batavian turmeric, round tubers, said to be from Java. Dr. T. Martius notices this sort as having been brought, for many years, from Batavia, and adds that it contains much colouring matter, and is probably the produce of Curcuma viridiflora.

The composition of turmeric in 100 parts in John's Analysis, is shown in the following—

Yellow volatile oil	1	Gum	14
Curcumin	10 to 11	Woody fibre	57
Yellowextractive	11 to12	Water and loss	7 to 5

Vogel and Pellitier's Analysis.

Acrid volatile oil.
Curcumin.
Brown colouring matter.
Gum a (little)
Starch.
Woody fibre.
Chloride of calcium.
Turmeric.

Curcumin is the resinous colouring matter of turmeric, which is soluble only in ether. Turmeric is free of duty. Wholesale price, 6*s.* to 14*s.* per. cwt.

The kinds that are best suited for dyeing are not so good for eating, and vice versa. "Amba haldi" is the term applied to the dyer's turmeric. Turmeric is grown like ginger from cuttings, or sets, which are little pieces of the fresh root cut up and planted.

In India amongst mahomedans and hindoos, after betrothment and before marriage, the body is anointed with turmeric both in public and in private. Amongst hindoos, when they for the first time wear a new cloth or dress, they stain its four corners with turmeric, to ward off the evil-eye and guard against malignant spirits.—*Hassal Food and its Adulterations, p.* 296. *Mason's Tenasserim, Birdwood Bombay Products, Madras Ex. TURN-ABOUT ISLAND, in lat. 26° 26′ N., and long. 114° 59′ E., on the east coast of China.

TURNER, Captain, was deputed by Warren Hastings in 1783, on a second mission to Tibet, but was prevented reaching Lhassa by the state of the Government.

TURNERACEÆ, *D.C.*, an order of plants, including two species of Turnera.

TURNING LATHE of India, in its simplest form, consists of two pegs or pieces of wood driven into the ground, with a short iron peg projecting from each inwardly; these constitute the centres. When the centres get slack, the pegs, or heads of the lathe as they would be called, are driven a little firmer and further in; or should this not suffice, the pegs are pulled up and driven into fresh ground. The rest consists of a cross piece of wood with a handle like a wooden mattock or coal-rake. This is placed in front of the lathe and steadied by the foot. The work to be turned is spun backwards and forwards by a bow held in the right hand: the tool is managed with great dexterity by the left hand and foot, the rest being steadied by the right foot. The native workman is almost literally quadrumanous, and can make his feet and toes almost as serviceable as his hands and fingers. The lathe costs about Rs. 2, and a native workman will turn out on this as much rough work as an Englishman will on the best foot-lathe. The tools mainly consist of short bars of steel sharpened at both ends, each end being used alternately; an old file, or anything else that will cut. They have seldom a good edge—they are set on a fineish-grained sandstone, not capable of making them very sharp. A better variety of lathe has the two heads coupled together by a bar, and made fast by wedges: the other arrangements are the same in both. From these two, bed-posts and pieces of wood, from a quarter of an inch to eight inches in diameter, are turned out. Instead of being painted, the works are lacquered on the lathe by holding on a piece of resin coloured with some mineral paint. They give, in this way, at a most insignificant price, the effect of highly polished varnished work. The lathe with one centre and chucks for turning hollow cups and fancy work, is a much more perfect and highly finished implement than the lathes of two centres. It consists of a strong platform of wood, from two to three and a half inches thick, and one by one and a half or two feet square. The heads are morticed into this: an iron post secures the spindle end—the other works with a wooden collar and washer. The chuck is fastened on without screwing. Like the other lathes, it is worked with a bow, but the bow itself in this case is a neat and well finished implement. The tools and mode of working are the same, or nearly so, in all. In this lathe, the most beautiful ebony and ivory work is turned with singular neatness and speed; and we should say a native would beat any European with this variety of implement. They turn off with celerity beads, spheres, balls, boxes, backgammon men, and plain chessmen,—for each of which half a dozen of turns seem to suffice.—*Dr. Buist in Bombay Times.*

TURNIPS, Brassica rapa, require a free light soil; the manure applied to the soil ought to be kept near the surface; one variety, the yellow Maltese, is worthy of a trial on the plains; raised from seed, sown broad cast, when the plants have formed a few leaves, they should be thinned to about 6 inches apart; used in soups, stews, &c. Turnips are cultivated in all parts of the Deccan at the commencement of the rains and the cold weather. They continue until the latter end of February, and go to seed easily.—*Riddell. Jaffrey.*

TURNOULI. An Afghan race, who chiefly belong to Hazara, but they hold lands on both sides the Indus. They leagued with the Jadoon tribe of the Mahaban, and with the Chuggerzye, Hussunzye and other northern Pathan tribes, they proved most formidable opponents to the Sikhs. The district of western Turnouli is a petty principality, with a geographical area of 250 miles south-east, and a revenue of rupees 28,000 per annum, held as a fief from the Indian government, and its chief possesses independent internal jurisdiction. The tract chiefly lies on the left bank of the Indus, a portion only being on the right bank, and confronts the Hussunzye country. It is inhabited chiefly by the Turnouli, a tribe of martial Pathans. A recent chief, Payuda Khan, was a wild and energetic man, and was never subjugated by the Sikhs or by the Jummoo rajahs. His son, Jehandad, though loyal and respectable, was wanting in moral and physical force. He behaved well to Gholab Sing at a time when that chief had no friends in Hazara, and was confirmed in his fief and received some additional landed grants.

TURNOUR, GEORGE, son of the Honorable George Turnour the first Earl of Winterton, was born in Ceylon, in 1799, educated in England, and entered the Ceylon Civil Service in 1818. He wrote on the Buddhist History of Ceylon, and Indian Chronology, in vols. v. and vi. of Bengal As. Soc. A series of essays on the Pali Buddhistical Annals. But his great work was his translation of the Mahawansa. He died at Naples 10th April 1843.

TURON BAY lies to the north-westward of Cham Callao Island in Cochin-China, and is called by the natives Han-san.

TUROOI. BENG. HIND. Luffa acutangula.

TUROO-LUTA. BENG. Ipomœa quamoclit.

TURPANA, properly written Tharpana. Amongst the hindoo races of India, a water oblation, an oblation offered to the gods before eating. The hindoos, at the time of bathing, present water daily to the gods, to the sages, to the yaksha, naga, gandhurva, apsara, asoora, vidyadhara, pishacha, siddha, and to their deceased ancestors. This water oblation they call tharpana, and it should be performed three times a day. Brahmins wash the whole body before eating; the Kshutree, Vaishya and Sudra only the hands and feet. They then assume the yellow silk vestment, which covers them from the waist downwards, and is the sole article of dress worn at meals. In Guzerat, each person has a small oblong wooden stool to sit upon, and the food is placed on a similar stool or short-legged table. The vessels used are brass or copper—a flat round dish, containing bread and preserves, or condiments, and two or three cups of pottage and vegetables. The water-vessel, of silver or brass, with a small drinking cup set upon it, stands on one side. The second course is composed of rice and curds, or similar food. On great occasions, however, the fare is more varied and costly. Ablutions after meals are confined to the hands and face. The men of the family eat at the same table, then the women clean the same vessels, and use them for their own breakfast. The servants take their food after the family breakfast is finished, and they use different vessels. The men chew betel-nut after meals. They strive to avoid the incurring defilement from the touch of a person of lower caste. Such pollution, however, when it occurs, is remediable by the use of "punch guvya," or the five articles derived from the cow, and by fasting for the remainder of the day. The second meal, which is a lighter one, is eaten at about eight in the evening. A brahmin traveller preparing for dinner makes a place called "choko," the floor of which he spreads with cow-dung and earth, moistened with water. When at home, his own "rusodo" or cooking-room, is the place employed, but if necessary, the choko may be made under the shade of a hedge by the way-side, or in any other convenient place. Upon the choko he raises a little temporary stone, which he smears in like manner with cow-dung, and thereupon he cooks his food. The Poorbeea, or eastern brahmins, carry their exclusive notions upon this point to such a length that brothers even are forbidden to use the same choko, nor may one take fire from the stone of another. Hence the saying, "Twelve Poorbeea and thirteen choko," because with that number of brahmins an extra stone would be required for the fire alone. The brahmin, when his food is ready before eating, performs the tharpana, that is to say, he fills a copper cup with water, and puts therein a few grains of barley, some sesamum, leaves of the sacred basil tree, sandal, &c., then holding some sacrificial grass, he fills his joined hands with water, which he pours back again into the cup, saying, "I offer (make turpun of) this water to all the Dev." He proceeds to make similar offerings of water to men, animals, trees, rivers, seas, to the bhoot, pret, reeshee, progenitors, and other." Then he mentions the names, as many as he can recollect, of his father's ancestors, his mother's ancestors, and his own deceased friends. He now performs the homa, or fire-sacrifice, by throwing a portion of rice and clarified butter into a little copper or earthen vessel, containing fire, repeating, while so employed, the names of the Deva. The brahmin sets aside five portions of food, for cows, beggars, dogs, ants, and sparrows. He then takes a little of each dish, and offers it to the Deo, in a vessel containing five divisions. He now sits down to his breakfast ; but, before commencing, repeats the gayatri over a handful of water, with which he sprinkles his own food, and three portions which he sets apart for Bramha, Vishnu, and Siva The first five mouthfuls he swallows are for the "Punch-pran," or five airs supposed to be in the body and necessary to existence. At the conclusion of his repast, he deposits upon the ground a little of what remains, as an offering on behalf of the spirits residing in hell. Long practice enables the brahmin to acquit himself of the performance of this very elaborate and painful ceremonial in less time than is occupied in the description. Brahmins frequently consider it necessary that they should observe practices of peculiar difficulty in order to maintain their superiority over the other castes. Of these the most strict is an observance of the Nagur brahmins, called "Nuven," or purity in regard to food. The brahmin, having bathed, dresses himself in silk or woollen clothes, or if he require to use cotton garments, these must be dipped in water, wrung out, and dried in some place where nothing impure can touch them. Thus habited, he sits down to dinner, but he must preserve himself from numerous accidents which would render him impure, and compel him to desist from his meal. If he touch an earthen vessel he is defiled, unless the vessel have never contained water. The touch of a piece of cotton cloth, or of a piece of leather or paper, which he may accidentally have sat down upon, renders him impure, but if hindoo letters have been written on the paper they preserve him from defilement, because they represent Saraswati, the goddess of learning, the sakti of Brahma. If, however, letters be written on cloth or leather, these remain impure. Thus if the Gita, or any other portion of scripture be required for use at the time, it must be bound with silk and not with cotton, leather must be avoided, and instead of common paste of flour and water, the book-binder must employ paste of pounded tamarind seed. A printed book will not answer the brahmin's purpose, because printing ink contains impure water. Some think that the touch of deer-skin does not defile. Raw cotton does not render the brahmin impure, but if it have been twisted for the wick of a lamp by a person not in the state of "Nuven" it does ; and again, if it have been dipped in oil or clarified butter it does not. Bones defile, but women's ivory armlets do not, except in those parts of the country where they are not usually worn, and then they do. The touch of the child of the same caste who has not learned how to eat grain does not defile, but if the child have eaten grain it does. The touch of a donkey, a dog, or a pig defiles, some say that the touch of a cat also defiles, others are inclined to think that it does not because, in truth, it is not easy to keep the cat out. If a brahmin who is in 'Nuven' be eating, or if he have risen from eating, the touch of his person defiles another brahmin who is in 'Nuven,' but has not begun his dinner.—*Forbes' Ras Mala or Hindoo Annals, vol.* ii. *from p.* 256 *to* 259. TURPENTINE.

Ratenuj-rumi,	AR.	Trementina,	IT.
Butum,	,,	Terebinthina,	LAT.
Terebenthine,	FR.	Zungbari,	PERS.
Turpentin,	GER.	Terpentyna,	POL.
Turpintine,	GUZ.	Skipidar,	RUS.
Kelon-ka-tel,	HIND.	Kota,	NEP.

Turpentine is obtained in the north of Europe, America and in the Himalayas, from species of Larix of Abies and Pinus, or the fir and pine and larch trees, as also from trees of the genus Pistacea in Canada. The Abies excelsa, the Norway Spruce Fir, yields the Burgundy pitch of commerce ; the Canada balsam is from the Abies balsamea ; Venice turpentine is obtained from Larix europæa ; common turpentine is obtained from Pinus sylvestris, and other species of pine and fir, as also from the Pistacea terebinthus. The Pinus morinda of the Himalayas yields spontaneously a very fine resin. Cedrus deodara or Himalayan Cedar, is an elegant and lofty tree, hardy as the larch, and yielding valuable timber. It has been extensively introduced into England by the East India Company, and is interesting as having been long employed in medicine by the hindoos, and known even to Avicenna. Its turpentine, known by the name kelon-ka-tel, is in great repute in the north-west of India, from its stimulant properties and power of healing deep-seated ulcers, as in elephants and camels. —*Royle Productive Resources of India.*

TURPENTINE OIL.

Oil of Turpentine,	ENG.	Turpontine,	HIND.
Eau de raze,	FR.	Acqua di rasa,	IT.
Huile de terebenthine,	,,	Aguarras,	SP.
Turpentinöl,	GER.		

This essential oil is drawn from turpentine by distillation. There are two sorts ; the best, red, and the other white. That distilled from the turpentine of the common long-leaved fir of the Himalayas, is of very superior quality. Turpentine oil is extensively used in the manufacture of varnishes, &c.—*McCulloch, Royle's Productive Resources of India.*

TURQUESA. SP. Turquoise.

TURQUIA. SP. Maize.

TURQUOISE. ENG. FR.

Turkiss,	GER.	Turchina,	IT.
Ferozah,	HIND.	Turquesa,	SP.

Found at Khojend in Mawar-al-nahr or Trans-Oxiana, at Shebavek, in hills near Shiraz, in the Tibet hills, in Kirman, and in a mountain of Azerbijan, where the mine was discovered about fifty years before Ahmed bin Abd ul Aziz composed his Treatise on Jewels. He describes the mine at Nishapur as most celebrated from early ages for that particular kind of turquoise, entitled Abu Ishaki, which, says he, averts evil from those who wear it, conciliates the favor of princes, augments wealth, preserves the sight, ensures victory over an adversary, and banishes all unpleasant dreams. The ancient sages, when first they beheld a new moon, immediately after fixed their eyes, says he, on the Firozeh. The turquoise of Nishapur is the best. The turquoise, from whatever source, is apt to change colour, if brought in contact with acids, musk, camphor, or other scents, and possibly from the state of the weather. Small clear Persian stones (for it is chiefly found at Nishapur in Khorasan) sell at 6*d.* to 20*s.* each, whilst a fine ring stone will realize from £10 to £40, a perfect stone of the size of a shilling and of good depth was sold for £400. It varies from white to fine azure blue, but it is only the fine blue stones that are of any value. Turquoise is still, in England, believed to protect the wearer from contagion, a belief, as regards that and other stones, very common amongst the ancients. From the Persian name ferozah is the color called Ferozah rang, turquoise blue. The best are from Nishapur, and are described by Ferrier, as classed into eight kinds—fatahi, azhari, sulimani, zanwi, asmani, abd-ul-hamidi, Indalisi, kanjinya. Turquoise of Badakhshan is of a blue colour and is inferior to that of Nishapur. Turquoise is rather a favourite stone with the mahomedans of India. Its various localities have only recently become known. Tavernier remarks that the turquoise is nowhere to be found but in Persia, where there are two mines. The one is called the Old-Rock, three days' journey from Meched, towards the north-west, near a great town which goes by the name of Michabourg. The other, which is called the New-Rock, is five days' journey off. Those of the New-Rock are of a paler blue inclining to white, and less esteemed, so that you may have a great many for a little money. Some years before, the king of Persia commanded that no turquoises should be digged out of the Old-Rock, but only for himself, making use of those turquoises instead of enamelling, of which the Persians are altogether ignorant, to adorn hilts of swords, knives and daggers.

Turquoises are abundant at Leh, and are plentifully found in the more remote regions of Tartary and Yarkand. Some of these stones are as large as a pigeon's egg, and without a flaw ; Mrs. Harvey saw some of even double that size, though not perfect. Indeed, the majority were flawed extensively. A small stone, tolerably perfect, costs from one to ten shillings. At or near Khojend is a turquoise mine, but the stones found there are of a greenish hue and far less esteemed than those of Nishapur, in Khorasan. There is another of very insignificant note somewhere in Kerman.—*Fraser's Journey into Khorasan, p.* 105. *Adventures of a Lady in Tartary &c. Mrs. Harvey. vol.* i, *p.* 355. *General Ferrier. Ousley's Travels, vol.* i. *p.* 211. *Emmanuel. Tavernier's Travels.*

TURTLES are of two kinds,—of the family Trionycidæ or fresh water turtles, and of the Chelonidæ or marine turtles, viz. :—

Fresh water turtles : Trionycidæ.
Emyda granosa, *Gunth.* India.
„ Ceylonensis „ Ceylon.
„ vitrata, *Peters.* Goa.
Trionyx sinensis, *Wiegm.* China, Chusan, Formosa.
„ Gangeticus. Nepal, Ganges, Penang.
„ Javanicus. *Schw.* India, Java.
„ ornatus, *Gray.* Siam, Cambogia, Borneo.
„ Guntheri, *Gray.* India.
Chitra. Indica, Nepal, Malay and Eastern Archipelagos.

Marine turtles : Chelonidæ.
Caonana olivacea, *Gray.* Indian seas.
Chelonia virgata, *Gray.* Indian coasts.
Caretta squamata, *Gunth.* Archipelago, Maldives, Ceylon.

Dermatochelys coriacea, *Gray*. All seas.

Fresh water turtles are of no use to man. Marine turtles form an important article of food, and their scales are valuable as the tortoise shell of commerce. Four different kinds are distinguished at Cape York and the Prince of Wales' Islands. Three species of these can be identified as the green, the hawksbill, Caretta squamata, and the loggerhead, Caouana olivacea; and the fourth, a small one, which is said to be caught by a live sucking fish (Echeneis remora) being secured by a line passed round the tail, and thrown into the water in certain places known to be suitable for the purpose; the fish while swimming about makes fast by its sucker to any turtle of this small kind which it may chance to encounter, and both are hauled in together.

The green turtle is of so much consequence to the natives of the Archipelago, that they have distinguished it by a special name taken from the animal itself (sulangi, from sulur). The season of the year when it is most plentiful at Cape York, usually extends from about the middle of October until the end of November, but the limits are not constant. During the season they are to be seen floating about on the surface of the water, often in pairs, male and female together. A few are caught at night on the sandy beaches, but the greater number are captured in the water. The canoes engaged in turtling, besides going about in the day, are often sent out on calm moonlight nights. When a turtle is perceived, it is approached from behind as noiselessly as possible,— when within reach, a man in the bow carrying the end of a small rope jumps out, and getting upon the animal's back, with a hand on each shoulder, generally contrives to turn it and secure it with the rope before it has got far. This operation requires considerable strength and courage, in addition to the remarkable dexterity in diving and swimming possessed by all the blacks of the north-east coast of Australia and Torres Strait. There, are some favourite look-out stations for turtle where the tide runs strongly off a high rocky point. At many such places, distinguished by large cairns of stones, bones of turtles, dugongs, &c., watch is kept during the season, and, when a turtle is perceived drifting past with the tide, the canoe is manned and sent in chase. At the islands of Talen-Talen many thousands could be easily procured. The Malays watch during the night, to ascertain where the turtle deposits her eggs. for as soon as she has finished her task, she covers them with her flippers with sand, and immediately retires into the sea. A piece of wood is then put up as a mark for the nest, which is rifled as occasion requires. It is said as a curious fact, that the male turtle never lands. On the south-western coast of Ceylon at certain seasons, the flesh of turtle is avoided as poisonous. At Pantura, to the south of Colombo, twenty-eight persons who had partaken of turtle in October, 1840, were immediately seized with sickness. The hawksbill-turtle, which supplies the tortoise-shell of commerce, was at former times taken in great numbers in the vicinity of Hambangtotte during the season, when they came to deposit their eggs. This gave rise to the trade in tortoise-shell at Point de Galle, where it is still manufactured into articles of ornament by the mahomedans, but the shell they employ is now almost entirely imported from the Maldives. If taken from the animal after death and decomposition, the colour of the shell becomes clouded and milky, and hence the cruel expedient is resorted to of seizing the turtles as they repair to the shore to deposit their eggs, and suspending them over fires till heat makes the plates on the dorsal shields to start from the bone of the carapace, after which the creature is permitted to escape to the water. At the period of breeding, the identical tortoise is believed to return again and again to the same spot, notwithstanding that, at each visit, she may have to undergo a repetition of this torture. In the year 1826, a hawksbill turtle was taken near Hambangtotte, in Ceylon, which bore a ring attached to one of its fins that had been placed there by a Dutch officer thirty years before, with a view to establish the fact of these recurring visits to the same beach. The finest tortoise shell is exported from Celebes to China; the natives kill the turtle by blows on the head, and immerse the shell in boiling water to detach the plates. Dry heat is only resorted to by the unskilful, who frequently destroy the tortoise-shell in the operation. The midas turtle is said to lay from ten to twelve dozens of eggs, and Der. coriacea from eighteen to twenty dozens at once; but many of the marine turtles lay from one hundred to two-hundred and fifty. The eggs are generally hatched by the sun in three weeks. On escaping from the eggs, the young are of a white colour, and in size a little larger than a rupee; but few survive the attacks of sea-birds, herons and storks, in their way to the ocean, and the sharks and shark-toothed fishes when there. The flesh of the hawksbill turtle is not held in esteem, but the plates of its shell being thicker, stronger, and cleaner than those of any other species, it is of great importance as an article of trade. When heated in boiling water it softens, and by pressure can be made to assume any form, or two pieces can be made to adhere. In this state gold, silver, and other metals are made to adhere to tortoise shells.—*Journal Indian Archipel. vol.* iii. *p.* 227, 1849. *Tennent's Sketches of the Natural History of Ceylon, p.* 294. *Gunther's Reptiles of British India. Macgillivray's Voyage, vol.* i. *p.* 21-2. *Marryat's Indian Archipelago, p.* 123-183. *Mr. J. Rohde MSS.* See Tortoise shell.

TURTLE-DOVE. A bird of the genus Turtur.

TURTUMAGLIO. It. Turmeric.

TURTUR, a genus of birds, the turtle-doves, of the sub-family Turturinæ and order Gemitores. Their generic name in the Urdu is "Fakhta." The Indian species are—

T. rupicolus, *Pallas*, the ashy turtle dove, of Northern and N. E. Asia, Himalayas.
,, meena, *Sykes*, the rufus turtle-dove, all British India.
,, Cambayensis, *Gm.*, the little brown dove, all British India.
,, Suratensis, *Gm.*, spotted dove of all British India.
,, resoria, *Linn.*, common ring dove, Africa, Malay peninsula, Java, and Archipelago.
,, humilis, *Temm.*, red turtle dove, British India, Archipelago.

Turtur bitorquatus, *Tem.*, of Java, Timor, &c., has the grey of the crown and wings, and the vinaceous of the neck and breast deeper and brighter than in the others, black semi-collar moderately broad, and margined (more broadly above) with white; beneath the wings very dark ashy, and vent and lower tail-coverts white.

Turtur brevicaudatus, *Blyth.*, is a more aberrant species, and remarkable for its short tail, in which respect the Malayan T. macrodactylus, *Strickland*, is intermediate to this and the preceding species. Size comparatively small. Length about 5½ in., of which tail 1⅝ in., its outermost feather ⅝ in. shorter than the medial; closed wing 2½ in.; more rounded than in the two other species, having the sixth to the tenth primaries subequal and longest ; bill to gape 13/16 in, tarse ⅞ in. Colour of the upper parts somewhat rufescent, and the feathers soft and less elongated, of a rich olive-brown, black-bordered, and paler towards shaft; at forehead inclining to ashy and scarcely stiffened: plumage over the rump discomposed and excessively dense and copious, throat mingled dusky and whitish and rest of the lower parts weak ferruginous, deepest on middle of belly, vent and lower tail-coverts ; a series of whitish, terminal specks on the great range of wing coverts, and others tipping the secondaries and tertiaries.

Turtur Dussumieri, *Tem.*, with broad collar from Malasia and the Philippines, has never been seen from continental Malasia (*i. e.*, the Malayan peninsula), where T. tigrinus abounds, distinct alike from T. Suratensis and T. Chinensis.

Turtur humilis, *Tem.*, of India, is somewhat less affined to the rest, and is very remarkable, among the Columbidæ, for the diverse hue of the sexes.

Turtur risorius of India, has the third primary a little shorter than the 2nd, and the 1st ¼ in. shorter, and the 4th ⅜ in. shorter than the 2nd; tail-feathers sub-even or slightly rounded, except the outermost pair, which are ½ in. shorter than the medial. Nuchal semi-collar much narrower than in the others, and no vinaceous hue on the nape below it ; beneath, the wings are whitish, and the vent and lower tail-coverts are of a dull ash-grey.

Turtur rupicola, *Pallas*, replaces T. Meena in the Simla and Masuri hills. Other Indian species are named T. auritus, T. chinensis, T. orientalis, T. vinaceus.—*Blyth, Report ; Jerdon, Birds.*

TURUI Beng. Luffa, *sp.* Water melon.

TURUNEE. Sans. From tree, to save.

TURUNJ. Arab. Citron.

TURUNJABIN. Pers. Manna obtained from the tamarisk and camel's thorn, Alhaji maurorum.

TURUSHKA, a name of the Scythi who invaded India ; a hindoo name for the mahomedans of India, Tartary, and Kabul. See India. Turishka.

TURUSHU, also Nila tutam. Tam. Sulphate of copper.

TURVASA, a name of Tartary. See India. Turan.

TURWAR. Hind. Cassia auriculata.

TURWEEAH, the eighth day of the mahomedan month, Zeehuj, is so called.

TUS or Tuz, a birch bark, upon which, in addition to leather, we learn that the ancient Persians wrote. The same seems also to have been anciently used in Northern India. In Huen Thsang's time, the early buddhist scriptures of Kasyapa's council were written on the leaves of the Tala palm. In the eleventh century, according to Alburini, paper was used ; in the south of India the leaves of the Tar tree are still used, but in the provinces of Central and Northern India, they used the inner bark of a tree called tuz, and it was the branch of a tree of the same kind called bh [redacted] species of Morus or Betwa, with w y covered their vessels.—*V.* 2, *p.* 46.

a ancient city of Khorasan, two ma E. from Neshapur, and a little to the he modern town of Mesh'hid. It consi o towns, Tabaran and Nukan, and w place of considerable importance, b devastated by the Uzbeks in

996 H. (1588 A. D.), and its place has been taken by Mesh'hid.

TUS, or TUSH. Hind. Wool: shawl-wool. The 1st quality of shawl wool, is called shah-tus or ash-tus. Tus khudrang. Hind., or gray-tus, is the second quality of shawl-wool, its name meaning wool of natural colour.

TUSBEEH, a mahomedan rosary or chaplet of beads, made of date stones, fish bones, cornelian, Mocha stones, pearls, mother of pearl, coral, the seeds of the Canna Indica or Indian shot, olive stones, onyx, ebony, Ocymum pilosum, basilic basil, agati, the seeds of the Corypha umbraculifera, the earth of Karbillah, sandal, and the stones of the Cicca disticha, chulimilli or churmayla.—*Herklots.*

TUSCAN. See India, Semitic races.

TUSE. Hind. Coscinia *sp.*, also Ficus Roxburghii.

TUSHASPA. See Inscriptions.

TU-SHEEAH. A shiah mahomedan is so called.

TUSHI-RANG. Hind. Dark brown-gray colour.

TUSHRIK. Arab. Days of communion.

TUSHTUREEAN. Small plates.

TUSHTU KHAN. See Kalkas.

TUSI. See Skyin.

TUSLEEM. See Islam. Salam.

TUSSAH. A kind of silk cloth prepared from a wild silk worm and woven, in some districts in Bengal, into silk of a fine description, much used for ladies' and children's dresses, and in most parts in India for native use, being worn by hindoos for certain ceremonies and while bathing: it is an article of export. In the Dekhan, the tussah worm breeders are a class quite distinct from the weavers, and are either Telingas of low caste or Gonds; the former reside principally at Chilpore, Madapore, and Chinnore. At Madapore, which may be regarded as the centre and head-quarters of the tussah breeders, there are at least seventy families. The tussah breeder never thinks of keeping up the breed of the insect throughout the year. When the leaf is off the tree about the middle of March, he deems his occupation gone, and he leaves the object of his former excessive care to shift for itself, thinking of nothing but the present ease which may be summed up in a few words—sloth, a bare subsistence, and an occasional debauch in his nectar, palm toddy. But with the rains returns his toil, and some little difficulty is experienced in procuring insects for a fresh campaign. If he can gather a dozen of promising cocoons which his experience tells him are of females, he is quite satisfied Carefully does he watch the bursting of the cocoon, and much care does he take of its winged inmate, having previously prepared for it a house of teak leaves dried. The male is not tardy in approaching. Impregnation takes place, the male dies, and in four days after laying her eggs, the female also. The eggs are in number about sixty: of these one half prove abortive, while the others are hatched in ten days. The small insect is fed on the tender leaves of the Careya sphærica, and in six weeks spins its cocoon; the first brood are spared and allowed to burst their cocoons to supply a sufficient quantity of ova the tusser harvest. The same process is described as again gone through, with this exception, that the young worms are at this time fed on the leaves of the Pentaptera tomentosa, because those of the Careya sphærica are by this period of the season, supposed to have acquired some influence noxious to the insect. It is during the progress of the worm from the egg to the formation of the cocoon that every energy of the tussah breeder is called into action for the preservation of his charge. Every animal, footed, winged and creeping, is said to be the enemy of the tussah grub. Ants destroy them, kites and crows prey on them, snakes devour them, and squirrels are said to make a repast of them. To protect them first from their insect enemies, the tussah breeder ascends the "muddy" tree (Pentaptera tomentosa), the leaves of which are the insect's food, every branch he carefully clears of the different species of ants by which they may be infested, preventing the access of others by surrounding the trunk of the tree at its foot with ashes. The other enemies are kept off by shouting, throwing stones, firing guns, &c. Their life at this time would appear by their own account, to be one of the most unremitting toil, to devote themselves to which they forswear not only every indulgence but every comfort, and it rouses the apathetic peasant of Telingana to eloquence when he recounts what privations he undergoes, what pleasure he derives himself, and what incessant labour he incurs, while watching the rearing of the worm, and the perfecting of its work. The tussah butterfly is a species of Saturnia, probably the paphia, described by Dr. Helfer as the most common of the native species. From four to five hundred of the cocoons are sold to the banya and weavers for one rupee; the moth is killed by means of heat. There are three tussah harvests, one at the end of the rains, the other two in the cold season. The winding of the silk is accomplished by boiling the cocoons, separating the floss, of which no use is made; and twisting eight or ten filatures from as many cocoons on the middle of the thigh with the left hand of the workman and to be wound on the instrument; this instrument, the middle bar of the wood, is held lightly in the hand of the workman and made to move in a semi-circle. An ounce and a quarter of silk is the average daily winding of a single workman; his wages are at the common rate of one pice for winding the silk of fifty cocoons, about three pice a day, as he cannot wind more silk than from a hundred and fifty cocoons. The pice, however, are large, and go there by eight to the rupee. The only dyes used for the tusser silk, so far at least as observation or inquiry has gone, are the flowers of the palas, Butea frondosa, and turmeric; by the former the usual familiar colour is produced; by the latter golden yellow is brought out after the threads are for some time immersed in a solution of ashes. The warp threads are stiffened with rice congee. Tussah is made into the saree, punchee and scarfs, at several towns of the sircar of Warungul. But in the Dekhan, the chief seat of the tussah manufacture is the town of Madapore—on the right bank of the Godavery in the Ramgheer sircar, where the moth that yields it is carefully reared, and from whence raw tussah silk is sent to other parts to be woven into cloth. The tussah cloths produced at Madapore are in durability and fineness very inferior to the cloths of the same kind manufactured in Bengal; they are dyed the same colour, and with the same materials as the silks, of which they are about one-half the price. At Madapore there are seventy to eighty families employed in rearing the insect and in the manufacture of the cloth, which is prepared principally for the Hyderabad market. At the Madras Exhibition of 1855, cocoons, from which this description of silk is obtained, were exhibited from several localities. The Saturnia, which is most commonly met with in Southern India, appears to be S. paphia. The caterpillar feeds on the leaves of the country almond tree, Terminalia catappa, whence it is often called the almond moth. It is also found on the leaves of the ber tree, Zizyphus jujuba, the casuarina, &c. The cocoons are ingeniously attached to the twiggy branches of the ber, by a long stalk terminating in a ring, encircling the branch. In the thicker foliage of the casuarina, the silk is woven among the leaves without the above provision. It does not appear that silk in any quantity has been obtained from this source in the Madras Presidency. There, the only use to which the cocoons appear to be turned is that of a ligature for native matchlocks. They are cut spirally into long narrow bands, with which the barrels are tied to the stocks. Considerable quantities of the small silk cloths worn by brahmans at their meals are imported into the Northern Circars from Cuttack. Dr. Roxburgh in the 7th vol. of the Linnean Transactions, described the preparation of the tussah silk of Bengal, derived, there, from two different species of Saturnia. One called *Bughy* by the natives of Beerbhoom, appears to be the same as the Madras species (S. paphia), and is stated to feed on the ber tree and on the asana, Pentaptera glabra. The other, termed jaroo by the natives of the same province, is the S. cynthia, and is domesticated. The caterpillars are fed on the leaves of the castor oil plant (Ricinus), whence it is called the arundy, or arundi silk worm, but it also eats the leaves of the ber and asana. Colonel Sykes, writing in the 3d vol. Trans. Roy. As. Socy. Lond., on the cocoons of S. paphia found by him in the Deckan, under the designation of the kaliswar silk worm, stated that it is met with on the ber tree (Pentaptera glabra), teak tree, and common mulberry. The Chinese tussah is said to be obtained from Saturnia atlas, which is also to be met with in Southern India. Another species of Saturnia (S. selene), the posterior wings of which are prolonged into a tail-like process, is common in Southern India. The caterpillar may be observed feeding in considerable numbers on the Odina wodier, or Be-sharm tree, in February and March. Its chrysalis is enveloped in a silky covering, so like that of S. paphia that it would probably be found to yield a strong and useful thread. It may be worth while to direct attention to the silk spun by several smaller specimens of Bombyx moths, found on different species of Cassia, Acacia and Phyllanthus. A gregarious caterpillar (a species of Lasiocampus) may be observed clustering in great numbers on the stem of the guava, the jamoon (Syzygium jambolanum,) and probably other trees: the silky covering of these also seems deserving of examination. Lieut Colonel F. Cotton sent some of the cocoons gathered by him when exploring the Godavery. The Saturnia genus belongs to the order Lepidoptera and the family Bombycidæ. The antennæ are fringed in the male; the head is small, the wings are very broad and entire; the palpi and trunk are wanting, and some of the largest of the Lepidoptera belong to the genus Saturnia. Saturnia atlas, the Giant Atlas Moth, has wings measuring 7 or 8 inches across. This species also with S. cecropia and S. luna have their wings produced into a tail. The cocoons of S. Cynthia and S. Mylitta are used in India for the production of silk. Latreille states that these are the wild species of silkworm of China. S. Cynthia is the Arrindi

Silk Worm of India (Roxburgh, 'Linn. Trans,' vol. vi.) *Eng. Cyc.* At the Universal Exposition held in Paris in 1855, samples of Indian silk were exhibited with the cocoons of the different species of the Bombycidæ from the Bombyx mori. "pat," Saturnia mylitta, "tussah ;" Saturnia assamensis, "monga"; Attacus cynthia, "eri or eriah." The quantities imported into Liverpool were in four years, as under :

1851.	lbs.	12,000	1854.	lbs.	8,000
1853.	„	2,000	1855.	„	11,000

The tassah silk moth of Ceylon, Antheræa mylitta, *Drury*, feeds on the country almond (Terminalia catappa) and the Palma christi or castor-oil plant.—*Tennent's Sketches of the Nat. Hist. of Ceylon, p.* 427. *Dr. Walker in Madras Journal of Literature and Science. Jury Reports Madras Exhibition of* 1855 *Rhode, MSS. Major Cuth. Davidson, Assistant Resident. TUSSANOON, the sunni mahomedans are so called.

TUSSAWOOF, the theology of the soofee mahomedans or mystics of the east.

TUSSILAGO FARFARA. LINN.

Coltsfoot, ENG. | Watpan, HIND.

This is not uncommon in many places in the Punjab Himalaya, at from 5,000 to 11,000 feet. It grows also in Persia, in chalky soils in England, and is found in many parts of Europe. The plant is mucilaginous and slightly bitter, and may be employed as a demulcent possessed of a little tonic property. Its leaves are sometimes applied to wounds. It may be prescribed in the form of an infusion or decoction one or two ounces to a pint of water.—*Drs. Royle ; O'Shaughnessy ; and J. L. Stewart.*

TUSSOO, a measure of length, 16 of which equal 1 hath or 18 inches.—*Simmonds' Dict.*

TUSTUS. HIND. Viburnum cotinifolium.

TUT, also Tuta, and Tutri. HIND. species of Morus, or mulberry, M. alba, M. lævigata, M. nigra, and M. parviflora. Shah-tut. HIND. Morus alba, &c. Kart tut is the Morus serrata.

TUTA ? TEL. Ipomœa reptans, *Poir.*

TUTACORIN, a town in the Gulf of Manaar, in lat. 8° 48′ N. long. 78° 12′ E.

TUTAM. TEL. White copperas, sulphate of zinc.

TUTELAR DEITIES. See Gramadevata, Hindoo, India, Kula.

TUTENAGUE, or China spelter, is an alloy of iron, copper and zinc. It is harder than zinc, though less so than iron, sonorous, compact, and has some malleability. The fresh fracture is brilliant, but soon tarnishes. Till superseded by spelter from Silesia, it was clandestinely exported in large quantities (more than 50,000 cwt. annually) to India, but is now seldom or never shipped, spelter being, on the contrary, imported to compete with it in China. For boxes, dishes, household utensils, and other similar purposes, tutenague is well adapted. Its export price used to be about 14 dollars a pecul. Another proportion is said to be 8 parts of copper, 3 of nickel, and 6½ of zinc, which gives a fusible alloy, very hard, and not easily rolled, but well adapted for casting.—*Simmond's Dict. Hon'ble Mr. Morrison's Compendious Description.*

TUTI. HIND. Cucumis momordica, also Morus alba.

TUTI KURA. TEL. Ipomœa reptans, *Poir.*

TUTI NAGAM. TAM. TEL. Zinc ; Spelter.

TUTIRI. HIND. Ehretia aspera.

TUTIYA. HIND. PERS. a metallic salt. Nila-tutiya is the sulphate of copper, or blue vitriol. Hira tutiya also called Hira-kasis is the sulphate of iron or green vitriol, Safed tutiya is the sulphate of zinc.

TUTRI. HIND. Species of the Morus or mulberry tree, Morus indica, M. parvifolia, also the wild fruit.

TUTRUM. HIND. Berberis aristata.

TUTTAL.—Six pice.

TUTTHANJANA. SANS. Bluestone ; Sulphate of copper.

Untamol,	HIND.	Kaka pala,	TAM. TEL.
Kodigam,	TAM.	Kukka pala,	,,
Kurinja,	,,	Verri pala,	,,

Grows abundantly in the south of India and in Bengal. Cynanchum ipecacuanha of Willdenow, by many writers, is supposed to be the same as this species. The root is of many, long, thick, whitish, fleshy fibres, issuing from a small woody head. The dried roots of this article afford an excellent substitute for ipecacuanha, if given in rather larger doses. It is said to be valuable in dysentery. This plant yields Koorinja fibre of Tanjore, which affords a good substitute for flax, is of fine quality, white, strong and silky. Untamol, bark of the root of Tylophora asthmatica, must not be confounded with Ununtamul, the root of Hemidesmus Indicus. —*Dr. O'Shaughnessy Beng. Phar. Dr. O'Shaughnessy, Bengal Dispensatory. p.* 445. *M. E. Jr. Rep.*

TYN-ABIAZ. AR. Chalk.

TYPHACEÆ, *DC.*, of plants, the bulrush tribe, including marsh or ditch plants, comprising the two genera Sparganium and Typha known in Sind as Pun and Booree. Of the former, one species occurs in Cashmere, and three species of Typha in India. At Trichinopoly figures and architectural models, are carved in the pith of the Typha. The attitudes of the figures are stiff, but the draperies are characteristic. The figures introduced into the models of the Trichinopoly Fort are usually out of proportion, being far too large for the scale of the buildings. There are pith models of the pagodas of Trichinopoly and Salem, and pith work made from the rushes called "Nultee" in Tanjore, with a model of the pagoda. Cibotium billardieri, (the Dicksonia antarctica of Labillardiere), contains an edible pith or bread fruit eaten by the natives of Australia. Typha bread is prepared in Sind from the pollen of the flowers of the Typha elephantina, and in New Zealand from another species of bulrush, Typha utilis. *Powell. Simmond's Com. Products, p.* 380. *Drs. Voigt. Roxb. and Stewart.*

TYPHA ANGUSTIFOLIA. LINN.

Bulrush, Cat's-tail,	ENG.	Lukh,	TRANS-INDUS.
Reedmace,	,,	Dipa,	PANJAB.
Elephant grass	,,	Dab	,,
Pitz,	KASHMIR.	Kundar,	,,
Yira,	,,	Patira,	,,
Boj,	BEAS.		

This species is common in marshes, &c., in most part of the Punjab plains, at about 4,000 feet in Kullu, and up to the Kashmir valley (5,000 feet); the roots are eaten in Kashmir, and on the Sutlej the lower succulent part of the stem is used for clearing the water of the swollen river, which it does speedily and effectually. In some places, also, they are made into boat ropes, which it is said will last a month, also woven into mats and baskets. In Peshawar, and probably elsewhere, the down of the ripe fruit (not the flower as mentioned by Vigne) is used to bind mortar for wall plaster.—*Dr. J. L. Stewart Panjab Plants. p.* 246. *Powell Hand Book, Vol.* i. *p.* 379.

TYPHA ELEPHANTINA. ROXB. Dib-grass

Elephant grass,	ENG.	Booree,	,,
Putera,	SIND.	Boree,	,,
Reree	,,	Dib,	,,
Pun-	PUNJAB.	Jammu gaddi,	TEL.

This bulrush grows along the river banks and margins of tanks; its leaves called pun, are employed in making mats and baskets in North-west India. The pollen, like Lycopodium, is inflammable, and is *collected* in Sind, and there called Bo[illegible]ree. The term Bori, is, however, also given to a sweatmeat of Dera Ghazi Khan, a curious substance in yellow lumps, consisting of the pollen of the dib grass of the Typha elephantina and of T. angustifolia collected and kneaded together, perhaps with the aid of a little treacle or sugar.—*Powell Handbook vol.* i. *p.* 314.

TYPHON. See Iswara. Purana.

TYPHOON, from Typhon, the north-wind.

Tufau,	ARAB. HIND.	τυφως	GR.
Ti-fau,	CHIN.	Bagui,	PHILIPPINE.
Zephon,	HEB.		

The original meaning of the storm wind, Zephon, is north-wind. Typhoon is the European name of the frightful equinoctial gales which vex sea and land about the tropics in the Eastern Archipelago and down as far as to 10° from the equator. The whole Malayan Archipelago is excluded from their sphere, while the whole of the Philippine is within it, the island of Mindano alone excepted. Typhoon is, however, also said to be a word of Chinese origin, from Ta, great, and Fung, tempest. It may, however, also be from the Arabic Tufan, a storm, and that from the Arabic root Taof, he did turn. Typhoons, cyclones and tornadoes, are great rotatory winds that move along a curved line in increasing circles, sometimes centripetal. In the northern hemisphere, the rotatory movement follows a direction contrary to that of the hands of a clock: while the opposite takes place in the southern hemisphere. In maritime language, Tyfoons are dangerous tempests which occur in the northern part of the China sea, along the southern and eastern coast of China near Formosa, the Basheo Islands, the north end of Luconia: also to the eastward of those islands, and betwixt Formosa and the Japan Archipelago. These tempests usually blow with the greatest fury near the land, as the distance is increased to the southward from the coast of China, their violence generally abates, and they seldom reach beyond lat. 14° N., although a severe gale has been experienced at times two or three degrees further to the southward. They occur in both monsoons. *Horsburgh.* See Hurricane. Winds.

TYPHONIUM ORIXENSE. SCHOTT.

Arum orixense,	*Roxb.*	Arum trilobatum,	*Lour.*
Ghet-kuchoo,	BENG.	Suri-kanda,	TEL.
Ghekool,	TEL.		

Grows throughout the East Indies, common in the shady mango-groves near Samulcotta, and where the soil is dry and fertile. The other species are T. divaricatum, T. flagelliforme, T. sylvaticum, and T. trilobatum. T. orixense is exceedingly acrid. The root of T. flagelliforme (Ghas-kuchoo) is boiled in milk and the milk given in consumption. The roots of T. orixense are used in poultices as a counterirritant. The tubers are exceedingly acrid while fresh, and are used as an application in snake-bites. They are likewise given internally in doses of from 20 to 30 grains. Roxburgh describes this Arum as a most powerful stimulant in proper hands. A poultice of Orissa arum, Ghet-kuchoo, bruised to pulp with tepid water, is a stimulant rubefacient and counter-irritant, applied to indolent buboes and tumors by the native practitioners and with frequent advantage.—*Voigt. O'Shaughnessy Bengal Dispensatory. Beng. Phar. p.* 390. *Simmonds.*

TYPHONIUM SYLVATICUM. SCHOTT.

Arum sylvaticum,	*Roxb.*	Amorphophallus sylvaticus.
Adavi chama,	TEL.	

TYRE. According to Justin, the ancient city of Tyre, the most celebrated of the cities of Phœnicia, and once the emporium of the world, was founded by a colony of Sidonians, who fled thither when the king of Askalon captured their city, and the date of its foundation was the year before the sack of Troy. The prophet Isaiah calls her "the daughter of Sidon." "Tradunt historiæ," says St. Jerome, "quod Tyrus colonia, Sidonis sit." But the first year of New Island Tyre was 1254 B. C. Its total destruction, which had been foretold by the prophets with extreme minuteness, was effected by the Assyrians under Nebuchadnezzar 573 B. C. after thirteen years' siege, one of the longest recorded in history. The fall of insular Tyre has been no less remarkable. Alexander the Great had already made himself master of the whole of Syria and a part of Phœnicia, whilst Tyre (the insular town) still offered an obstinate resistance to his victorious arms. Irritated by several unsuccessful attempts to storm it by sea, he conceived the bold design of filling up the channel which separated it from the continent. This was effected by sinking piles into the sea, and throwing into the intervening space immense blocks of stone. The ruins of the ancient city afforded ready materials for the purpose. The whole was covered with sand. It was only after seven months' close siege, that the inhabitants, attacked simultaneously by sea and by land, and the town being set on fire, surrendered to the Macedonian chief. When Tyre fell into the hands of Alexander (before Christ 332, and about 260 after the time of Ezekiel), that city was in full possession of the Indian commerce. It recovered its commercial importance, and was a flourishind city under the successors of Alexander. Nor did it cease with the Roman conquest: the emperor Hadrian repaired the fortifications, and made it the metropolis of a province, giving it all the advantages of a Roman colony. From the dominion of Rome it subsequently fell into the hands of the Saracens, about A. D. 639, who remained a long while in possession of it. It was taken by the crusaders in 1124, after five months' siege, but they were forced to surrender it in their turn to the Mamelukes of Egypt in 1289. Frederick the First, surnamed Barbarossa, who died in the year 1190, was interred here. Tyre was the birthplace and residence of many persons celebrated in history. Hiram, one of its kings, was the friend of David and Solomon. He contributed to the construction of the great temple. The place is now known to the natives by its ancient Hebrew name of Tsur, corrupted by the Greeks into Tyrus, and by the Romans into Serra.—*Robinson's Travels, Palestine and Syria, vol.* i. *p.* 269.

TZAZEGA. The capital of Hamazen in Abyssinia, said by Heuglin to contain from 1,500 to 2,000 inhabitats. Abbiaddy is the capital of Tembeen in Abyssinia. Mr. Dufton says that the place is mahomedan, and has an occasional market, and that, when he entered it, about 2,000 people were assembled in the market place.

TZEREMISH are the original inhabitants of the provinces of Cazan and O-se-ta-our-han. After the Russians had made themselves masters of all these places, this people still continued to occupy the country to the left of Cazan, and they have now been in subjection to the Russians for many years. They resemble the Tartars in their external appearance, and they also wear their hair short, but their language is totally distinct, and they spring from a different origin.—*Staunton's Narrative p.* 126.

TZERI. HEB. Balm. Melissa officinalis.

TZE-TU——? See Rose wood.

UMA. A name of the hindu goddess Parvati, the female energy of Siva. Under this name the goddess was surprised by the rishis in the forest of Gauri, in the embraces of Siva; in consequence of which, that deity condemned every male who should, from that period, enter the forest, to a change of sex. This story has been also attributed to Rohini, the wife of Soma or Chandra, who surprised her in a similar situation with Siva, who accordingly transformed the unfortunate husband into a female. Hence, Soma or Chandra, the moon, which was before of the male, became of the female sex.—*Cole. Myth. Hind. p.* 398. See Tantra.

UMA ATASI. Sans. Linseed.

UMAM-PATCHE-ARISI. Euphorbia pilulifera ?

UMANA. Maleal. Thorn-apple, Datura species. Nella umata, Maleal. Datura fastuosa, *Mill, Roxb.*

UMAR, the second khalif after Mahomed, Mahomed's successors having according to the sect of sunni mahomedans, been Abubakar, Umar and Ali. It is Umar of whom the statement is made that he ordered the Alexandrian library to be burned. He was assassinated at Jerusalem, where his tomb is still shown. See Khalif.

UMAR DAS. See Sikh.

UMBALLA, in L. 30° 21·4′ N.; L. 476° 48′ 8″ E. in the Panjab, a large military station 1,026 feet about the sea.—*Schl. Herm.*

UMBAR. Tam. Amber, properly Ambar.

UMBARI, in Bombay, fibres of Crotalaria juncea.

UMBARI-KI-BHAJI. Duk. Hibiscus cannabinus, used as greens.

UMBER. an ore of iron and manganese, employed as a brown pigment.

UMBER. Hind. Duk. Ambergris.

UMBELLIFERÆ. Juss. the Apiaceæ of Lindley, the Celery tribe of plants, natives of the northern hemisphere, upwards of a hundred species of which occur in the mountains and plains of India, viz:—

Hydrocotyle	8	Trachydium	1	Pimpinella	3
Helosciadum	4	Athamanta	3	Bupleurum	11
Ptychotis	5	Selinum	5	Fœniculum	1
Prangos	1	Palimbia	1	Eriocyla	1
Sison	3	Peucedanum	3	Cnidium	1
Vicatia	1	Anethum	1	Hymenidium	2
Carum	2	Torilis	1	Ligusticum	3
Sium	1	Chærophyllum	4	Archangelica	1
Oenanthe	2			Cortia	1
Dasyloma	3	Pycnocycla	1	Pastinaca	2
Pleurospermum	1	Sanicula	1	Heracleum	8
		Laserpetium	2	Tordyliopsis	1
Seseli	1	Falcaria	1	Osmorrhiza	1
Hymenolæna	9	Ammi	2	Ozodia	1

Some species abound in resins, containing a large quantity of an essential aromatic oil, and act as aromatics and stimulants; others yield fetid gum resins.—*Voigt, p.* 19.

UMBRELLA, a genus of the mollusca.

UMBRELLA.

Payong,	Burm.	Songsong, Paying, Bawat,	Jav.
Kettisol (paper umbrellas,)	Chin.	Payuug,	Malay.
Parapluie,	Fr.	Kodayal,	Tam.
Chatri,	Guz. Hind.	Godugulu,	Tel.

Umbrellas are employed as a shade against the heat of the sun and rain; a smaller kind, the parasol, being used chiefly by ladies, either while walking, or riding in open conveyances. The kettisol, or paper summer head, is extensively manufactured in China, whence it is largely exported to various parts of the world. In India, palm leaves spread over bamboos are largely used. The umbrella of the Lepcha in Sikkim consists of a frame work of bamboo enclosing broad leaves of Phrynium. In many Eastern countries, the right to use an umbrella is bestowed by sovereigns; until recently, no native of India would have presumed to keep his umbrella spread, or his slippers on, while approaching a European, nor pass a European sentry with it. Those bestowed by sovereigns, are of various shapes and have various names. To use an umbrella at all, amongst Malays, or rather to have it carried over one, for no native carries an umbrella himself, is a mark of rank, and its quality implies the degree of that rank. The sovereign alone uses one which is gilt throughout. In Java, a small umbrella, called a "bawat," is the special badge of the higher nobility, called by the Sanscrit title of bopati. This is not made use of to from sun or rain, but carried by a retainer before the party.—*Hooker vol. I,* 131. *Crawfurd Dict. p.* 442. *Faulkner.*

UMBRELLA-TREE, a name applied to the Acacia planifrons, which grows straight and then spreads its branches horizontally: a few of these are growing [illegible] the cantonment of Bellary; the name is also applied to the Pandanus odoratissimus, which throws down aerial roots.

UMBRIAN. See India.

UMBRINA RUSSELLI, Cuv. & Val. Isinglass is obtained from this fish. See Fish. Isinglass.

UMBU. Hind. Myricaria elegans, and M. Germanica, also Carum carui.

UMBURATI NAR. Maleal. Fibre of Terminalia belerica.

UMBUTI. Duk. Hind. Oxalis corniculata, *Linn.*

UMBUTI KI BHAJI. Duk. Oxalis corniculata; its greens.

UMBRIDÆ, a family of fishes.

UMHSEE. See Kush.

Funis uncatus.			
Japan-Earth,	Eng.	Gambir.	Malay.
Terra Japonica,	,,	Unkoodoo.	Tel.

One of a genus of plants belonging to the natural order Rubiaceæ, a native of Penang, Sumatra, Malacca, and Ceylon near Colombo, at an elevation of 3000 feet, and quite a common plant near Colombo, Galle, Deltotte and Doombera. The extract from the leaves is called Gambier, and is manufactured from the leaves in Siak, Malacca, and Bitang. After inspissating by decoction, it is strained, suffered to cool and harden, and then cut into cakes of sizes, or formed into balls. A gambier plantation has much the appearance of brushwood of three years' growth, with leaves of a dark green colour. The leaves are collected three or four times a year, and boiled in a cauldron, from which a strong decoction is poured into square boxes, which when cool, hardens, and is cut into small cubes of about 1½ inches. As brought to the market, it resembles in appearance and consistency little square blocks of yellow mud, hence one of its names, Japan earth. The plant, which is small and bushy, seldom over seven or eight feet high, is much cultivated at Singapore, and is planted six feet asunder; the leaves are small, smooth, and of a dark green colour. The cropping of the leaves may commence when about eighteen months old, but the plant is at its full growth when two years old, and its leaves and young branches may then be cropped once in two months. The croppings are thrown into a large cauldron of hot water and boiled for six or seven hours, till all the extract be inspissated into a thick pasty fluid. This is now poured into shallow troughs a little more than an inch deep, and allowed to cool and dry, when it is cut up into little inch blocks, and is then ready for the market of Siam, Cochin-China, China and the Archipelago, where, along with betel-nut, in a leaf of the Piper betel (Siri), it is largely chewed as a masticatory, as natives of India use the betel-nut of the Areca catechu. The average size of the Singapore plantations are of thirty acres, and when in full bearing employ eight men. A plantation becomes exhausted and worn out in 15 years from its commencement. A composition of this extract is valuable as a preservative for timber. Dissolve three parts of gambier in twelve of dammer oil, over a slow fire. Then stir in one part of lime, sprinkling over the top, to prevent its coagulating and settling in a mass at the bottom. It must be well and quickly stirred. It should then be taken out of the cauldron and ground down like paint on a muller till it is smooth, and afterwards returned to the pot and heated. A little oil should be added to make it tractable, and the composition can then be laid over the material with a common brush. As a protection against the teredo, black varnish or tar are substituted for dammer oil, omitting the grinding down, which would not answer with tar. Gambier is largely imported into Britain, and it is used in tanning. From 1846 to 1850, the average quantity entered was 1,200 tons, priced at £13 to £14 the ton. It is duty free. —*Thw. En. Pl. Zeyl. p.* 133. *Ainslie's. Mat. Med. p.* 264. *O'Shaughnessy, Beng. Dispens. p.* 398. *Crawfurd's Dictionary p.* 142. *Journ. Indian Archipelago. Simmonds. Poole's Statistics of Commerce.*

UNDA. Hind. An egg.

UNDI. Duk. Mar. Calophyllum inophyllum.

UNDI-MARA. Can. Goolumb. Mahr. Samus. Two large and straight trees bear this name. They are abundant in the southern ghat jungles above the Canara and Sunda forests, but mostly in situations too remote from water for the wood merchant. Wood good, as it abounds in an aromatic oil, which preserves it from insects.—*Dr. Gibson.*

UNHILWARA, a town in Kattyawar.

UNICORN. The unicorn of Tibet, an animal which has been described by Messrs. Huc and Gabet, who travelled in Eastern Tibet, It is one of the Ungulata. When Hermann Schlagentweit was in Nepal, he procured specimens of horns of a wild sheep (not an antelope) of a very curious appearance. At first sight it seemed to have but one horn placed on the centre of the head; but on closer examination, and after having made a horizontal section of the horn, it was found to consist of two distinct parts, which were included in a horny envelope, not unlike to two fingers put in one finger of a glove. The animal, when young, has two separate horns, which are however placed so close to each other, that the anterior borders begin very soon to touch: later, by a slight consequent irritation, the horny matter forms one uninterrupted mass, and the two horns are surrounded by this horny substance, so that they appear at first sight to be but one.—*Herm. Schlag.*

UNIWATTA. JAP. Sponge.

UNJUN. HIND. Lamp black: also the term for one of the sorceries of the mahomedans in India, in which the diviner applies lamp black to the palm of a child or adult, and bids him stare well at it, and the person then divines. The Urt'h-anjan is used to discover stolen property; the *Bhoot-anjan* for ascertaining the state of the sick; the

Dhanna-anjan, to discover hidden-treasure; the Sarwa-anjan, for all purposes; and the Alope-anjan, applied to the eyes or forehead of a person, renders him, wherever he be, invisible to others, while they remain visible to him.

UNJUN HIND. Antimony.

UNKOODOO. TEL. Uncaria gambir.

UNKOTHA. SANS. Alangium hexapetalum.

. UNNAB. HIND. Zizyphus jujuba.

UNNUD-BUHSEEN. See Khutri.

UNONA. A genus of plants belonging to the natural order Anonaceæ, of which about 23 species are known to occur in south-eastern Asia. U. longifolia of Sylhet is an elegant tree, with smooth, pointed, and undulate leaves, which is much cultivated in some parts of India to form avenues and to afford shade. It is sometimes called 'Deodara', which is properly the name of the celebrated Himalayan pine, Cedrus deodara; it has large orange yellow flowers. U. tripetala, U. uncinata, are natives of the Indian islands U. sylvatica is said to be valuable for its timber.—*Voigt. Eng. Cyc.*

UNONA DISCOLOR. VAHL.

Uvaria monolifera, *Gœrtn.*

Ata-maram,	TAM.	Chilka-duduga,	TEL.

A tree of the Circars, Chittagong, Tavoy and Penang, with large yellow flowers. It is a pretty large tree, and a native of mountainous parts of the Northern Circars and of Chittagong. The wood is employed for various economical purposes, but chiefly for rafters.—*Roxb. Voigt. Rhode MSS.*

UPANGA. Of these holy books of the hindus, there are four:

Purana, or History, comprising the 18 Puranas.
Nyaya, Logic, and the principles of knowledge.
Mimansa, Religious Principles and duties.
Dharma Shastra, Law, human and divine.

See Vidaya.

UPANAYNA, is the investiture with the sacred cord. The cord is called upavita. When five years old, the father fixes on an auspicious day, and entrusts his son to a teacher. The instructor writes the alphabet, or rather engraves it with an iron style, sometimes set in silver or gold, on a leaf of the palmyra tree, which is then coloured with turmeric. The leaf is placed on unhusked rice spread over the floor, and the teacher, whatever the sect or caste of the pupil be, invokes the god "Vigneswara" to smooth the difficulties in the way of the child's studies. Then, holding the boy's fore-finger, he thrice traces with it the forms of the vowels in the rice, teaching the boy their sounds. The pedagogue is presented with a new cloth and some money, and dismissed, after which relatives and friends are entertained. On the seventh or ninth year, the "Upanayanam" is performed, on which occasion the family priest 'Upa-d'hayya' Sanscrit, Upadhialu, Tel., causes the boy to offer a burnt-offering or "Homam" to the entire pantheon of gods, by pouring ghee (clarified butter) over the fire. He then invests the youth with the zandiyam, the zonar or sacred cord, letting it fall from over the left shoulder to the right side. He subsequently teaches the Gayatri to the boy, if he be of the brahminical order, as also the morning, noontide, and evening prayers, the due attention to which is considered sufficient to remove all sins committed during the day and night. The Gayatri or Gayatri-mantrum of the brahminical or priestly order, is never pronounced aloud—and it is exceedingly rare that any brahman can be induced to divulge it. Its literal translation is "Om ! earth, air, heaven, Om ! Let us meditate on the supreme splendour of the divine sun ; may he illuminate our minds." It is considered the most venerable text of the Vedas, and the common belief in and reverence for, it, is the bond of union amongst the entire priestly order. With this ceremony, the boy is considered to be born again, and he is of the Punar Janma or twice born. This is the spiritual birth of the hindu, or his regeneration, for until this time the uninitiated youth, though of the brahminical class, is only, so far as his right to perform religious ceremonies is concerned, regarded in the light of a sudra. If the youth who has now been initiated into the mysteries of the brahminical order, be set apart for the sacerdotal office of the priesthood, he is further marked on the muscular part of both arms by being branded with sanku, or chank, and chikram, or disc of Vishnu. This is called the "chakrankitam." From this time, however, he is ranked as a bramhachari, or of the order of bachelors, for he has now entered on his religious life, the whole of the days of a spiritual brahman being apportioned into four religious stages, viz., that of the Bramha-charyam or bachelor-hood ; Grahastasramam or the married state ; Vanaprastam, the living in solitude with his family ; and Sannyasam, or the abandonment of all worldly matters. A bachelor's dress differs from that of a married man in so far as he does not wear the dhoti, but only a wrapper round the lower part of the body : he is prohibited from eating betel, and continence is enjoined. Among other hindu castes, the bram'hachari ceremony is performed at any time prior to the celebration of marriage, but their Gayatri, is from the Puranas, not the Vedas.—*Wilson.*

UPANISHAD. A class of sacred books belonging to the hindus, containing doctrines of the Vedas explained and enlarged according to the Vedanta. They are the best books after that school. Their theology is monotheistic, a pure theism, and Brahm, in the neuter gender, is used for the deity ; the dogma of one Supreme Being, detached from matter, maya or sacred. The Upanishad, therefore, may be described as treatises on the unity of God and the identity of spirit. Some of the shortest have been translated into English by Ram Mohun Roy, Dr. Carey, and Sir W. Jones. They were also rendered into Persian by order of Dara Shekoh, the son of Shah Jehan, and were thence rendered into Latin by Anquetil du Perron, a summary of whose works in the French has been published by Mons. Lanjuinais. The whole number of Upanishad known at present is 138, of which only eleven have been published. According to the theory laid down in the Mahavakya Ratnavali, there are 1180 Upanishad, equal to the number of Vedaic schools, one Upanishad belonging to each school. This theory, however, is fanciful. According to the received definition, the Upanishad are such parts of the Vedas as embody their metaphysical and theological views, which may be compressed into the formula that the finite soul is essentially the same with the infinite spirit or Brahma, and though the various Upanishad widely differ from each other, all maintain this identity of the finite and infinite spirit. Dr. Weber arranges the Upanishad into—(1) those which belong to the three first Vedas, as forming the Vedanta system ; (2) those comprising all the Atharva Upanishad, and referring to the Vedanta system in its entire development ; (3) the Upanishad in which the meditation has become crystalised and is limited to the mystical word "Aum" ; (4) those treating on the order of the "Sunyasi" ; and (5) the last division, which includes the sectarian Upanishad, in which the Atman is worshipped as an independent deity.—*Thomas Prinsep's Antiquities. Taylor. Hind. Th. vol. 2. p.* 13. See Vidya, Veda, Arian.

UPARAJITA. Beng. Hind. also Uparajita Asphota. Sans. Clitoria ternatea, *Linn. Roxb.* From a, and parajita, to conquer.

UPARINTA. Tel. Cardiospermum halicacabum.

UPARNA. Sans. From a and para, leaves.

UPASAMPADA, the rite of ordination into the buddhist priesthood.

UPAS, in Javanese, poison, or venom, is the term applied to the sap of some plants of the Malay and Philippine Islands yielding poisonous juices, which, by concentration, produce a poison of considerable activity, and is sometimes employed by the ruder natives to render their weapons deadly. The most potent of these plants in Java are the Anchar, the Antiaris toxicaria, a large forest tree, and the Chetek, Strychnos tiente, a climbing shrub. In all these cases, the poison, even when fresh, is far less active than that of the cobra snake, for the most powerful will take an hour to kill a dog, which the venom of the hooded snake would certainly accomplish in half the time. To effect a fatal purpose, too, it is necessary that the poisoned weapon should be left in the wound, and not withdrawn, so that the probability is that few human beings have ever lost their lives by means of these poisons.—*Crawfurd Dictionary, page* 442. *O'Shaughnessy, page* 579.

UPAS ANTIAR. The Upas tree.

Antiaris toxicaria, *Lesch.*		Ipo toxicaria,	*Pers.*
Upas tree,	Eng.	Anchar,	Malay.

A native of Java, where it grows in the forests often over a hundred feet in height. It is the Upas tree of Java, anchar of the Malays, is the Ipo toxicaria of Persoon, the Antiaris toxicaria of Leschenault. It was first described by Mr. Foersch, a surgeon of the Dutch E. I. Co., in vol. iv. of Pennant's Outlines of the Globe, and was then reprinted in the London Magazine for September 1785. Dr. Darwin celebrated it in poetry, where he says,

> "Fierce in dread silence, on the blasted heath,
> Fell upas sits, the hydra-tree of death."

It is known in story as that tree under whose shadow none could exist, while its juice forms the well known upas antiar poison, the anchar of the Malays, with which the Javanese tip their little poisoned arrows. Dr. O'Shaughnessy mentions that the tree grows in Java in a valley filled with carbonic acid, into which it is therefore highly dangerous to descend, and he supposes that this probably originated the stories as to the deadly influence of the tree. The tree itself is often over 100 feet in height, its bark pale, smooth, its leaves oval, coriaceous, hairy. The poison is prepared by mixing the gummy resin (into which the bitter viscous juice concretes) with the seed of the Capsicum frutescens and various other aromatics. This poison at first acts as a purgative emetic, then as a narcotic, causing death by violent fits of tetanic convulsions. The Upas tiente poison of Java is different, being prepared from the juice of the Chetek, Strychnos tiente, a climbing shrub. Noxious as this poison is, it is, when fresh, far less active than that of the cobra snake, as the most powerful will take an hour to kill a dog, which the venom of the hooded snake would certainly accomplish in half the time. To effect a fatal purpose too, it is necessary that the poisoned weapon should be left in the wound and not withdrawn, so that probably but few human beings have lost their lives by means of this poison. The arrows are small and slight, and are discharged with accuracy from the sumpeton or blow-pipe, by the mouth.—*Voigt. O'Shaughnessy, p.* 579. *Crawfurd Dictionary, p.* 442. *Eng. Cyclop. Wathen's Voyage, p.* 165.

UPARAVARA. Tel. Tam. A labouring race in the south of India, the men erect walls and make mortar with mud for building; the women bring wet mud, mortar, stones, and bricks, mix and grind mortar. Men's implements are the guddapara or crowbar, the mamotee, phaora, or hoe; women make baskets and tattoo figures on the arms of hindoo women. See Uperawandlu.

UPASHA. See Vidya.

UPASRA. Schools or colleges of the Yati or Jain teachers.

UPATISSO. See Mahomedanism.

UPATRI KARANA. Sans. From a, and patra, a worthy person, and kree, to do.

UPA-VEDA. Of these religious books of the hindoos, there are four, the Ayush, Medicine; Gandharva, Music; the Dhanush, Warfare; and the Sthapatya, Mechanics. The third Upa-veda was composed by Viswamitra, and treats of the fabrication and use of arms and implements handled in war by the Chatriya tribe.—*Thomas' Prinsep.* See Veda, Vidya, Pritivi, Mahabharata.

UPA-VIT. Sans. The thread or cord worn by the three classes of hindus over the left shoulder and under the right arm, and worn also by the five Kansala or artizan races. It is called Zandiam in Telugoo and Punal in Tamil. See Hindoo; Jandiam; Dwaita; Upanainam; Zandyam.

UPAUN——? Tabernæmontana coronaria. See Tugar.

UPEI. Malay. The outer envelop of the stem of the pinang or Areca catechu palm, below the bunches of fruit. It is used in the Archipelago for making sifters (timba), for packing goods, making torches, &c.

UPENDRA. See Inscriptions.

UPERA WANDLU. Tel. Dravidian people, who, along with the Wadra-wandlu, or Waddar race, are employed in digging tanks, salt-making, and road-making. See Upara-vara.

UPI, or Oodapi. See India.

UPLA, also Upli. Hind. Cakes of dried cow-dung used as fuel.

UPLAND GEORGIA, or Short stapled cotton. See Cotton.

UPO'DAKI. Sans. Basella cordifolia *Lam.* B. alba, *Linn.*; *Rheede*; *Roxb.*

UPOOR. A tree in Beluchistan, supposed to be the Zizyphus jujuba.

UPPARINTA. Tel. Cardiospermum halicacabum, *Linn.*

UPPER ASSAM. The upper part of the valley of the Brahmaputra river. See Assam, India.

UPPER INDIA, a name applied to modern Hindustan.

UPPER MOMUND. Afghanistan. See Kabul, Khyber, Momund.

UPPER NILE, the upper part of the river Nile. See Kush.

UPPER NOBLE, is the translation of the word Aryan. See Aryan. Hindu.

UPPER PITI. See India.

UPPER SELENGA. See Kalka.

UPPER SIND. See Kelat, Kurrachee.

UPPER TIBET. See Tibet.

UPPI-CHETTU. Tel. Capparis sepiara, *Linn.*

UPOORVATA. Sans. From a, priv. and poorva, unprecedented.

UP-PATI. Sans. From ap, water, and pati, a lord.

UPPU. Tam. Salt.

UPPU PONNA, also Adavi-ponna. Tel. Rhizophora mucronata, *Lam.*

UPPURAN. See Vidya.

UPPU SANAGA. Tel. Cressa Indica, *Retz.*, so called from frequenting salt lands near the sea, where it has much the look of young chenna, the Cicer arietinum, or Bengal gram.

UPPUTAH, the Malayala name of a Malabar wood, which is hard, strong and heavy. It grows to about twelve feet high, and ten inches in diameter. It is used by the native carpenters for the frames of boats, of coasting-vessels, and similar purposes, where strength is required.—*Edye, Forests of Malabar and Canara.*

UPRADHANA. Sans. From a, priv. and pradhana, chief.

UPSARA. Sans. From ap, water, and sree, to go.—*Ward.*

UPSALA. See Basant. Sacrifice.

UPSARASA. See Apsarasa. Sati.

UPUCUTI, a bush common in Malabar; it contains a very tenacious juice, which is used for sealing letters.—*Ans. Mat. Med. page* 204.

UPU-DALA. Hort. Mal. Ruellia ringens.

UPU-NAINAM. Sans. literally the added eye, the second birth of the hindus, on the assumption of the sacred string, the Zandiam in Tel, Punal, Tam. See Upa-vit.

UPUPA EPOPS. Linn. Upupa Indica, *Hodgs.*

Hoopoe,	Eng.	Hudhud,	Hind.
Εποψ; Epops,	Gr. Lat.	Kat-kuto,	Sind.

The 'Hoopoe,' of Europe, Asia and Africa, is a common winter-visitant in Lower Bengal, but is generally replaced by a nearly affined race in upper Hindustan and south India. This bird was often alluded to by Greek and Latin authors, and Ovid makes Tereus be transformed into it. It belongs to the Upupidæ, a family of Insessorial or perching birds. Its long crest of parallel rows of white, yellowish, brown and black feathers, is frequently erected, and when seen flitting in a dense forest, it looks a very handsome bird. It is easily domesticated and flits about a room. Its long curved bill enables it to search for worms in the ground. It builds in holes in old walls. It is common in southern Asia during the cold season, and on the table-lands at all seasons, and is, to all appearance, a bird of fluttering and feeble flight, but it has repeatedly been observed, during its seasons of migration, at altitudes considerably above the limits of vegetation. On the western side of the Lanak pass, about 16,500 feet, I saw a hoopoe, writes Major Cunningham, and at Momay (14,000 to 15,000 feet elevation), under the lofty Donkia Pass in Northern Sikhim, in the month of September, Dr. J. D. Hooker observed, "birds flock to the grass about Momay; larks, finches, warblers, abundance of sparrows (feeding on the yak droppings), with occasionally the hoopoe: and waders, cormorants, and wild ducks, were sometimes seen in the streams, but most of them were migrating south."—*Dr. J. D. Hooker, Himm. Journ. Cunningham's Ladak.*

UPUPA NIGRIPENNIS. Gould.

U. Minor,	*Sykes, Jerdon.*	U. Senegalensis,	*Blyth.*
Hudhud,	Hind.	Kondah pitta,	Tel.
Kukudeu guwa,	Tel.	Indian Hoopoe	

The Indian hoopoe is found throughout India: it builds in old walls and eats insects.

UPURAJITA. Beng. Hind., also Kowatiti. Hind. Clitoria ternatea. The word is Sans. from a, and parajita, to conquer.—*Ward.*

UPWA. Hind. Avena fatua.

UQEEQA. Arab. A sacrificial rite amongst the Arab mahomedans, consisting of an offering to God on the chutthee or chillah, the fortieth day after delivery, of one, if a girl, or two he-goats, if a boy.—*Herk.*

UQIQ. Hind. Cornelian, written Akeek.

UQIQ UL-BAHAR. Hind. Mocha stone.

UQQALL-BAHAR. Canna Indica, *Linn.*

UR, of the Chaldees, lies between the eastern confluents of the Chaboras and Tigris. The tract of country first occupied by the Chaldeans was the mountainous district of the Chasdim, or Chalybes, in Central Armenia, a little way northward of Erz-Rum. We also find traces of this people in the names given to different places at intervals westward of the source of the Euphrates, as far as the banks of the Halys, and likewise in Babylonia, a part of which, together with the whole tract of country lying between the rivers, was designated Chaldea by some of the oldest writers, and more particularly by Berosus, who speaks of a great resort in Babylon of the people inhabiting Chaldea.

Strabo speaks of the Chalybes, Mosynœci, &c., and mentions that the former were then called Chaldeans. (*Strabo,* xi. pp. 528, 529.) This people, or rather the Sabean followers of Cash, are to be distinguished from those descendants of Shem who, at a later period, occupied part of the mountains of Assyria and the country westward of the river Tigris, and to whom, though perhaps erroneously, the Chaldean name has been more particularly applied. The earlier kings of Babylonia are designated Chaldeans—(See *Fragments from Apollodorus, Syncellus, and others,* pp. 30, 56, 67.) In Ptolemy's time, the name Chaldea was evidently applied to a tract of country touching the south-western extremity of old Babylonia, and extending from thence to the Persian Gulf along both sides of the Shatt-ul-Arab, and therefore including some of the territory lying eastward of Ur of the Chaldees. In this section of the country, Ptolemy places the towns and cities of Shunda, Rahacharta, Shalata, Atha, and Teredon, all on or near the river, whilst inwards from thence were situated Chumara, Bethara, Beramba, and Orchoe. Instead of these places we now find the modern city of Basrah and the towns of Diwaniyeh, Imam-Ali, Lamlum, Semavah, Kut, Suk-el-Shuyukh, Mujayah, Kurnah, Girdelan, Zabeid, Mohammarah. Waist, and Kut-el-Amarah. Having briefly noticed the changing limits of Chaldea, it will be seen that the Cusbdim territory before mentioned (the Armeno-Chalybes of Pliny) formed but a small part. The Chaldeans, and their neighbours the Tibareni, were subject to Armenia. Abraham was born in Ur of the Chaldees B.C. 2927, and in 2900 went to the south-western part of Mesopotamia with his father, immigrating B.C. 2877 into Canaan.—*Bunsen, Strabo,* xii. *p.* 555, *quoted by Col. Chesney, p.* 92. See Abraham, Terah.

URA. Tel. belonging to a village.

URA CREPITANS. Its elastic capsule bursts, and disperses its seeds, with a sharp report.

URAD. Hind. Phaseolus radiatus, also P. Roxburghii.

URA KAKARA. Tel. Momordica charantia, *Linn.*

URA KANDA, also Pati kanda. Tel. Arum campanulatum, syn. of Amorphophallus campanulatus, *Roxb.*

URALI, a branch of the Irular race on the Neilgherries. See Erular ; Kurumbar ; India.

URA NAKKERA, also Nakkera. Tel. Ximenia Americana, *Linn.* The fruit resembles in flavour the peach, as does the kernel of the nut. The leaves also smell like the common laurel, and probably contain prussic acid. In Masulipatam and Guntur the ryots distinguish two kinds, this and a small stunted variety which grows in their fields, and which they say never attains a larger size. They use the bark medicinally for their cattle.

URAN. Hind. Cæsalpinia sepiaria.

URANIA GUIANENSIS. One of the Musaceæ. See Dyes.

URANIA SPECIOSA. Tr.

Handsome Urania, Eng.	Traveller's tree, Eng.
Ravenala, Madagascar.	Plantain-leafed Palm ,,

This elegant tree, a native of Madagascar, is cultivated in India for ornament, and is to be seen in the Dekhan, in Madras, in Singapore, in Penang and Tenasserim. Its short solid trunk resembles that of the palm tribe, but its leaves those of the plantain. It is well worthy of being cultivated, and in a border, or at the end of a walk, when growing, it forms a perfect screen. It bears a small fruit like the drupe of a plantain, which is of a bluish colour. The juice of this plant has the property of rendering water or milk, either hot or cold, mucilaginous, without altering the taste, colour, or smell of the liquid in its former state. Butter-milk and water is often thickened with the juice of this plant, and then sold as an unadulterated article of the richest and best description. It is propagated by seed and suckers, and fifteen feet space should be allowed between each tree. Its banana like leaves spring in a beautifully imbricated fashion, from the two opposite sides only of the stem, the whole tree spreading its leaves out and forming a semi-circular head representing a gigantic open fan.—*Roxburgh. Collingwood. Riddell. Mason.*

URANKI GADDA. Tel. Poa nutans, *Retz.*

URANUS. See Hindu.

URAON is alike the name and the language of the Urya people; it is an uncultivated idiom, and contains many roots and forms belonging to the Kol dialects, and so many Dravidian roots of primary importance, that it is considered by Dr. Caldwell as having originally been a member of the Dravidian family of languages. The Uraon, according to their own traditions, were driven across the Sone by the intrusion into their native land of Gangetic hindus, and ultimately settled in Chota Nagpur, the country of the Kol tribe of Munda or Ho. At a later period, hindus spread into this territory, reduced the more civilized Uraon to slavery, drove the wilder Kol into revolt, and eventually forced them to migrate to the southward and eastward into the land of the Bhuian. The more northerly of the eastern emigrants passed out into the low country, and mixing with the Bhumij and Bhuian natives, formed the class of Tamaria. The more southerly moved into Singbhum and Kolehan, living at peace with the Bhuian pre-occupants, until the intrusion of hindus from Marwar, who first leagued with the Bhuian against the Kol and then with the Kol against the Bhuian, and finally appropriated Singbhum, leaving Kolehan or Ho-desham to the Kol or Ho, as the southern tribe call themselves. Remnants of the Kol are still found to the northward in Chota Nagpur, and they appear to be also spread to the northwards towards Rajmahal. The nomadic Sonthal tribe appear to be very widely spread. It is found in Chota Nagpur and in the skirts and valleys of the Rajmahal hills ; it is enumerated by Mr. Stirling in his list of the tribes of Cuttack, and according to Captain Sherwell, its range is from Cuttack through Chota Nagpur to Rewa, thus embracing the territory of both divisions of the eastern Vindyan races.

The Uraon and the Male or Rajmahali dialects are still closer to the Gond and south Dravidian than the proper Kol. The Male and Uraon languages are mainly Dravidian, and it is remarkable that although the Male are now confined to the N. E. extremity of the Vindhya, where the Ganges washes and bends round the chain, and are separated from the south Dravidian nations by the Kol, their language is more Dravidian than the Kol itself. The explanation is probably to be found in the circumstance of the Uraon and Male having originally formed an uninterrupted extension of the Gond tribes and dialects that extended from the Godavery to the north extremity of the Vindhya. Physically the Kol and Male-Uraon are Ultra-Indian more than Dravidian, and the occupation of the Eastern Vindhya and hills on the opposite side of the Gangetic valley, by Ultra-Indians, implies that the valley itself was at one time possessed by the same race,—the simplest conclusion is that the Kol were an extension of the ancient Ultra-Indo-Dravidian population of the lower Ganges, and of the highlands on its eastern margin. The Ho language differs so little in phonology and glossary from the Munda, Bhumij and Sonthal, that Captain Tickell's account of its grammar may be taken as that of the Kol language generally.

AThe Khond language of Gumsur appears to be merely a dialect of the Gond.—*Col. Dalton. Mr. Logan in Jl In. Arch.* See India. Kol.

URATMANIS. MAL. Liquorice root.

URAVADA CHETTU. TEL. Bruguiera parviflora, *W. & A.*, also Rhizophora parviflora, *Roxb.*

UR-BHUI. TEL. also called Ur-bhuiwanlu, are mercenary soldiers who serve native sovereigns. They are never found in the ranks of the British army. There are a few of them in every large town in the peninsula of India.* Their name is of Telugu origin, and means town-bhui.

URBUL. HIND. Ficus Roxburghii.

URCEOLA ELASTICA. ROXB.

Vahea gummifera, *Roxb.*	Tabernæmontana elastica, *Sp.*
India-rubber tree, ENG.	Caout-chouc Vine, ENG.

In Sumatra and Pulo Penang, this large woody climber yields caoutchouc of the finest quality in great abundance. Dr. Hooker mentions that a plant which grows in the forests east of Chittagong, the milk of which flows in a continuous stream resembling caoutchouc, is probably the Urceola elastica, which yields India-rubber. The milky juice of the plant oozes out from wounds made in the bark ; on exposure an elastic coagulum separates from a watery liquid ; the coagulum is caoutchouc or India-rubber.—*Roxb. As. Res. p.* 116. *Voigt. O'Shaughnessy, p.* 449. *Hooker. Him. Jour. vol.* II. *p.* 350. See Jintawan.

Wet-khyæ-pai-nai,	Burm.	Piliya,	Tel
		Talia mankena,	,,

This malvaceous plant, as also U. sinuata, are common in most parts of India, and along the coasts of Amherst and Tenasserim; the bark of U. lobata yields a strong and tolerably fine substitute for flax. It is an annual, flowering in December, but though in other respects resembling Triumfetta, the flower is of a light pinkish colour, and the capsules are a little larger than those of Triumfetta lobata, and differ still more in their presenting from three to five grooves, marking the detriscence, or the number of valves or parts of which the capsule is composed; but in other respects the two plants appear alike to ordinary observation, and alike also as to the value of their fibre. They are both generally found growing together, and are two of the most plentiful weeds which are to be found in Pegu. They take possession of all ground recently cleared of tree jungle about Rangoon, and extend without interruption to the Pegu and Tounghoo districts, but become scarce, or only occasionally met with in the Prome and Tharawaddy districts. This plant is the pest of Rangoon and its neighbourhood, springing up spontaneously wherever the jungle is cleared, and rapidly forming a dense mass of luxuriant vegetation. The fibre is manufactured by simple maceration, and afterwards beating the stalks. Very good 'gunny' has been made from it, and it is believed that the fibre might, if treated with due care and skill, prove valuable. Any quantity of the plant may be had for the mere trouble of gathering it.—*McClelland. Royle. Fb. Pl. Roxb. Fl. Ind. Mason, Tenasserim.*

URFALAYURI. Duk. Cicca disticha, *Linn*, properly Harfaleuri, or Harphareuri.

URGHANDAB, a river 250 miles long, rising in the Hazareh mountains, about lat. 33°, lon. 67°, and runs south-westerly to 25 miles past Kandahar; then westerly in the remainder of its course, and falls into the Helmund river, where it is crossed 12 miles from Kandahar. It is ordinarily about 40 yards wide, from two to three feet deep, and fordable; but in inundations becomes much increased. The greater part of its water is drawn off to fertilize the country.

URGINEA INDICA. Wight. syn. of Scilla Indica, *Roxb.*, the jungly-piaz of the Concans.

Holy-fig tree,	Eng.	Raya-manu,	Tel.
Pipal,	Hind.	Raghi,	,,
Arealu,	Maleal.		

The holy fig tree or pipul tree is to be seen in all parts of India. It is much admired by Europeans for its elegant form and the constant movement of its leaves. It is the bo-tree of the Singhalese budd'hists, and is to be met with in that island wherever there is or has been a buddhist temple, but the most famous bo-tree is at the temple at Anarajapura. It was grown from a cutting sent from Hindustan, and in A. D. 1800 it will be 2200 years old. It is held in great estimation by Singhalese buddhists. The Bo-tree is to be seen throughout India, but the frequency of F. religiosa and F. Indica depends very much on the proportion of hindus among the population. In some parts, where the latter is almost entirely mahomedan, these trees are very rare, even allowing for differences of climate.—*Thwaites. Roxb. Powell. Flor. Andh. Stewart.*

U. arctos. Brown Bear of Europe.
U. ferox. Grisly Bear of the Rocky Mountains.
U. isabellinus. Brown Bear of India.
U. labiatus. Black Bear of India.
U. malayanus, of Assam to Borneo.
U. maritimus, or Polar Bear.
U. syriacus of Syria.
U. tibetanus. Black Bear of Himalayas.

The following are synonyms of the bear.

Bear,	Eng.	Ursus,	Latin.
Dub,	Ar.	Riksha,	Sans.
Dob,	Ethiop. Heb.	Deep,	Pers.
Arktos,	Greek.	Karadi,	Tam.
Rich,	Hind.	Gudelgu,	Tel.

The genus Ursus, of the mammalia, is a plantigrade animal, of which four Indian species are known, viz., U. Isabellinus of Horsfield ; U. labiatus of Blainville ; U. Malayensis of Raffles; and U. Tibetanusof Cuvier. U. Isabellinus is, according to Gray, the U. Syriacus of Hemprich and Ehrenberg, and is that known to Himalayan sportsmen as the Brown, Red, Yellow, White, Gray, Silver or Snow bear, or Tibetan Snow bear, and the Harput of Kashmir, for it inhabits Tibet and the snowy regions of the Himalaya, and high Central Asia generally.

Ursus labiatus of Blainville is found all over India, Ceylon and Assam, and is the Ballu or Reech. It has received several scientific synonyms, attaching it to the genera Bradypus and Melurus, and its names in English, Five-fingered Sloth, Sloth Bear, and Ursine Sloth, have corresponded. It is readily domesticated. When wild it lives on roots and honey.

Ursus Malayanus occurs in Arakan, Malay peninsula, Sumatra, Java, Borneo, and in Indo-Chinese countries generally.

U. Tibetanus, the Black Bear of Himalayan sportsmen, inhabits the forest region of the Himalaya, and is very rare in Tibet, though met with in its eastern forests. It seems identical with U. Isabellinus.—*Blyth. Cat.* See Mammalia ; Prochilus ; Ursus.

URSUS ISABELLINUS. Horsf. ; *Blyth.*

U. Syriacus, *Hempr.*

Snow Bear,	Eng.	Silver Bear,	Eng.
Brown Bear,	,,	Barf-ka reetch,	Hind.
Red Bear,	,,	Bhalu,	,,
Yellow Bear,	,,	Har-put,	Kashm.
Gray Bear,	,,	Drin-mor,	Ladak.

The brown bear inhabits the Himalaya mountains, but Dr. Adams says its distribution is not so general as that of the black species, Helarctos Tibetanus, which is spread over the whole extent of the lower ranges of the Indian Himalaya, whereas the brown bear is confined to districts, and prefers high and rugged mountains near the confines of perpetual snow, and nowhere is its fancy better gratified than among the noble chains which surround Cashmere, especially the secluded glens, such as the Wurdwun valley and its offshoots. Bears were at one time very abundant there, but every year shows marked diminution in their numbers, so that, before long, we may expect to hear of the almost complete extermination of the species in the Cashmere ranges. Dr. Adams says that if not a variety, it is certainly very closely allied to that of Europe, Northern Asia, and Arctic America. In Asia the bear of Siberia and the Altai, U. arctos, is called the brown bear ; but this species is said to frequent the Himalayas only. Dr. Horsfield named it Ursus isabellinus from a single skin brought from Nepal, but in colour two specimens are seldom exactly alike.—*Drs. Adams, Jerdon.*

URSUS LABIATUS. Blain. ; *Blyth. Ell.*

Bradypus ursinus, *Shaw.* | Melursus lybicus, *Meyer.*

Helarctos tibetanus,	*Adams.*		

Bhalu ; Bhalak,	Beng	Himalayan Black bear.	
Thom,	Bhot.	Sona,	Lepch.

The black bear's favourite haunts are in the woods and jungles of the lesser ranges of the Himalayas, where it lies all day, to issue forth at night-fall and feed in fields and gardens. The black bear is not uncommon along the foot of the barrier-chains of Cashmere, and during the fruit season may be found in the valley, where its depredations among the apple, walnut, and mulberry trees, are well known, and whole crops of Indian corn are sometimes completely destroyed by these unwelcome intruders. Although said to attack sheep at times, this species is eminently a vegetable feeder, and so expert in climbing trees, that it may frequently be seen on the topmost branches, standing erect, and seizing the branches with its fore-paws.—*Adams.*

URTENYSA. Arab. Cyclamen Europæum, *W.*

URT'HABHEDA. Sans. From artha, and bheda, separation.

URTH ANJAN, a form of divination amongst Indian mahomedans.

URTICA. A genus of plants belonging to the natural order known as Nettle plants or Nettle worts. It is a genus of the order Urticaceæ, some of the species are gigantic and with intense stinging powers. They yield valuable fibres from their stems, which are employed in the manufacture of fine linen. Fortune tells us that on the island of Chusan, there is a species of Urtica, both wild and cultivated, which grows about three or four feet in height, and produces a strong fibre in the bark, which is prepared by the natives and sold for the purpose of making ropes and cables. Hemp is cultivated in the provinces north of the Meiling, but the plant also grows in Fuhkien; the grass cloth made from it is not so much used for common dresses as cotton and silk. There are three Chinese plants which produce a fibre made into cloth known as grass cloth, viz., the Cannabis sativa, or hemp, at Canton, the Urtica nivea, a species of nettle grown about Sucham, and the Sida tiliæfolia, near Tien-tsin-fu.

URTICACEÆ. The nettle tribe of plants are trees, shrubs or herbs, about 300 species of which are known to occur in the East Indies in the following 16 genera, viz.:—

59	Urtica,
1	Parietaria,
2	Conocephalus,
167	Ficus,
14	Artocarpus,
2	Trophis,
11	Bœhmeria,
1	Cannabis,
13	Morus,
1	Lepurandra,
2	Batis,
21	Procris
1	Antiaris,
1	Broussonetia,
1	Dostenia,
1	Epicarpurus.

Many of these plants are lactescent. The genera Urtica, Bœhmeria, and Cannabis, all furnish useful fibres ; the genus Morus, the edible mulberry, and its leaves are the favourite fruit of species of silkworm ; the bark of the Broussonetia is manufactured into a strong paper material ; the genera Ficus and Artocarpus, the fig-trees and jack-trees, yield edible fruits. The cow-tree belongs to this natural order, and apparently to the genus Bresimum. When wounded, a milky nutritious juice is discharged in such abundance as to render it an important object to the poor natives in whose country it grows. It is described by Humboldt as being peculiar to the Cordilleras of the coast of Caracas, particularly from Barbula to the lake of Maracaybo, near the village of San Mateo, and in the vicinity of Caucagua, three days' journey east of Caracas. In these places it bears the name of Palo do Vaca, or Arbol de Leche, and forms a fine tree resembling the Star-Apple of the West Indies. Species of Urtica and Girardinia abounds on the Neilgherries and other localities, and yield a long and silky fibre like the true Rheea or China grass. The two plants of the Urticaceæ that grow on the Neilgherries are the Urtica heterophylla or common Neilgherry nettle, and the Girardinia Leschenaultiana of Dr. Wight's Icones, a superior kind of nettle yielding a very fine strong fibre. The latter plant grows in abundance on the Anamallay range, and in great quantities at the foot of the Coonoor ghaut, at a level of only 1000 feet above the sea. In the Sikkim Himalaya the fibres of some of the various nettles are twisted for bowstrings, others as thread for sewing and weaving ; while many nettles are eaten raw and in soups, especially the numerous little succulent species. When preparing for the Great Exhibition of 1859, Dr. James Taylor named several plants in Bengal adapted for the manufacture of textile fabrics. A species of Urtica, of whose fibres the much admired grass-cloth of China is made, is cultivated in Rungpore ; and either it, or an allied species, the Rheea, is grown in Assam and Cachar, and the Bet-ya and Nway-bet-ya of Burmah, are species of British Burmah—*Roxb. Hooker Him. Jour. vol.* I. *p.* 293. *Voigt. Jur. Rep. Exh.* 1851. *Royle Fib. Plants. Fortune. William's Middle Kingdom. Hog, Veget. Kingd.* See Cow-tree. Maclura tinctoria. Urtica interrupta. URTICA ARGENTEA is a nettle of the Society Islands, the fibres of which are converted into cord.

URTICA CRENULATA. Roxb. iii. 591.

Chor-patta,	Beng.	Mialim-ma	Sikkim.
		Daoun-shaitan	Timor ? ?

A gigantic stinging nettle, a native of the hills and valleys on the east of Bengal, at Luckipore, Pundua Hills, and Assam. Dr. Hooker mentions that where the ground is swampy, dwarf bandanas abound, with this gigantic nettle. It has an erect shrubby stem, with oblong acute leaves, having the margins crenulate or slightly dentate, both sides alike, the bark armed with acute burning hairs. The sting produces great pain, extending to the arm-pit; abates after two or three days, but does not disappear entirely for nine days. Major Hannay says of this and another gigantic stinging nettle, that they afford a quantity of fine white fibre, but apparently of no great strength, and, by report, not very lasting. Some of the hill tribes use the fibre for fabricating coarse cloths. According to Dr. O'Shaughnessy it stings so terribly that it has sometimes occasioned very formidable symptoms. Another urtica, the Daoun-shaitan, or demon nettle of Timor, is still more dangerous in its effects.—*O'Shaughnessy, p.* 578. *Royle Fib. Pl. p.* 66. *Hooker Him. Journ. vol.* ii. *p.* 339. *Roxb.* iii. 591. *Voigt.* 280.

This is a fine tall nettle, with immense leaves and a vigorous sting. It is the most widely diffused of the large Indian nettles, being found in Burmah, in Assam, in south Concan, along the Malabar coast, in Mysore, the Neilgherries, in the valleys of the Himalayas, along the foot of the hills to the Dehra Doon, the northern valleys of the Himalaya, and in many places of the Punjab Himalaya as between Rampur and Sungnam, at 2500 to 7000 feet, where stems are often employed for making twine and ropes by the dry process; but in the N. W. Himalaya, these are not prized, as they perish quickly from wet. It is an annual, with erect angular stems, marked with small white specks, in which are inserted stiff, most acute bristles, which produce intense pain. The bark abounds in fine, white, glossy silk-like fibres, but these probably differ with the locality in which the plant is grown. Dr. Wight describes that of the Neilgherries as a fine, soft, flax-like fibre. and fitted to compete with flax for the manufacture of even very fine textile fabrics. The Todawar race extract it by boiling the plant, and use it as a material for making thread. Samples have been shown at all the exhibitions. To that of 1851, specimens were sent by Dr. Wight, prepared in a rude way, by boiling, by the Todawar of the Neilgherry mountains. Dr. Wight said of it, that it produces a beautifully fine and soft flax-like fibre, which the Todawar race use as a thread material, and, if well prepared, fitted to compete with flax for the manufacture of very fine textile fabrics. Mr. Dickson by passing it through his machine and liquid, rendered it like a beautiful, soft, silky kind of flax, of which the tow would be useful for mixing with wool, as has been done with the China grass, and the fibre used for the finest purposes. Major Hannay says the Assamese use the fibre extensively in the manufacture of cloth. The Chinese prize it for the softness of its fibre, as well as for its strength. Mr. McIvor forwarded to the Madras Exhibition excellent specimens, remarking that the plant grows wild all over the Nilgiris, and as it is well known to the natives, its cultivation might be readily extended. The value put on the fibre was £ 70 to £ 80 the ton. Its cultivation on the Hills would pay well so soon as the rail is finished to Coimbatore; as the seeds are quick of vegetation, the cultivation of this plant can be carried to any extent, and the supply might be largely increased as the plant is abundant and widely distributed over the Indian peninsula. The fibre from the bark of old wood was steeped in cold water for about six days. The bark of young wood was steeped in hot water for about twenty-four hours, when the fibre was found to separate readily from the pulp. Neither of the specimens were exposed more than three weeks to bleach, and consequently, the colour was not so good as would have been obtained had more time been occupied in the bleaching process.—*Great Exhib. of* 1851. *M. E. Juries' Reports, Royle's Fib. Plants, p.* 67. *Dr. J. L. Stewart. Punjab Plants, p.* 215. *Cleghorn. Punjab Reports, p.* 68. *Mr. McIvor in M. E. J. Reports.*

URTICA HYPERBOREA. Jacq.

Zatud,	Ladak.

Gwon, also Goun,	Burm.
Kaloee,	Malay.
Rami,	„

A plant of the Mauritius, Sylhet, Assam, Rungpore, Burmah, Tenasserim, Cochin-China, Sumatra, Moluccas, Japan. Its bark abounds in fibres of great strength and fineness, from which the grass cloth, or China grass cloth, is fabricated. Though this beautiful fabric has long been known, and it is met with bleached and unbleached, it is only in comparatively recent times that it has been ascertained to be manufactured from the fibres of this plant. It is extensively used by the Chinese, being woven into narrow pieces and into handkerchiefs, the export being chiefly to India and the United States, many handkerchiefs being sent to the latter country. Cloths are sent from the Chinese market to South America, made from grass-cloth and nankeen. To obtain the fibre, the plant is cut down and dried, and the bark then stripped. It was cultivated for several years by Major Macfarquhar at Tavoy, who endeavoured to induce the natives to foster it, but it has not yet been brought into general culture. China grass-cloth is made in the Canton province, and largely exported to Europe and America. The plant is also abundantly grown in the adjoining province of Kiang-se. Fabrics of various degrees of fineness are made from this fibre and sold in these provinces, but none so fine as that made about Canton ; it is also spun into thread for sewing purposes, and is found to be very strong and durable. There are two very distinct varieties of this plant common in Che-kiang—the one cultivated, the other wild. The cultivated variety has larger leaves than the other ; on the upper side they are of a lighter green, and on the under they are much more downy. The stems also are lighter in colour, and the whole plant has a silky feel about it which the wild one wants. The wild variety grows plentifully on sloping banks, on city walls, and on old, ruinous buildings. It is not prized by the natives, who say its fibre is not so fine, and more broken and confused in its structure than the other kind. The cultivated kind yields three crops a year. Mr Fortune states that hemp is cultivated in the provinces north of Meiling, but the plant also grows in Fuhkien ; the grass-cloth made from it is not so much used for common dresses as cotton and silk. There are three plants which produce a fibre made into cloth known under this name, viz., the Cannabis sativa, or hemp at Canton, the Urtica nivea, a species of nettle grown about Suchan, and the Sida tiliæfolia near Tien-tsin-fu.—*William's Middle Kingdom, page* 106. *Roxb.* ii, 590. *Fortune. URVASI, the most famous among the courtesans of Deva-lokum, the heaven of the hindu gods.

URYA, the language of Orissa. The original site of the Or or Odru tribe appears to have had very narrow limits, viz., along the coast line from the Rasikulia river near Ganjam, northwards to the Kans river near Soro, in lat. 21° 10′; but in the process of migration and conquest, under the Ganga-vansa line, the limits of Orissa (Or-des) were extended to Midnapore and Hoogly on the north, and to Rajahmundry on the Godavery to the south. It is a tolerably pure dialect of Bengali. In the direction of Bengal, it follows the coast-line as far as the Hijilli and Tumlook divisions on the Hoogly. On the western side of the Midnapore district, it intermingles with Bengali near the river Subanrekha. To the westward, the Gond and Uria languages pass into each other, and at Sonapur half the people speak the one and half the other language. About Ganjam the first traces of Telugu or Teling occur, though the Urya still prevails forty-five miles south of Ganjam on the lowlands of the sea-shore, beyond which Telugu begins to predominate. At Chicacole the latter is the prevailing dialect; and in Vizagapatam, Telugu only is spoken in the open country, though Urya, in the mountains, runs further down to the south. The Urya people are a tall, fair, somewhat slender race. Their country, Orissa or Ur-desa, is bounded on the north by Bengal, on the south by the Northern Circars, on the west by Gondwana, and on the east by the Bay of Bengal. See India.

UTREJ. Arab. Citrus medica.

UTRICULARIA, a genus of plants of the natural order Pinguiculaceæ of Lindley. They are watery or marshy herbs, and about 22 species are known to occur in the E. Indies. According to Walton, one species grows in the Philippine Islands, from the joints of which issues a tendril like that of a vine, at the extremity of which is placed a small receiver resembling a cruet with a neck, and on the top is placed a valve, which serves the place of a stopper. The receiver always stands erect, and is filled with a sweet and pleasant water, except at certain hours, when the valve naturally rises to give room for evaporation ; otherwise the repletion could not take place. The contents of four or six of these little vessels are sufficient to quench the thirst of one person. This plant is found in the province of Bisaya in the island of Luzon, and is evidently one of the pitcher plants.—*Walton's State p.* 121.

UTRICULARIA STELLARIS. Linn.

Buro Jhanji, Beng.

A water-plant of the still lakes of Egypt, Ceylon, and of most parts of India. Its roots become distended with air, and these raise the plant to the surface till its flowering is over, when it settles down to deposit its seed in the ground.

UTRI DAMA. See Junagurh. Inscriptions.

UTRUM. Duk. Cynanchum extensum, *Jacq.*

UTSKA'H. Pusht. Raisins, grapes.

UVÆ. LAT. Grapes.

UVA CHETTU, properly Ava chettu. TEL. Dillenia speciosa, *Thunb.*

UVADHUTA. SANS. From ava, prep, and dhu, to renounce.

UVA MARAM. TAM. Dillenia speciosa, *Thunb.*

UVARIA, a genus of plants belonging to the order Anonaceæ, or custard apple tribe. About 42 species belong to the E. Indies, those growing in Burmah, the "pad-da-gnan," the "ta mot," the "tau-ka-dat-gnan," and "tha-myo-pra-tha," have not, as yet, been specifically determined. U. bicolor, *Roxb.*, and U. bracteata, *Roxb.*, are trees of Sylhet. U. heteroclita is a plant of the Garrow Hills, U. elongata, *Roxb.*, is a plant of Chittagong. U. ventricosa, *Roxb.*, is found in Tipperah, and U. macrophylla in Sylhet and Chittagong. A species of Uvaria, Karee, HIND ? is a tree of Jubbulpore, wood used by natives for making toys. Another Uvaria, Beta-goonda, CAN., grows in the Canara and Sunda forests, and on the jungles inland of Nilcoond, with wood of rather superior quality, being straight and tough. A third species of Uvaria, Thub-bor. BURM., a large tree of Tavoy, has a wood used for boat-building; and a fourth species of Uvaria. Hoom. MAHR. occurs in the Canara and Sunda forests, in jungles east of Kursulee or Black river; It runs tall and straight, wood strong and useful, but is not much known.—*Dr. Gibson. Voigt, pp.* 14, 15. *Cal. Cat. Ex.* 1862. *Mr. Blundell.*

UVARIA CERASOIDES. ROXB. syn. of Guatteria cerasoides, *Duval.*

UVARIA GRANDIFLORA. ROXB.

U. purpurea, *Bl.* | Unona grandiflora, *Lesch.*

A shrub of Burmah, Tenasserim and Sumatra, with large crimson flowers, changing to dark purple; its fruit has the taste and appearance of the North American pawpaw, and they are members of the same natural family. It is the produce of a scandent shrub abounding in the Tenasserim jungles.—*Mason. Voigt.*

UVARIA LONGIFOLIA. ROXB.

Guatteria longifolia, *Wall.; W. & A.*

An elegant tree, with smooth, pointed, and undulate leaves. It is much cultivated in some parts of India to form avenues and to afford shade. In the peninsula of India it is called deodara.—*Eng. Cyc.*

UVARIA NARUM. WALL.

Uvaria Zeylanica, *Lam.* | Unona narium, *DC.*
Narum Panel, MALEAL.

A native of Malabar; a greenish sweet smelling oil, which is used medicinally as a stimulant, obtained by distillation from the roots.—*Simmonds. Eng. Cyc.*

UVARIA ODORATA. LAM.

Unona odorata, *Dun.*

A small tree of Burmah, Martaban, the Tenasserim provinces, Sunda, the Moluccas, and China.—*Voigt, Dr. Mason.*

UVARIA ODORATISSIMA. ROXB.

Artabotrys odoratissimus, *R. Br.*

Its large, yellowish-green, and fragrant flowers appear nearly throughout the year.—*Voigt. Mason.*

UVARIA TOMENTOSA.

Pedda chilka dudugu. TEL.

This has a very strong yellow wood, much similar, but superior, to Nauclea cordifolia. The carrying shoulder sticks, or cowar, are made from it, also used in house building; it does not warp.—*Captain Beddome.*

UVARIA TRIPETALA. ROXB.

Unona tripetala, *DC.*

A tree of the Moluccas. Its largish, greenish-yellow, inodorous flowers appear in March, April, and May.—*Voigt.*

UVARIA UNCATA. LOUR. Artabotrys odoratissimus, *R. Br.*

UVAS. PORT. Grapes.

UVATARA. SANS. From ava, to descend, and tri, to save.

UVATA-NIRODHANA. SANS. From avata, a hole in the ground, and niroodh, to close.

UVE-PASSE-DE-CORINTO. IT. Currants.

UYODHYA. SANS. From a, and yoodh, war, the province of Oudh.

UYANA. SANS. From aya, to move.

UZBEK. A Tartar race found on the Oxus, in Balkh, Kunduz, Khost, Inderab Talikhan, Huzrut Imam, Andkhu, Shib bergam and Bokhara. In all these districts the Uzbek are mixed with Tajik, the lat ters being the older inhabitants. The Uzbek are the resident civilized inhabitants of Central Asia, but in their physical form have become considerably changed from being intermixed with ancient Iranians, and with many slaves from Persian Iran. The typical Uzbek in Khiva has a broad full face, low flat forehead, large mouth, while those of Bokhara are less marked. In the neighbourhood of Kashgar and Aksu the colour is from yellowish brown to blackish; in Khokand brown, and in Khiva white. Timur was an Uzbek Tartar, but Uzbek power rose on the ruin of the Timur dynasty. They have 32 chief divisions, all known by names, many of them similar to those amongst the Kazak, and from this Vambery supposes the Uzbek to be a colonizing tribe. The Uzbek are pious mahomedans. In Khiva and some parts of Chinese Tartary they are brave and warlike, and in this respect they are distinguished from all the other Central Asiatics. Although settled, they retain nomade customs, building houses for stables and granaries, but preferring the raised tent to dwell in. Uzbek men have pretty thick, but never long, beards. The women long retain their white complexion, and with their large eyes, full face, and black hair they are not displeasing. In Central Asia, they are highly renowned for their beauty. The Uzbek of Balkh are simple, honest and humane. Uzbek Tartars are fond of racing at festivals. The bride retires to a screened part of the tent and is followed by the groom. The Uzbek horse and the horses in Bokhara and Maymene possess more strength than speed.

Mouraviev supposes Uzbek to be derived from Uz, his or himself, and 'bek,' master; thus meaning master of himself, or independent. Klaproth derives it from the people called 'Ouz,' or 'Gouz.' By the Arab historians, these were the same as the Ouigour, a Turkish tribe which formerly inhabited the countries to the south of the 'Celestial mountain,' that is, Little Bokharia. At the commencement of the 16th century, the Uzbek passed the Jihon or Jaxartes, proceeding westward. Everywhere they spread terror and desolation. They are at present masters of Balkh, Kharism or Khiva, Bokhara, Ferganah, and some countries in the neighbourhood of Mt. Belut Tagh. The Uzbek tribes who inhabit Khiva are the Ouigour Naiman, Kangli-Kipchak, Kiat-Konkrad, and Noikious-mangood.

When Uzbek Khan was lord of Dasht-i-Kapchak, he introduced the religion of Mahommed into his dominions. On the death of Uzbek Khan in 1342, his son, and afterwards his grandson, followed him, but in 1360 Urus Khan, descended from a younger son of Jojy, became sovereign of Kapchak. The seventh in succession from Jojy was much revered by his subjects, and from that time according to Abul Ghazi Khan, who is partly supported by Khondemir, they called themselves Uzbek, and eventually the Uzbek expelled the descendants of Timur from Mawur-ul-naher, and they still retain possession of Khiva, Bokhara, and Kokand. Uzbekistan is filled with beautifully watered and cultivated valleys. Here we find the Great Bokhara in contradistinction to Little Bokhara; from 34° to 42° north latitude, and from 80° to 92° east longitude. It extends in different directions. It borders towards the south-west from the desert Khawar towards Iran; from the river Amoo to the territory of Balkh; towards southern Afghanistan, through the high galleries of mountains to the Hindoo-Kush, it borders on the southern provinces of China. Since the expulsion of the Turk or Tartar, the Uzbek are the dominant people. They were brought to the country of the river Amur in the year 1498, when they had the centre of their empire at Organtsh, in Khiva. They spread death and destruction over the whole of Turkistan as far as Iran. The celebrated Murad or Beggi Jan raised the nation of the Uzbek. Incessant wars with Persia and Cabul have sometimes extended the empire as far as Merv, Herat, and Balkh; and sometimes it has been reduced to its former limits. The Uzbek are mahomedans, rough and uncultivated, but the Tajik, the original inhabitants, are more civilized. The Uzbek live mostly on cattle, whilst the Tajik are merchants and brokers; their language is the Persian. The Tajik are exceedingly deceitful. The people of Khokand are poor and effeminate, but friends of Europeans, fond of music and of hunting, and of cheerful temper, the women fair but given to vice. The inhabitants of Marghilan are a quiet, inoffensive, and agreeable people. —*Dr. Wolff's Bokhara, vol.* 1, *p.* 312. *Klaproth. Note. Mouraviev Bokhara, p.* 395. *Ferrier's Journey, p.* 89-90. *Markham Embassy, p.* 35. See Khiva. Jews. Kabul. Kaffir. Kalmuk. Kara-kul. Khulm. Tajik.

V. In the English language this letter has only one sound, as in gave, give, love, dove ; but in the oriental tongues, the initial v is often changed into a b or a w, and the final v into a u. In Sanskrit, v has the same sound as in English ; but in Bengali and Uriya, the Sanscrit v is always changed into b, as bari for vari, barsha for varsha ; and the same change often occurs in Hindi, as baras for varsha, sambat for samvat ; in Bengali, also, u is a usual substitute for v ; in Guzerati this is reversed, and v is written for b, as vighu for bigha, vimo for bima. Also, in all dialects, particularly amongst the illiterate, there is a tendency to approximate the sound of v to that of w, or to substitute w for v. In Tamil, the change is not uncommon even in the written language, and varam is frequently written waram. The letter wau of the Persian is often pronounced vau, and in the Urdu or Hindustani the pronunciation of the wau is as often that of w as of v, as wakil, vakil ; wazir, vizir ; darwesh, darvesh ; and hindus frequently change the wau into a b, as walaiti, balati ; nawab, nabab, the nabob of the English. In Marathi, there are both sounds for the same letter, the one exactly like w, the other more like v.—*Wilson.*

VAAG-MARAM. Dalosanthes Indica.

VACCINATION, the process of inoculating with the virus from the pox of the cow, in Latin vaccus. The natives of India usually designate it as " tika dalna," to affix the tika, or sitla nikalna to remove the small pox. The British Indian Government keep up great establishments to carry out vaccination, but it has not yet generally found favour amongst the natives,

VACCINIACEÆ, the Bilberry tribe of plants, are small trees or shrubs, of which about thirteen species are known to occur in the south and east of Asia, in the Neilgherry and Khassya mountains, Tavoy and Java, in the genera Vaccinium, Gaylussaccia, and Thibaudia. Dr. Wight, in Icones, and Voigt give of the genus Vaccinium,

affine,
arboreum,
Donnianum,
Duvalianum,
Griffithianum,
hirsutum,
Leschenaultii,
Malacca,
Neilgherrense,
obovatum,
odontocerum,
serpens,
serratum,
setigera,
venosum,
verticillatum,
Wallichianum,
Schmidianum,
secundum,
Sprengelii.

Thibaudia acuminata, setigera, vaccinium, and variegata, occur in the Khassya Hills, and T. loranthiflora in Tavoy, and Gaylussaccia serrata, also in the Khassya.—*W. Ic. Voigt.*

VACH. SANS. Sweet flag. Acorus calamus. It is also called in Sanscrit. Vacha, Godavuz, Venkund, Haimavati, and Golomi.

VACHELLIA FARNESIANA. *W. & A.*

This armed shrub grows throughout south-eastern Asia, from Sind and the Himalaya to Malacca, is very common in the Dekhan, Mysore and Coimbatore. It furnishes a good, hard, tough, wood, greatly resembling that of the babool or Acacia arabica, but the size is very small. It makes excellent ship knees and tent pegs, and it exudes a useful gum arabic freely and in considerable quantity, from five to twelve pounds annually. The small, deep yellow, powerfully smelling, globular headed, flowers, under the name of wattle flowers, are much employed in perfumery for their delicious fragrance.—*Drs. Wight and Cleghorn in M. E. C. and M. E. J. R., Voigt. Mason. Rohde. Cat. Ex.* 1862. *O'Shaughnessy, p.* 303. See Keekur gum.

VACHES A DIEU. One of the Coleoptera of Hong Kong.

VACHY WOOD.

Mimosa flexuosa, *Rottl.* | Vaghay-maram, TAM.

A large tree, the brown, wood of which is used for making bullock bandies, &c. &c.—*Ains. Mat. Med. p.* 208.

VACOA, of Bourbon and Mauritius, Pandanus odoratissimus ; the tough longitudinal fibres of the leaves are made into sacking. The leaves are cut every second year, and each plant yields enough for two large bags.—*Simmonds' Dict.*

VAGISWARA. See Vageswari.

VAG YATE. See Inscriptions.

VAH, the name of the Oxus in Bendehesh.

VAHAN. San. A vehicle: an animal is appropriated as the vahan or vehicle to each of the mythological personages of modern hinduism. The swan, eagle and bull, appertain respectively to Brahma, Vishnu and Siva, and are severally denominated Hanasa, Garuda and Nandi. Ganesa, eldest son of Siva and Parvati, the elephant-headed god of prudence and policy, rides a rat supposed to be a very sagacious animal. Kartika, their second son, the generalissimo of the celestial armies, mounts on a peacock. Indra, the powerful regent of the firmament, the Jupiter Pluvius of the hindus, rides the elephant Iravatam, symbolical of might. Varuna, genius of the waters, bestrides a fish; as doth also Ganga, the prime goddess of rivers. Kama Deva, the god of love, is carried by a lory, or parrot. Agni, god of fire, by an ardent ram. The Hanasa of Brahma is a goose or swan, Vishnu's Garuda, is half man, half bird, and now, in southern India, identified with the Haliætus Pondicherianus, or Brahmany kite; Pavana has an antelope; Yama, a buffalo; Mungula or Mars, a sheep; Budh, a lion; Shuni or Sani, Saturn, a vulture; Rama, a monkey; Durga or Parvati, a lion and bull; and the other goddesses, the vahans of their respective lords. The vahan of Brahma, Hanasa, or Hahns, sometimes Hahnsi, Major Moor tells us, is precisely the name that in Suffolk, is commonly given to the heron, on which Saraswati rides. The swan or goose, the eagle, and the bull, are the vehicles respectively allotted to the three great powers. The terrestrial sluggish nature of the first, is an apt type of matter personified in the creative power, and a contrast to Vishnu, or spirit, the preserving power, appropriately mounted on the buoyant eagle, the celestial Garuda. Siva, as the destructive energy, is time or justice; and the hindus deem the bull also its type, and give it to Siva as his vahan, or mode of conveyance. These vehicles are supposed by Mr. Paterson (*As. Res.* vol. vii. p. 48) to have allusion to Purity, Truth, and Justice: the first, he says, typified by the swan, which, clothed with unspotted whiteness, swims, amidst the waters, as it were, distinct from, and unsullied by, them; as the truly pure mind remains untainted amidst the surrounding temptations of the world. Garuda, brother to Aruna, is remarkable for strength and swiftness; and the latter is described as imperfect, and, on account of his defects, destined to act as charioteer to the sun, he being the dawn, the twilight preceding the sun. Garuda is perfect light; the dazzling full blaze of day; the type of Truth; the celestial vahan of Vishnu. Perhaps the hindus may, like western observers, have noticed the strong optic nerves of the eagle tribe; and have heard of the fable of the parents destroying such of their brood as are unable to look steadily on the sun: the eagle in western poetry is called bird of the sun, as well as bird of Jove; in both of which characters Vishnu particularly appears. Justice, typified in the sacred bull, is the vahan of Siva: the bull, whose body is Parameswara, and whose every joint is a virtue; whose three horns are the three Veda; whose tail ends where ad'herma, or injustice, begins.—

VAIKANTHA, the heaven of Vishnu, in hindu mythology is the paradise or celestial abode of Vishnu, where he enjoys beatitude in the elysium of Lakshmi's lap. Vaikantha has been located in the frozen ocean, and sometimes in a subterranean sea of milk.

The heaven of Vishnu is described as entirely of gold, and 80,000 miles in circumference. Its edifices, pillars, and ornaments are composed of precious stones. The crystal waters of the Ganges form a river in Vaikantha, where are lakes filled with blue, red, and white water-lilies, each of a hundred and even a thousand petals. On a throne, glorious as the meridian sun, resting on water-lilies, is Vishnu, with Lakshmi or Sri, the goddess of abundance, the Ceres of the Egyptians and Greeks, on his right hand, surrounded by spirits who constantly celebrate the praise of Vishnu and Lakshmi, who are served by his votaries, and to whom the eagle garuda is door-keeper.—*The Mahabaharat. Ward on the History and Religion of the Hindus, vol.* ii. *p.* 14. *Moor's Pantheon, p.* 23. See Balaji. Sampradaya. Tripati.

VAIMBOO. TAM. A Travancore wood of a flesh colour, specific gravity 0·483, two to four feet in circumference, and used for tables &c.—*Colonel Frith.*

VAIMGAY or Vengay. TAM. Pterocarpus marsupium.

VAIPALLE YENNAI. TAM. See Oil.

VAIRAGI, ascetic religious mendicants, properly vaishnava sectarians, especially in the form of Rama, and in relation to him of Sita and Hanuman. Some of these ascetics live in maths, though others of them find employment in conveying, for purposes of worship, the holy water of the Ganges to many of the most distant parts of India, in pitchers slung on bamboos. The term is from the Sanscrit Vi, privative, and Raga, passion, implying a person devoid of passion, and is, therefore, correctly applicable to every religious mendicant who affects to have estranged himself from the interests and emotions of mankind. Virakta, the dispassionate, and Avadhuta, the liberated, have a similar import, and are therefore equally susceptible of a general application. They are, indeed, so employed in many cases, but it is more usual to attach a more precise sense to the terms, and to designate by them the mendicant vaishnava of the Ramanandi class, or its ramifications, as the disciples of Kabir, Dadu, and others. The ascetic order of the Ramanandi vaishnava is considered to have been instituted especially by the twelfth disciple of Ramanand, Sri Anand. They profess perpetual poverty and continence, and subsist upon alms. The greater number of them are erratic, and observe no form of worship; but they are also resident in the mat'h of their respective orders, and are the spiritual guides of the worldly votaries. It is almost impossible to give any general character of these Vairagi, as, though united generally by the watchword of Vishnu or his incarnations, there are endless varieties amongst them, both of doctrine and practice. Those who are collected in the mat'h are of more fixed principles than their vagrant brethren, amongst whom individuals are constantly appearing in some new form with regard to the deity they worship or the practices they follow.—*Professor Wilson, Hindoo Sects. Cole. Myth. Hind. p.* 376. See Sanyasi.

VAIRI SINHA. See Inscriptions.

VAIRRENEGALU. TEL. Arachis hypogea.

VAISALI. See Surya-vansa.

VAISESHKA. See Veda.

VAISHNAVA are followers of Vishnu. All vaishnava sects identify Vishnu with Brahma. The subdivisions of the sect are the Bhakta, Bhagavata, Vaishnava, Chakrina or Pancha Ratrava, Vaikhanasa and Karmahina, each of these again being divided into a practical Karma, and a speculative Inyana or G'niana portion. In Bengal, one-fifth of the population are worshippers of Vishnu in the form of Krishna. The followers of Ramanand and Kabir are the principal subdivisions of this sect. In Southern India, they arrange themselves into two great sects, the Tengale, southern sect, and Vadagale (northern sect); the latter follow a larger ritual and adhere generally to the Sanscrit vedas, but the southern sect use a Tamil translation.

The Charan-dasi are a sect of vaishnava hindus who worship Krishna and Radha. It was founded by Charan Das, who lived in the reign of the second Alimgir, and was a merchant of the Dhusar tribe, a resident of Delhi. His followers are both clerical and secular. At Delhi is the Samadh or monument of the founder.

The vaishnava never worship Siva, though the polytheist saiva hindus worship Vishnu, and go to his temples. Some zealous vaishnava or followers of Vishnu give themselves up to his adoration in some incarnation, Krishna or Rama for instance, but reject with indignation, commensurate with their zeal or bigotry, all further application of divine terms. Hence, in part, the liability under which inquirers labour, of being misled by sectaries into receiving schism as orthodoxy, and of forming general conclusions from individual or partial information.

The vaishnava sect, who worship Vishnu, is variously divided and subdivided. First, the division of Gocalast'ha, or worshippers of Gocal, or Krishna, is subdivided into three :

1. Exclusively worship Krishna and Vishnu himself ; this is generally deemed the true and orthodox vaishnava.

2. Exclusively worship Radha as the sacti of Krishna or Vishnu ; this sect is called Radha Vallabhi.

3. Worship Krishna and Radha conjointly.

6. As the saiva has a fourth undivided sect in the Ganapatya, so the vaishnava has a fourth undivided sect in the Bhagavata, who recognise all divinities equally.

Most of these comprise a number of subdivisions, and besides these acknowledged classifications many individual mendicants are to be found all over India, who can scarcely be included within the limits of any of them, exercising a sort of independence both in thought and act, and attached very loosely, if at all, to any of the popular schismatical sects.

As a rule, the dead of the vaishnava hindus are burned. As death draws near, a lamp is lit at the bed head, and a " homa " sacrifice performed, with camphor and a cocoanut ; and as life dies away, the five elements are dropped into the mouth of the moribund from a tulsee leaf. Within two or three hours, the body is lifted, and this is done early, as none of the household nor any of the neighbours can partake of food until the remains be disposed of. The pile of wood or cow-dung cakes used is about two feet high, and on it are placed some tulsee leaves, a little sandal-wood, and the deceased is laid with his feet to the north. When laid on the pile, a cloth is placed over the face, and raw rice is placed on it over the mouth. The heir of the deceased places a charred bit of sandalwood or a tulsee branch at each corner of the pile, and a Vityan sets fire to the mat, using fire taken from the sacred fire lit at the bedside of the dying man. On the following day the heir and friends visit the pile, remove the skull and the bones, on which he and all with him pour water and wash them,—wash them with the sikai, anoint them with oil and honey, and clean them with milk, and place them all on plantain leaves anointed with butter. A young cocoanut shoot is then placed on the skull, and the whole put into an unburned earthen pot and taken or sent to a river or to the sea—the person who conveyed it returning to the temple, where he pronounces aloud the deceased's name and adds " pray for him." Often they are sent to a holy river, even the Ganges and Benares. The adult male relatives shave. The hair of the brahman widow's head is shaved. The body is not always carried through the doorway of the house. If it be an unauspicious day, or if the house door be so placed that the court yard has to be crossed, then the remains are carried through an opening broken in the wall. The remains are unclothed for the last rites. Children under eight years of age, and unmarried girls are buried, as also are all who die of small-pox, as the belief is that this ailment is a manifestation of the presence of the goddess Ammun, Mariatha, or Kali, and the anger of the goddess would revert to the family if the body were burned.

In the mode of disposing of the dead, the wish expressed by the deceased is attended to. Vedantists all bury, also all the Gosai, all the Lingait, or Vira Saiva, the five artizan castes, the " Kansala," goldsmith, carpenter, ironsmith, brazier, and stone cutter, all the Byragi and Sanyasi, and the gurus of the sects ; likewise all the non-Arian races, and tribes not admitted into hinduism. The Vedantists' dead, and those of the Lingaet artizans, are all placed seated in a grave five feet square with a ledge on the south. As life becomes extinct, the body is made to assume the attitude to be preserved in the procession and in the grave. It is placed against a wall, the legs are crossed underneath in the usual sitting attitude, and the head is fastened to a nail driven into the wall, and so retained till rigidity ensue. They are borne to the grave in a car, on the shoulders of relatives or friends. On reaching the burial-place, the Oodwan reads prayers, and the body is seated on the side ledge with its face looking northwards ; salt and ashes of cowdung are placed on the head.

Amongst the Aryan hindu, the great bulk believe in spirits and worship them : their worship of ancestors, " pitri," is continuous ; they also believe in demons and evil spirits : transmigration through clean and unclean animals is a point of faith, and a great majority regard the soul as an emanation from the deity, and look to re-absorption and annihilation as the point of attainment for the good.

There are many temples in the south of India, belonging both to the saiva and to the

vaishnava sect, considered by the hindoos to be sacred for pilgrimage, as follows, viz :—

Vaishnava temples.

Dwaraka
Jagunnathum
Tiruputhy
Naroyanavunum
Tirvulloor
Triplicane
Kovulum
Mahabalipoorum
Conjeverum
Tirupoogoody
Pully conda
Thyvanoyakum
Strimoostum
Thotadry
Sree Rungum
Moyavurum

Combaconum
Pynee
Chikundamari
Trichundoor
Ramaiswarum
Srisailum
Vulloor
Soobrahmunion
Trivalungaud
Tiruttunee
Senkaramoroyongoory

The vaishnava temple is led up to by a "munduf," the vestibule or pro-naos, of many pillars, and covered with flat slabs of stone. This ends at the gopuram, an ornamental structure with a multitude of draped and nude figures; but the most prominent and oftenest repeated is that of Vishnu holding in his left hand a chank shell, and in the other a disc or chakra. In the centre is the "mindra" or "cella," in which is the idol. Its interior is the "sanctum" or holy of holies, See Maha devi, Math, Lakshmi, Narayana, Vamana, Radha Vallabhi, Sanyasi, Ravana-Prasada, Inscriptions, Vishnu, Sacti, Ramanandi, Ramawat, Rama, Naga; Sri Sampradaya, Hindu, Krishna, Sanakadi, Sampradayi. Vairagi, Senapanthi, Mira Bai, Khaki; Yavana, Surya, Mantra, Charan Dasi, Sikh, Rai Dasi.

VAISHNAVACHARI. Sans. From vaishnava and acharin.

VAISISHICA. See Veda.

VAISSELLE DE L'ILE PRASTEN. Fr. Double cocoa-nut. Laodicea, Cocos de mer.

VAISSELLE DE TERRE, also Poterie. Fr. Earthenware.

VAISWADEVA. See Saraswati.

VAISYA, also Vais, or Bais, or Vesia. Hind. The third of the four grand divisions of hindus: their industry and economy is striking. They are commonly merchants, traders, cultivators, but individuals of the three others are found practising the duties supposed to be exclusively allotted to the Vaisya. The natural duty of the Vaisya is to cultivate the land, tend cattle, and buy and sell. Amongst the earliest dissenters from Indra, were the Yadu race under Krishna's influence. The reasons leading him to this are not known, but the Maha-Bharata makes him say to Nareda his father, "Why worship Indra as the supreme god? O father, we are Vaisya, and our cattle live upon the pastures, let us therefore cease to worship Indra, and pay our devotions to the mountain Govardhana." Up to that time it is to the heaven of Indra that the good who die proceed. The two gods Indra and Agni, Rain and Fire, were the chief deities worshipped by the vedic Aryans. Indra, the sovereign of the gods, was the most powerful of the vedic deities. He is the god of the firmament, the hurler of the thunderbolt, who smote the rain cloud and brought down waters, who delighted in the soma juice, in eating, drinking wine, and war. Indra is now never invoked, but has been succeeded by Vishnu and Siva. Agni, another vedic deity, is the personification of fire, and was worshipped as the destroyer of forests, as useful in the sacrifice, and in the household.

"When generated from the rubbing of sticks, the radiant Agni bursts forth from the wood like a fleet courser."

"When excited by the wind, he rushes amongst trees like a bull, and consumes the forest as a rajah destroys his enemies."

"Such as thou art, Agni, men preserve thee constantly kindled in their dwellings, and offer upon thee abundant food."—(*Rig. Veda* I. 73.)

Varuna was the vedic god of the waters, and god of the ocean, but the name was sometimes applied to the sun and sometimes used as a personification of day. As with other gods, when addressed he was regarded as supreme and capable of forgiving sin :—

"Let me not yet, oh ! Varuna, enter the house of clay ; have mercy, Almighty, have mercy !

"If I go along trembling, like a cloud driven by the wind ; have mercy, Almighty, have mercy !

* * * *

"Thirst came upon the worshipper, though he stood in the midst of waters ; have mercy, Almighty, have mercy."

See Hindoo, Sudra, Zonar.

VAITARINI. See Saraswati.

VAIVARTTA PURANA. See Sakta.

VAIVASWATA, Yama or Dharmarajah, also Vaivaswata Manu, 'The man, son of the sun.' If the sons of Vaivaswata migrated to modern Rajast'han, and settled there soon after the flood, whence come the aborigines? For they did not own the institutions of the hindus, who are supposed to be descendants of Vishnu or Noah.—*Tod's Rajasthan, vol.* I. *p.* 24. See Surya-vansa.

VAISYA KATYAYANA. See Sakya muni.

VAJ. Pers. Acorus calamus, *Linn.*

VAJIRA VALLI. Sans. Cissus quadrangularis.

VAJO. It. Calabar skins.

VAJRAKSHIRA, also Vajrakantaka, Sans. Euphorbium.

VAJ'RAM. Tam. Vaj'ramu, Tel. Glue.

VAJRATA. See Inscriptions.

VAJRA PANI. See Indra.

VAJRATUNDA. Sans. Euphorbia tortilis.

VAJRA VALLI. Sans. Cissus quadrangularis, *Wall.*

VAJRAYADHA, the thunderbolt, Indra's weapon.

VAKA CHETTU, also Oka chettu. Tel. Carissa carandas, *Linn.*

VAKAMBA. Hind. Careya arborea.

VAKANATTY. Tam. A Tinnevelly wood of a white brown colour, used for building in general.—*Colonel Frith.*

VAKIL, an attorney, an ambassador or agent. It is pronounced Wakil, and in Beluchistan, is a person who transacts every kind of business for another. In Persia, the Vakil is still an officer in the courts of justice, called Vakil-ul-Raya, or "the advocate of the people."—*Malcolm's History of Persia, vol.* II. *p.* 453. *Pottinger's Travels in Beloochistan and Scinde.*

VAKHUMBA. Hind. Careya arborea.

VAKILA, a weight used in Arabia for spices, &c., consisting of 10 coffola and nearly 1¼ oz. English; in Bussora the heavy vakla is 4,833 pounds, and the light weight for spices, &c., 1,166 pounds.—*Simmonds' Dict.*

VAKILA also Avuru. Tel. Andropogon muricatus, *Retz.*

VAKKA, also Vakudu. Tel. Carissa carandas, *Linn.*

VAKA. Tel. Areca catechu, *Linn.*

VAKM. Hind. Cæsalpinia sappan. See Bakm. Vakmi rang, lilac, pink; Kulfi rang, purple colour.

VAKUDU. Tel. also Nela mulaka. Tel. Solanum Jacquini, *Willd.*

VAL. Mahr. Dolichos spicatus.

VALABHA NARENDRA. See Inscriptions.

VALABHI. See Balabbi, Balhara.

VALAD AMBU. Tam. Calonyction grandiflorum, *Choisy.*

VALAIT, any foreign country, Europe, &c.

VALAITI-MUNG. Duk. Arachis hypogea, *Linn.*

VALAITI AMLI. Duk. Garcinia cambogia.

VALAITI CHUNA. Hind. Chalk: Calcis carbonas.

VALAITI SUNN, of Muttra, is the Ambari of the Dekhan and Mahratta country.

VALAKA DUDA. Tel. Pterolobium lacerans, *R. Br.*

VALALUVI. Tam. Celastrus paniculata.

VALA MARAM. Tam. Feronia elephantum.

VALAMBIRI-KAI. Tam. Valambiri kaya. Maleal. Tel. Isora corylifolia. *Schott and Endl.*

VALANKAI. In the south of India, the right hand caste of hindus, of which there are 18 sections, viz.

1 Banijaga, or trader
2 Okkalaga, cultivator
3 Jotiphana, oil maker
4 Rangijiva, dyer
5 Ladaru, mahomedan traders and artificers
6 Gujerati, Gujerat merchants, bankers.
7 Komati, shopkeeper, trader
8 Jaina, or Jain
9 Kuruba, shepherd and wool worker
10 Kurumbara, potter
11 Agasa, washerman
12 Besta, fisherman, palankeen bearer
13 Padma sholaysa, a kind of weaver
14 Naindu
15 Upparadu, or tank digger
16 Chittragaru, or painter
17 Golla, or cowherd
18 Waliya, Pareya, Pariah, one who is the fighter of the others.

These vary.—*Wilson's Glossary.*

VALARASI. Tel. Walsura piscidia, *Roxb.*

VALASALA. Tel. Guizotia oleifera. Gingelly. Sesamum.

VALATIPOLAM. Tam. also Palendrabolam, also Villebolam, Myrrh. Balsamodendron myrrha, *Nees ab Esen.*

VALEI.—? Musa sapientum.

VALE KIRE. Tam. Cleome pentaphylla.

VALENTIA, Lord, a traveller in Arabia and the East Indies in the beginning of the 19th century (1805), author (London 1811) of Voyages and Travels to India, Ceylon, the Red Sea, Abyssinia and Egypt, in 1802—1806.

VALENTYN, Francis, the author of an Account of Netherland India, from the Cape of Good Hope to Japan. He was a Lutheran clergyman, born in 1660 at Dordrecht, arrived in 1686 at Batavia as a minister, resided at Japara near Samarang, and then at Amboyna for 12 years, and returned to Holland. He remained in Europe for 11 years, and sailed again for Java in 1705, stayed there two years, then in the Spice Island seven years, and in 1714 he finally returned to Holland. From that time he was engaged arranging his notes, and his first volume Oud en Nieuw Oost-Indien appeared in 1724. This was followed by seven others, all fully illustrated, the last appearing in 1726. The date of his death is not known.—*Bikmore* 147.

VALE-PALAM. Tam. Plantains, vale-elle, Plantain leaves. Vale palam tole. Tam. Plantain skins. Vale-pu, flowers of Musa paradisiaca.

VALERIAN, a Roman emperor who was conquered by Shapoor at Odessa in A. D. 260. Being taken prisoner, he is said to have been treated by Shapoor with great severity, and eventually flayed alive.

VALERIANACEÆ. Lind. The Valerian tribe of plants, of which, in the East Indies, are 3 gen. 16 sp., viz. 2 Nardostachys; 13 Valeriana; 1 Triptostegia. Nardostachys jatamansi, D. C., is the true spikenard of the ancients. It is highly esteemed in India for its perfume and for its medicinal properties as a remedy in hysteria and epilepsy. The Jatamansi or Indian Valerian, the balchur, Hind., of the Himalaya, is an efficient substitute for the European article, and is a very useful stimulant and antispasmodic remedy, chiefly employed in hysteric cases. Dose, one to two ounces three times daily. The true valerian, Valeriana officinalis, is a remarkable feline stimulant. All the species have some medicinal properties. V. Celtica is largely employed by eastern nations as a substitute for the spikenard, Nardostachys jatamansi. Wight gives Valeriana, Arnottiana, Brunoniana, Hookeriana, and Leschenaultii, and a kind of valerian takes the place of Asarabacca. The Valeriana Wallichiana is called dala, wala, bala, charbala mushk, char godar, also probably tagir or takar.—*Powell Hand Book v. p.* 354. *Beng. Phar. p.* 305. See Spikenard also Nardostachys.—*Simmonds' Dict.*

VALERIANA HARDWICKII. Wall.

Nah'ani of	Ravi.	Char of rans,	Indus.

Root.

Asarun,	Hind.	Taggar,	Hind.
Bala,	,,		

This valerian grows in various parts of the Punjab Himalaya and beyond the Indus, at from 6,000 to 12,000 feet; the root is put among clothes to keep off insects.—*Dr. J. L. Stewart.*

VALERIANA. WALLICHII. *DC.*

Mushkw'ali,	Hind.	Bala.	Hind. Jhelum.

Grows in the N. W. Himalaya, at 5,000 to 11,000 feet, up to the Indus. Its roots are exported to the plains to be used medicinally.—*Dr. J. L. Stewart.*

VALERI-KAI. Tam. Cucurbita pepo. Valeri-kai yennai, Tam. Cucumber seed oil.

VALE SHARI-YENNAI. Tam. Trianthema decandra, *Linn.*

VALI. A monkey prince, killed by Rama.

VALISALU NUNA. Tel. Oil of Guizotia oleifera, *DC.*, *W. Ill.*

VALISE CHETTU. Tel. Verbesina sativa, *Roxb.*

VALKYNE. The fatal sisters of the Suevi or Siebi, are the analogue of the twin sisters of the Apsara, who summon the Rajpoot warrior from the field of battle, and bear him to the mansion of the sun, equally the object of attainment with the children of Odin in Scandinavia, and of Boodha and Soorya in the plains of Scythia and on the Ganges, like the Elysium of the Heliadæ of Greece.—*Tod's Rajasthan, vol.* I. *p.* 67.

VALLABHA ACHARYA, the founder of a vaishnava sect. He was the author of the Bhagavat, also of a Bhashya, of one part of Vyasa's sutras and of other Sanscrit works. See Rudra Sampradayi. Math. Hindu.

VALLAI PANDU. Tam. Allium sativum, *Linn.*

VALLAITI-ERA and the Bengal era were established by Akbar. That of Bengal began on the 1st of the month Baisakh, 963+593 =1556. The Valaiti-san was used in Orissa, where it was called the Auel-san, and began on the 1st of the month Aswin 963+592, A. D. 1555.

VALLAK YENNAI. Tam. Lamp oil.

VALLEKHAE. See Inscriptions.

VALLE KIRE. Tam. Gynandropsis pentaphylla, *DC.*; *W. and A.*

VALLEYS of the great rivers and the enclosing seas of India have been the routes followed by the various immigrants into India, Ultra-India, and the Archipelago. The Tibetan district is central ethnically as well as geographically to all the S. E. of Asia and to Asianesia.

The ethnic region of the Indian Oceanic basin is the Bay of Bengal or Indo-Malayan sea, which unites the western margin of the China Malayan basin with the eastern sea-bord of India. The rivers of the Indian

Peninsula connect it closely with the western marginal districts, the watershed being near the Indo-African sea, and the basin of the Ganges, has its head nearly in the same longitude. From all historic times, uninterruptedly to the present day, the sea basins whose ethnic influence has been in operation, are the China, Molucca, Java, Mangkasar, Solo, Mindoro, Molucca,. Banda, Papua, Jilolo, Papuan, Papua Australian and Papua Micronesian seas, and the Archipelagian seas of Johore, the Trans-Javan or Timorean chain, the Bisayan group, Eastern Milanesia, and the different Polynesian and Micronesian groups. All of these are broad highways throughout the Archipelago, permit foreign navigators and natives of the islands to traverse them freely, and admit of constant intercourse with the rivers on the continent, thereby bringing the whole under the operation of foreign civilization.

VALLI. Tam. An article of jewellery worn by women in the ear.

VALLIA CAPO MOLAGU. Tam. Capsicum frutescens.

VALLIAMMA. One of the two wives of Subramanya.

VALLIA-PIRA PITICA. Tam. Urtis latifolia.

VALLI-KANIRAM. Tam. Cocculus acuminatus.

VALLI-GADDA. Tel. Allium cepa, *Linn.*

Vallisneria verticellata.	*L.*	Huttonia serrata,	*Will.*
Saivala,	Hind.	Pu-nat-su,	Tel.

A plant of America, Europe, and India, of the family Hydrocharaceæ. It grows in most parts of India in clear, standing, sweet water, flowers during the cold season, and consists of simple, filiform roots, and a number of fine filiform jointed shoots or stems, some creeping, some floating below the surface of the water; branches solitary, axillary. The Berhampore sugar refiners (indeed, throughout India) use this herb while moist to cover the surface of their sugar, as clay is used in the West India islands; and in two or three days the operation is finished exceedingly well.

The Vallisneria is supposed to possess cooling powers. Thus Madhava says,

> The gentle pressure of her heaving bosom
> Has spread delightful coolness through my frame,
> As if combined upon my skin were strewed
> Sandal and camphor—Saivala and pearls,
> The lotus fibre on the moonstone's dew.

Both Vallisneria spiralis and Hydrilla verticellata are employed by sugar refiners to clarify sugar.—*Powell Handbook vol.* i. *p.* 306. *Roxburgh's Flora Indica, vol.* iii. *p.* 751. *Wilson's Hindu Theatre, p.* 71.

VALLI-TERAGAM. Maleal. Syn. of Ficus rubescens, *Vahl.* Ficus heterophylla.

VALL-ULAVI. Tam. Celastrus paniculata, *Willde.*

VALLUM, in the Carnatic, a measure of capacity, 3½ quarts.—*Simmond's Dict.*

VALLUR. Hind. Cocculus leæba.

VALLUR of Beas. Cissus carnosa, *Lam.*

VALLY CANJARAM. Tam. ? A Travancore wood of a brown colour; specific gravity 0·703, used for building common houses.—*Colonel Frith.*

VALMIKI, a famous Rishi and poet, the reputed author of the Sanscrit poem the Ramayana. Valmiki lived in the era of the revival of the brahminical religion. The framework of the story relates to [illegible] exile from Hindustan named Rama, combined with a hero who fought in the south of India, aided by the people, who were delineated as monkeys and bears. It is a current belief in many parts of India that Valmiki was a thug or strangler. This notion was probably derived from a strain put upon some verses, which make out Valmiki to have been originally, on his own confession, simply a robber. This extract also embraces the received account of the origin of the poet's name. But it is a very curious circumstance that hindu legend gives two of their most celebrated authors, whom they have invested with a sacred character, a descent from the aboriginal and impure tribes of India, Vyasa from a fisherman, and Valmiki from the bad'hak or robber tribe, who associate with the Bhil tribe at Aboo. The conversion of Valmiki, said to have been miraculous, when in the act of robbing the shrine of the deity, is worked into a story of considerable effect in the works of Chand, from olden authority. Valmiki is said to have settled at Chitrakuta at the time of the exile of Rama, but at one time at Bithul.—*Hind. Th. vol.* 1, *p.* 313. *Tod's Rajasthan, vol.* I. *p.* 29.

VAL-MULLAGHU. Tam. Tailed pepper. Cubebs.

VALONIA, the acorn-cups of Quercus ægilops, or prickly-cupped oak, growing in the Morea. About 2 lbs. of valonia are required for the production of 1 lb. of leather, which is said to be less permeable to water than that made with oak-bark, and so heavy as to make valonia the cheapest of all tanning materials except catechu or terra japonica. A mixture of valonia and oak-bark may be used with good effect.

VALULUVY TAIKAM, also Valuluvy yennai. Tam. Oil of Celastrus paniculata, *Willde.*

VALUMBIRIKAI. TAM. TEL. Valumpiri, MALEAL. Isora corylifolia, *Schott and End.*

VALUR. HIND. Solanum gracilipes.

VAL also Wall, a gold and silver weight in Bombay=4·475 grains ; in Ahmedabad, 6·045 grs. ; in Anjir, 5·6 grs. ; in Delhi, 5·63 grs. ; in Poonah, 3·99 grs. ; and in Surat, 5·859 grains.—*Simmond's Dict.*

VAMACHAREE. SANS. From vam, the left hand, and acharin, practice. See Right Hand Caste ; Left Hand Caste.

VAMAM CHETTU, also Omamu. TEL. Ptychotis ajowan, *DC.*

VAMAN. HIND. Withania coagulans.

VAMANA. The fifth incarnation of Vishnu in the form of a brahmin dwarf. The four first avatara are said to have occurred in the earliest or Satya, age of the hindus, corresponding in character with the golden or virtuous age of the fabulists of other regions. The fifth happened in the second, or Tirtyog. Maha Beli, though a virtuous monarch, was still so elated by his grandeur, that he omitted essential ceremonies and offerings to the deities ; and Vishnu, finding it necessary to check the influence of such an example, resolved to mortify and punish the arrogant raja. He therefore condescended to become the son of Kasyapa and Aditi, and the younger brother of Indra, and assumed the form of a wretched brahmin dwarf. Appearing before the king, he asked a boon, which being promised, he demanded as much land as he could pace in three steps : nor would he desire farther, although urged by Beli to demand something more worthy of a king to give. Vishnu, on obtaining the king's promise, required a ratification of it, which is performed by pouring water on the hand of the applicant. As soon as the holy stream had reached his hand, the form of the dwarf began to expand itself, and at length became so enormous that it appeared to extend itself up to heaven : then, with one stride he compassed the earth, with another heaven, and with the third was about to obtain Punja when Maha Beli, convinced that the fro d dwarf was no other patala, to keep off insects. than the god pretended himself, fell prostrate in adoration before him and yielded it up. From this incident of Vamana, Vishnu is also called Trivikrama or the three-stepper. It is maintained by other vaishnava that the ratifying stream poured on the hand of Vishnu in this avatara, was the river Ganga ; which, falling from the hand of the miraculous dwarf, descended thence upon his, now Vishnu's, foot, whence, gushing as a mighty river, it was received on the head of Siva. In M. le Gentil's Voyage aux Indies, a rough map or plan is given, from a native original, of the course of the Ganges, in which it issues from the foot of Vishnu, and falling on the head of Siva, flows in the style commonly seen through the cow's mouth. Except in this instance, Major Moor did not recollect having seen the source of the river delineated as proceeding directly from Vishnu.—*Moor.* See Aditi. Avatara. Salagrama.

VAMBOO. TAM. A Tinnevelly wood of a light straw colour, specific gravity 0·795, used for building in general.—*Col. Frith.*

VAMI or Vamachari. See Right and Left Hand Caste.

VAMINTA. TEL. Gynandropsis pentaphylla, *DC.* syn. of Cleome pentaphylla, *Roxb.*

VAMPIRE. The common Vampire bat, belonging to the Cheiroptera.

VAMPYRIDÆ. A family of mammals, comprising the bats, in the following sections :—

Sub-Fam. MEGADERMATINÆ.

Megaderma lyra, *Jerdon.*

M. Carnatica, *Ell.* | M. schistacea, *Hodgs. Bly. Horsf.*

Large-eared Vampire bat, over all India.

Megaderma spectrum, *Jerdon.* Cashmire Vampire bat.

Megaderma Horsfieldii, *Blyth,* of Tenasserim.

Megaderma spasma, *Linn.* Ceylon and Malayana.

Sub-fam. RHINOLOPHINÆ. Leafy-nosed bats.

Rhinolophus perniger, *Jerdon, Hodg. Blyth.*

R. luctus, *Temm.* | Large leaf bat, ENG.

Nepal ? Malabar ? Java ? Darjeeling.

Rhinolophus mitratus, *Blyth.*

Mitred leaf bat. ENG.

Chybassa, Mussoorie ? Central India.

Rhinolophus luctus, *Horsf.* Java.

Rhinolophus tragatus, *Hodg. Blyth.*

Dark brown leaf bat. ENG.

Nepal, Mussoorie.

Rhinolophus Pearsoni, *Horsf. Blyth.*

Pearson's leaf bat. ENG.

Darjeeling, Mussoorie.

Rhinolophus affinis, *Horsf. Blyth.*

R. rubidus, *Kelaart.* | R. cinerasceus, *Kelaart.*

Allied leaf bat. ENG.

Malabar ? Ceylon, Burmah, Malayana.

Rhinolophus rouxi, *Tem. Blyth.*

R. lepidus, *Bly.* | Rufous leaf bat, ENG.

Malabar, Calcutta, Colgong, Mussoorie.

Rhinolophus macrotis, *Hod. Bly.*

Large-eared leaf bat. ENG.

Himalaya, Nepal, Mussoorie.

Rhinolophus subbadius, *Hodg. Blyth.*

Bay leaf bat. ENG.

Nepal ; Himalaya

Rhinolophus brevitarsus, *Bly.* Darjeeling.

Several other species of Rhinolophus occur in the Malayan islands, China and Japan.

Hipposideros armiger, *Ham. Bn.*

H. nobilis, var, *Blyth.*	Large Horse-shoebat, Eng.

Nepal, Mussoorie, Darjeeling.

Hipposideros lankadeva, *Kel.* Ceylon.

Hipposideros nobilis, *Cantor.* Burmah, Ceylon and Malay peninsula.

Hipposideros speoris, *Bl. El.*

H. apiculatus, *Gray.*	H. Dukhunensis, *Sykes.*
H. penicillatus, ,,	Indian Horse-shoebat. Eng.

India generally, Ceylon, Archipelago.

Hipposideros cenerascens, *Bly.*
Ashy horse-shoe-bat. Eng.

Punjab, Salt Range.

Hipposideros murinus, *Jerdon.*

Rhinolophus fulgens, *Ell. Blyth.*	Little Horse-shoe bat.

S. India, Ceylon, Nicobars, Burmah, Malayana.

Hipposideros larvatus, *Horsf.* Burmah, Malayana, Sylhet.

Hipposideros nobilis, *Cantor.* Malay peninsula.

Hipposideros diadema, *Cantor.* Malay peninsula.

Hipposideros galeritus, *Cantor.* Malay peninsula.

Cœlops Frithii, *Bly.* Tailless bat of Sunderbuns.

Rhinopoma Hardwickii, *Gray, Blyth.* The long-tailed leaf bat of all India, Burmah, Malayana.

Nycteris Javanica, *Geoff.* Java, Malacca.

VAN, a lake about forty miles long, and twenty to thirty broad. Its waters are salt. It is surrounded by a beautiful outline of mountains, whose tops are covered with perpetual snow. The old ruined stone-built town of Ardische is situated on a narrow strip of land running into the lake. There are a few soldiers quartered in it. The borders of the lake about it are low and swampy, and abound in wild fowl and various other kinds of game. On the more northerly and western mountainous tracts, towards Lake Van, and also to the east of [illegible] body of water, dwell the Rewandoozi [illegible]e, a most formidable people, who have [illegible]ver yet submitted even nominally to the [illegible]ttoman or Persian name. They amount to upwards of a hundred thousand families. In the winter they live amongst their embattled rocks, but in the milder months, roam about, pitching their tents from valley to valley. The Amadi and Bitlisi tribes are their near neighbours, and though reckoned amongst the fiercest, have yet suffered. The oaks of the Van, as well as those of the Daroo, yield abundance of gall-nuts, which the inhabitants turn to considerable profit. The wild Amadi and Bitlisi, and the entirely lawless Rewandoozi, may be regarded as the most legitimate representatives of the ancient Carduchians, and probably, neither in manners nor language are much changed since Xenophon traversed their country in his way to Armenia.—*Porter's Travels, vol.* ii. *p.* 471. See Iran. Kurdistan.

VAN. Hind. Salvadora oleoides.

VANA. Sansc. a grove, a forest, hence Van, Wan and Ban, *Wild.*

VANAMALA. See Inscriptions.

VANA CHANDRA. Tel. Flagellaria Indica.

VANANGU. Tam. A Ceylon tree which grows to about eighteen inches in diameter and twelve feet in height, produces a fruit which the natives eat. Its wood is used by the native carpenters in house work, &c —*Edye on the Timber of Ceylon.*

VANAPRASTHA, in hinduism, a man who has gone through his scholar and householder life and has entered the 3rd Asrama or hermit life, has gone "prastha" to the woods ("vana"). It is the Hyllobios of the Greeks. —*Wilson.*

VANARA. See India.

VANDA, a genus of plants, the type of the tribe Vandeæ, of the natural order Orchidaceæ. Wight gives Vanda pulchella, Roxburghii, spathulata, and Wightiana? The continent of India has sent many Vanda for the ornament of the gardens of Europe; several are found in Borneo inferior to none of those from India. One gigantic species introduced into England, Dr. Lindley named V. Lowii.—*Low's Sarawak, p.* 64. *W. Ic. Mason's Tenasserim.*

VANDA CŒRULEA. Near the village of Lernai on the Jyntea hills are oak woods, on which Vanda cœrulea grows in profusion, waving its panicles of azure flowers in the wind. This is the rarest and most beautiful of all the beautiful orchids. The dry grassy hills which it inhabits are elevated 3000 to 4000 feet : the trees are small, gnarled, and very sparingly leafy, so that the Vanda which grows on their limbs is fully exposed to sun, rain, and wind. There i[illegible] moss or lichen on the branches with [illegible] Vanda, whose roots sprawl over the d[illegible] rough bark. The atmosphere is on the whole humid, and extremely so during the rains; but there is no heat, or stagnation of the [illegible] and, at the flowering season, the temperat[illegible] ranges between 60° and 80°; there is mu[illegible] sunshine, and both air and bark are dry during the day. In July and August, during the rains, the temperature is a little higher than above, but in winter it falls much lower, and hoar-frost forms on the ground. But, this winter's cold, summer's heat, and autumn's drought, and above all, this constant free exposure to fresh air and the winds of heaven, are what of all things we avoid exposing our orchids to in England. It is under these conditions, however, that all the finer Indian Orchideæ grow, of which were found Dendrobium, Farmeri, Dalhousianum, Devonianum, &c., with Vanda cœrulea; whilst the most beautiful species of Cœlogyne, Cymbidium, Bolbophyllum, and Cypripedium, inhabit cool climates at elevations above 4000 feet in Khassia, and as high as 6000 to 7000 in Sikkim. Dr. Hooker collected seven men's loads of the superb Vanda cœrulea for the Royal Gardens at Kew; but owing to unavoidable accidents and difficulties, few specimens reached England alive, the individual plant fetching a price varying from 3*l.* to 10*l.* An active collector might easily clear from 2000*l.* to 3000*l.* in one season, by the sale of Khassia orchids.—*Hooker Him. Jour. p.* 319, 321.

VANDELLIA DIFFUSA is a native of Brazil, but is thought to be found also in the peninsula of India. It is the Cætaica of Pison, and is described by Dr. Hancock as emetic, and its decoction as of great value as an emetic and febrifuge, and in the treatment of dysentery. V. crustacea is given in Wight's Icones.—*O'Sh. p.* 477. *Eng. Cyc. W. Ic.*

VANGSUJA. See Brahman.

VANGUERIA, a genus of plants belonging to the natural order Cinchoniaceæ, small trees or shrubs, having ovate or oblong petiolate leaves with lanceolate stipules, solitary on both sides. The fruit of V. edulis is eaten by the natives of Madagascar and of Mauritius, where, as well as into the peninsula of India and into China, it has been introduced. V. spinosa, Mayna, Bengal, which is found in many parts of the plains of India and China, is a distinct species, though united to the above by Sprengel in his 'Syst. Vegetabilium.' The fruit is eaten. V. macrophylla occurs in Chittagong.—*Eng. Cyc. Roxb.* 1,536. *Voigt, p.* 386.

VANGUERIA EDULIS. Vahl.

V. cymosa,	*Gœrtn.*	Vavanga edulis,	*Vahl.*
V. Comersoni,	*Desf.*	,, Chinensis,	*Rohr.*
V. Madagascariensis	*Gmel*		

A native of Madagascar, but introduced into Mauritius, India, and China.—*Voigt, p.* 386.

VANGUERIA SPINOSA. Roxb.

Meynia spinosa, *Lamark.*

A tree of Bengal, Ganjam, and Guntur, height 25 feet, circumference 1½ feet. The bark is employed medicinally in fever. Fruit edible.—*Captain Macdonald. Voigt, p.* 786.

VANI, also Wanara, a pronunciation of Bania.

VANILLA, a genus of plants of the natural order Orchiaceæ, of which V. aphylla, V. aromatica, V. planifolia, V. Walkeriæ, V. Wightii, grow in the East Indies. Dr. Falconer discovered a species while on his visit to the Tennasserim Provinces in 1849.—*Wight's Icones, Voigt, p.* 633.

VANILLA plants have been introduced into India, Bourbon and Mauritius, during the nineteenth century. It adapts itself readily to the climate, it can be easily propagated and cultivated; it occupies very little space, and the fruit is valuable. The amount of va[illegible] exported from Mexico to Spain in 180[illegible] valued at £27,000 sterling. The Mexican [illegible] is not used so largely in England as in Sp[illegible] and on the Continent of Europe, where it [illegible] chiefly employed for perfuming and mixing with chocolate, snuff, liqueurs, and various articles of confectionary. M. Geneve of the Mauritius found the plants grew better when supported by the Moringa pterygosperma, the roots of which are frequently used by Europeans as a substitute for horse radish, the Avocado or Alligator Pear, Persea gratissima, and the Bixa orellana, found in every village.

The vanilla of Brazil sells for £4 per pound, but cannot be compared in any way, either as regards smell or size of fruit, with the vanilla of Mauritius. One pod gathered by M. Geneve weighed 2¾ drams; it would take then about 96 pods for one pound. In 1835, Messrs. Loddiges of Hackney sent out a few plants to the Calcutta Botanic Garden; they flowered about four years after their reception, but failed to perfect their fruit, and died shortly after. The experiment was repeated a second time through the liberality of Lord Auckland, who presented, with a number of other useful and ornamental plants which he brought out with him in 1836, two plants of Vanilla; these grew readily, but we believe never blossomed. Plants subsequently obtained have, however, blossomed and fruited abundantly.

In 1853, Dr. Mouat, on his return from Mauritius, presented the Agricultural and Horticultural Society of India with a few plants of Vanilla aromatica and planifolia, which he had obtained from the late M. Bojer. These have been cultivated most successfully, and freely propagated from. A good crop of fruit was gathered from the older plants in 1855, which was favorably reported on by local confectioners. To make it of commercial value, the pods should be long and of a very dark-brown color, almost approaching to black: they should also be moist, and if properly ripened before being packed, they become after a time covered with a circular crystal, which adds to their appearance and marketable value. The blossoming commences in February, and the pod ripens in December. The only enemy to dread is the cold wind in that month, which sometimes nips the pod and causes it to fall before it is properly ripened: a mild December is consequently beneficial to the Vanilla fruit. The pods should be carefully dried, by exposing them on cloth to the sun's rays; and that while warm, they should be wrapped in woollen, which promotes evaporation, and at the same time absorbs the moisture. When thus treated, the pods blacken and put on a silvery lustre. On this appearing, they must be again exposed to the sun, and thoroughly dried. He adds that a fully developed and properly ripened pod should be from 6 to 7 inches long, and about three-eighths of an inch in diameter. In its native country the plant continues to bear from thirty to forty years, and yields, in ordinary seasons, from forty to fifty pods annually, or say half a pound weight; so that each plant may be considered equivalent in value to twenty rupees per annum, requiring very little care and expense in its culture, and only an ordinary amount of care in preparing its produce for exportation.—*Indian Field.*

VANILLA AROMATICA. Swz. Epidendron vanila, *Linn*, var. flore viridi albo. *Plum.*

Menaes Geraes of BRAZIL.

Vanilla aromatica is said by Martius to yield the true vanilla, but the best Mexican vanilla is the produce of V. planifolia, of which Pereira mentions V. sativa and V. sylvestris as two varieties.

The plants should be grown in a shaded situation, the material necessary to ensure a healthy growth ought to be open and free to allow the water at certain seasons to pass off freely from the roots, and admit a certain portion of air, and it should, from its creeping habit, have the rough bark of a tree, jaffery work, or wall, to which to attach its long roots. The situation should be well shaded from the sun, and the material in which the whole of this variety of plant thrives best is a mixture of lime rubbish and brick bats, or other such material, with one-fourth half-decayed leaf mould: the whole should be well mixed together before placing it round the trunk of the tree or other situation chosen to cultivate the plant. The bed should be made three feet wide on the surface of the ground at the north-east side of the butt of the tree, and it should be raised two feet high. A quantity of the largest lumps of the material should be placed at the bottom to ensure a good drainage, and the plants should be watered immediately after planting to settle their roots in the new situation. The stem of the plant should also be fastened up to the tree, so as to encourage the roots to take hold and cling to the substance against which it is intended to grow: after this the plant will merely require a good drenching with water once a week only during the hot weather, to ensure a healthy growth. Hot winds are fatal to the plant, and cold winds, when accompanied by rain, are said to cause the flowers to fall without being followed by pods. The American method of growth is under forest trees, and artificial impregnation (owing to the presence of the Vanilla-fly) is not resorted to, owing mainly to the small price realized at Vera Cruz.—*Indian Field. Mr. H. D. Rae.*

VARAHA, or the Boar. In this, the third avatara of Vishnu, he is generally represented four-handed, armed as usual, and with the head of a boar, on whose tusks rests a crescent, containing in its concavity an epitome of the earth, which had been immerged in the ocean as a punishment for its iniquities. So that this, as well as the first and second avatara, seems to be a repetition of the story of the deluge : the second combines with it a portion of astronomical allegory ; and none of the other of the ten avatara have any apparent reference to the universal catastrophe, so pointedly indicated by the three first, which are understood to have occurred in the earliest ages of hindu legend, if such a chaotic mass as their fabulous records may be dignified by such a term. There are many fables accounting for the shape thus assumed by Vishnu on this occasion ; and the boar is in hindu legends, as well as in the mythological romances of Greece and Egypt, an animal very frequently introduced. In an ancient legend, relating to the destruction of the city of Mahabalipoorum, and the seven pagodas, on the coast of Coromandel, by an earthquake and inundation during an early period of hindu history, it is stated that Hirancheren, a gigantic prince or demon, rolled up the earth into a shapeless mass and carried it down to the abyss : whither Vishnu followed him in the shape of a hog, killed him with his tusks, and replaced the earth in its original position.

In the mythology of the ancients, the wild boar was sacred to Typhon. In India, the Rajputs, on the first day of spring, worship Vasanthi or "spring, basant'h" personified, and on that day the prince and vassals chase, slay and eat the wild boar. Personal danger is disregarded on that occasion, as want of success is deemed an omen that Oomia, the great mother, may refuse petitions during the year. The boar hunt at spring time was a Scythic custom amongst the Scandinavian Asi; the grand festival to Freya was in spring, when boars were offered to her by the Scandinavians, and boars made of paste were eaten by the people. The festival in Rajputana is called Ahairea, and has a religious origin. The boar is the enemy of Gouri of the Rajpoot: it was so held of Isis by the Egyptians, of Ceres by the Greeks, and of Freya by the North-men, whose favourite food was the hog : and of such importance was it deemed by the Francks, that the second chapter of the Salic law is entirely penal with regard to the stealers of swine. The heroes of the Edda, even in Valhalla, feed on the fat of the wild boar Serimner, while the illustrious father of armies fattens his wolves, Geri and Freki, and takes no other nourishment himself than the uninterrupted quaffing of wine : quite the picture of Hur, the Rajpoot god of war, and of his sons the Bhyru, Gora and Kala, metaphorically called the "sons of slaughter." The cup of the Scandinavian god of war, like that of the Rajpoots, is the human skull (capra).—*Tod's Rajasthan, vol.* i. *p.* 566. *Coleman, Moor.*

VARAHA, the reputed author of a system of astronomy referred to in the Surya Vasis-t'ha, and Soma Sid'hanta, and therefore supposed by modern sastri to be anterior to them all. But European commentators entertain a belief that the work which goes by Varaha's name in present times, is not the real one; and that the treatise which has reached us, is a compilation of no older date than the ninth century.

VARAHA MIHIRA, another astronomer, thought by many to have been contemporary with the emperor Akbar; but whom others are apt to confound with Varaha Acharya, and others of the same name. The Telugu astronomers consider that Varaha Mihira flourished in the 3600th year of the Caliyug (A. D. 499), *i. e.*, at the close of the 2nd Padah of the Ayanansa, when the sun, moon, and equinoctial points (according to the doctrines of the Surya Siddhanta) were in the first point of the hindu sidereal zodiac; or, in other words, when the Rishi were in the 1st point of the solar sign Mesha *r*, and in the same of the lunar mansion Aswini.—*Warren.*

VARAHA PURANA. See Mahadevi, Kala-Priyanath.

VARA-HUN, a name in the Madras presidency for the commercial pagoda, the 10th of the pollam and the 8th of the seer, weighing 54·68 grains; and for the native pagoda, which is 52¾ grains.—*Simmonds' Dict.*

VARMA, also Varma Deva. See India-Inscriptions.

VARNA. SANS. a tribe, a class. Varna-Sankara, a mixed tribe, or of mixed race.

VARNISH. The art of the varnish-maker is an important one, and it requires, for its successful prosecution, a considerable amount of chemical knowledge, and the greatest care. Copal, mastic, and amber varnishes are much employed by the artist and by the photographer for the preservation of their works. The last is perhaps superior to any of the other. Far less attention is paid to the peculiar properties of varnishes than could be desired.

The artist employs a varnish for the purpose of securing his labours from the combined influences of light and air; but it must never be forgotten that he is employing a material which is itself constantly passing, by the absorption of oxygen, into a state of disintegration. Artists know that many varnishes rapidly change colour, and that some are more liable to crack than others are. A few preliminary experiments may be made of great value. For example, if portions of various samples of varnish are spread upon a plate of glass and dried, we have the means of determining many important points. Cover one half of the varnished glass with an opaque screen, and expose the other half to sunshine day by day; by placing the glass upon a sheet of colourless paper, it will be seen whether any colour has been imparted by the action on the sunshine. After a few days if the whole arrangement be placed in spirits of turpentine, the varying degrees of solubility may be noted; and from this may be determined the rate at which, under ordinary circumstances, oxygen is absorbed—the rate, indeed, at which the elements of destruction proceed. Thus a considerably greater degree of permanence may be secured, than when the artist, trusting only to the varnish-maker, employs a preparation about which he knows nothing.—*Robert Hunt, in London Art Journal of December* 1858.

VARNISH TREE. See Dryandra cordata.

VARNISH TREE of CHINA. Elæococca vernicia.

VARNISHED WARE. The Burmese process of making this ware has been minutely described by Major Burney, who witnessed every branch of the manufacture at Amrapura, and the museum of the Asiatic Society in London contains several specimens of various kinds, as well as a set of cups, in every state from the first weaving of a few strips of bamboo to the complete formation of an elegant article of domestic economy. A description of each specimen will best explain the whole process. The first is a wooden frame of wood covered with strips of bamboo woven together so as to form a basket, which is the frame-work of the intended cup; the weaving is like that of a lady's work basket, and care is taken that it shall be as thin and light as possible, as upon this matter the beauty and delicacy of the ware will depend; towards the edges, the weaving is of a coarser nature, and the bamboo is made as fine as hair. The basket is covered on the outside with varnish laid on with a brush made of the husk of the cocoanut. The varnish is the essential part of the manufacture, without [illegible] nothing can be done; it is [illegible]present- (wood oil), and is procured from a tree of which there are extensive forests in the northern parts of the Burmese empire. The varnish may be gathered at all times, but if taken during the flowering season, which is at the beginning of the year, it does not harden well. It appears to be in many of its properties analogous to China varnish, and it affects in a similar way the health of those who prepare it, not apparently to such a degree as in China, but still enough to be very unpleasant to those unaccustomed to it, who frequently find their hands blistered and their arms and faces swelled with its effects. All who use it take certain precautions against accidentally swallowing any portion, and they are careful to touch it with the right hand only, while they take their food with the left. Some persons are more seriously affected by the varnish than others, and its injurious effects appear in blotches so much resembling leprosy, that the other Burmese refuse to hold intercourse with the affected person. The varnish, as before remarked, is laid on with a brush, to spare the hand as far as practicable: but in all future operations on the same vessel, it is laid on with the hand both in order to procure a fine surface, [illegible] enable the workman to discover and reject the minutest particles of dust. When first laid on, the varnish looks of a light brown colour, but rubbing with the hand turns it to a fine black. When the cup is varnished, it must be carefully shut up in a box to exclude the dust, and then deposited in a deep cold vault. This is said to be essential to its proper setting, and with one of which every manufactory is provided. The cup is kept in the vault at least th[illegible] days.

[illegible] process, the cup is advance[illegible] towards completion, it is co[illegible] a thick black paste, which is intended [illegible] up all holes in the baskets and to give the ware a body. Different pastes are used for this purpose, but all agree in being composed of some fine powder mixed up with thit-tsi; in one sort, the powder is that of calcined bones; in another the fine saw dust of teak wood; in all cases [illegible] paste is dabbed on with the fingers, so as to [illegible] the basket as far as the workman is able to do. The specimen under description looks black and rough, and the basket appears in several places through the paste: after this process, as well as after every other in which the varnish is used in any shape [illegible] cup is returned to its concealment in t[illegible] where it must remain at least thre[illegible] his [illegible] subsequent operation can [illegible] no other nouris[illegible] than [illegible] uninterrupted quaffing of [illegible] is ground the picture of Hur, the Rajpoot god [illegible] a clumsy lathe, more like the roller on which a jack towel is hung behind a kitchen door than the instrument Europeans call a lathe. This roller is turned backwards and forwards with a stick and leather string like the drill bow of European workmen, and a hollow cylinder. The workman inserts the rough cup, and if it be not large enough to stick tight in it, he fixes it there by slips of bamboo; he then smears the inside of the cup with water mixed with an ochrey red earth, turns the lathe rapidly with his right hand, and presses a piece of pumice stone held in his left hand against the inside of the cup; this process soon rubs down the rough surface of the paste, and is continued until it is quite smooth. The specimen is smooth on the inside, the paste is rubbed down quite level with the basket work which appears through it, but without injury to the smooth surface. The outside of the basket is unaltered.

5, In the fifth part of the process, the cup undergoes precisely the same operation on the outside, the only differences in the manipulation being that the cup is fastened upon a frame or chuck, so as to leave the outside open to the workman, instead of being put into a basket to expose the inside.

6. In the sixth process, the cup is covered on the inside with an additional quantity of paste of finer quality, which is laid on by the workman after the outside is ground smooth, and dried, in order that it might receive an additional polish on a subsequent day.

7. In the seventh part of the process, the cup is covered with fine paste on the outside as well as on the inside. Its appearance is rough and black. In this stage the cup is ground outside and in, and has also received a coat of fine varnish. This is the result of the two successive operations with the interval of at least three days between them, the grinding is performed on the lathe, as in No. 4 and 5, but instead of pumice stone the workman employs first a piece of smooth sandstone, then a rag with charcoal and water, and lastly a piece of moist cloth. The cup is dried well in the sun before the varnish is laid on, which is done with the finger.

8. In the next step, the cup receives a second coat of varnish and is quite black and glossy, but not even on the surface. Thus far all the Burmese ware goes through the same processes whatever may be the style in which they are to be finished, whether black or red, plain or figured. The remaining specimens show the various modes in which the manufacturers finish off their work, according to their own taste or that of their employers.

9. In the ninth part of the process, the cup is simply polished in the lathe; this is performed by turning first against a piece of smooth stone as in No. 7, then by moistened rice husks held in the hollow of the left hand against the cup while turning; thirdly by a rag dipped in well pulverised teak wood, and lastly by the hand smeared with a peculiar polishing powder, said to be made of the petrified wood of a tree. The ware thus furnished is like the black japanned ware used in Britain.

10. In the ware of a red colour like sealing wax, not so fine as British red japanned ware, but still clear and bright, the colour used is manufactured at Ava, and is said to be superior to the best Chinese vermillion; it is moistened with an oil called shazi, extracted from the kunyen (Dipterocarpus turbinatus) and then mixed with thit-tsi varnish. The mixture is laid upon the cup after it has gone through the two first operations of No. 9, and nothing more is required than giving it a polish with the hand unless extraordinary lustre is desired, when a mixture of shazy and thit-tsi is applied,

11. In the cups executed in the Shan or Siamese style, the engraving is done with great ingenuity and rapidity, although the only tool is a needle tied to a stick and whetted on a bit of slate. The artist holds the cup on his knees with his left hand and keeps his graver almost motionless in his right, he then dexterously turns the cup by the help of his knees to meet the graver. The Shan style consists in engraving a piece of black ware as No. 9 and filling up the hollows with vermillion, if any figures are represented they are left in relief, in the manner of wood engraving. Some grotesque figures done in this way are to be seen in many specimens. The vermillion is laid on as in No. 10, and after drying several days is rubbed off in the lathe with wet bran held in the hollow of the hand. The operation is generally repeated to ensure a complete filling up of all hollows, and the cup is afterwards varnished and polished.

A more expeditious method, called the Burman style, consists in engraving upon a red cup left as in No. 10 and filling up the hollows with different colours, usually yellow or green. Some specimens are engraved with grotesque Chinese looking figures, and with the lines filled with yellow or primrose. The engraving is first prepared by being varnished over, and the colour is immediately rubbed in with the finger until it is quite dry. When the cup is finished sometimes a small quantity of indigo is mixed with the orpiment, which produces a green colour. Several articles in the R. As. Society's museum are very finely executed in this way, some of which have both colours in the same specimen. The beauty of the engraving consists chiefly in the contrast of bright colours, and the regular interlacing of minute lines, in which some specimens resemble our engine turning; taste in drawing is totally out of the question.

There are other modes of preparing the varnished ware: the finer sorts are sometimes finished with gilding or with raised figures or mouldings. These are formed of the teak-wood paste mentioned in process 3, which is pressed when soft into tin moulds, and when dry it becomes as hard as the wood of which it was originally made. Europeans have found this paste an excellent material for making the raised work on picture frames and similar objects. Some articles are diversified by leaving portions of the basket-work uncovered by the varnish; in this case the weaving is of the finest quality, and the open parts being of different patterns, the effect is very good. Larger works are made of wood joined together with teak paste, and afterwards covered in the same way as the basket-work, the only difference between the process being that in the wood work, the first varnishing is omitted, the solid and flat surface of the wood taking the paste at once without preparation.

Mr. Fortune says with regard to the varnished ware of China, that the tree which yields the Chinese varnish is a species of Rhus, which, although producing an article of great value, is extremely dangerous to use. The varnish is largely used in the country for giving a fine polish to tables and chairs used in the houses of the wealthy. The beautiful lacquer ware so extensively exported from Canton to foreign countries, and which is so well known and justly admired, is produced by this tree. It has the valuable property of being less liable than French polish to be injured by a heated vessel which may be placed upon it, but it is very poisonous and requires to be handled with great care by the workmen who use it. Indeed, after furniture is dry, it is very unsafe for certain constitutions until it has been in use for some time and the smell entirely gone. A friend of his, Mr. Jones, American Consul at Foochowfoo, used some furniture which had been lacquered some time and was apparently quite dry, and yet he was very ill for a long time from its effects, so ill that he thought he should be obliged to leave the country and go home; and he has known several persons suffer most severely from the same cause. Mr. Williams adds that the beautiful appearance of the lacquered ware of China owes its lustrous coloring to a composition of lampblack and the clarified juice obtained from a species of sumach called Rhus vernix or R. vernicia. Wood oils are obtained from other plants of the same family, and the different qualities of lacquered-ware are owing to the use of these inferior ingredients. The real varnish tree is described by De Guignes as resembling the ash in its foliage and bark, it is about fifteen feet in height, and when seven years old furnishes the sap, which is carefully collected from incisions in the trunk opened in summer nights. The body of the ware is wood partially smoothed, or pasteboard, upon which two or three coats of a composition of lime, paper, and gum are first laid, and thoroughly dried and rubbed. The surface of the wood is also hardened by rubbing coarse clay upon it, and afterwards scraping it off when dry. Two coatings of lamp black and wood oil, or in the finer articles, of lamp black and varnish, are laid upon the prepared wood, and after drying, the clear varnish is brushed on, one coating after another, with the utmost care, in close and darkened rooms, allowing it to dry well between the several coats. The articles are then laid by to be painted and gilded according to the fancy of customers, after which a last coating is given them. The varnish is brought to market in brownish cakes, and reduced to its proper fluidity by boiling; it is applied to many purposes both as a varnish and paint, when it is commonly mixed with a red or brown color. A beautiful fabric of lacquered-ware is made by inlaying the nacre of fresh and saltwater shells in a rough mosaic of flowers, animals, &c. into the composition, and then varnishing it. Another kind, highly prized by the Chinese, is made by covering the wood with a coating of red varnish three or four lines in thickness, and then carving figures upon it in relief. The great labour necessary to produce this ware renders it expensive. A common substitute for the true varnish are the oils of the Dryandra, Jatropha, Croton, and other members of the euphorbiaceous family, expressed from their seeds by a variety of simple machines, consisting for the most part of different applications of power to cylinders and pestles, by which the seeds are pressed or pounded. The oil, after pressing, according to De Guignes is boiled with Spanish white in the proportion of one ounce to half a pound of oil; as it begins to thicken it is taken off and poured into close vessels. It dissolves in turpentine and is used as a varnish either clear or mixed with different colours: it defends woodwork from injury for a long time, and forms a good painter's oil. Boiled with iron rust it forms a reddish brown varnish. In order to prevent its penetrating into the wood when used clear, and to increase the lustre, a priming of lime and hog's blood simmered together into a paste is previously laid on.

Varnished ware is also made in India. In peninsular India the varnish used by moochee men for palanquins, &c., is prepared by melting sandarus (a kind of copal or Anime called by Dr. Ainslie sandarach,) and mixing it with boiled linseed oil rendered dry by litharge; they do not usually add spirits of turpentine in the way prescribed for making copal varnish in England. Mr. Rohde knows of no better or more durable polish, for teak and chittagong wood particularly, than may be prepared by melting three or four bits of sandarus of the size of a walnut or small egg, and pouring upon it a bottleful of boiling linseed oil (Avisha noona, Tel.) previously rendered dry by boiling litharge or other drier, and after boiling them together for an hour gently adding, while cooling, a tea-spoonful of Venice turpentine. If too thick it may be thinned with spirits of turpentine. It should be rubbed on the furniture and after a little time, during which it may be exposed in the sun, rubbed off; the rubbing should be continued daily, and the polish should not be again applied for eight or ten days, after which it may be slightly applied every one or two months. Water does not injure this polish, and any stain or scratch may be rubbed over with the polish which cannot be done with French polish. To give the appearance of gold to silver leaf used by the Condapilly moochies for ornamenting boxes, palanquins, &c., a little aloes is dissolved in the varnish which is laid over it. A very good varnish is prepared by moochies with shell lac and wood oil heated in small quantities.—*Rohde MSS. Fortune, Residence, p.* 146. *William's Middle Kingdom, vol.* I. *p.* 121. *Journal Royal Asiatic Society.*

VARTAKA. SANS. Solanum melon Egg-plant. Brinjal.

VARUNA. SANS. Cratæva tapia. C. R burghii. C. religiosa.

VARUNA, one of the gods of the ancient hindus, of the times of the Vedas. He is the god of the waters, the analogue of Neptune. He is regent of the west, and lord of punishment, in which latter capacity he resembles Yama, and, like him, holds a snaky cord or noose with which he binds incorrigible offenders under the water. His vahana or vehicle is the fabulous fish called makara. Varuna is Ouranos, the [illegible] sonified; two hymns in the [illegible] sed to him. He gave a son to king Harischandra and required the same as a sacrifice. Varuna is rain, the sky, or hemispheric firmament, resting on the waters, and has obvious analogies with the Grecian Uranos. To this god, singly or associated with Mitra, are offered the rare and perfunctory prayers for protection from sin, which appear in one or two of the vedic hymns. A common medium between the Grecian and Aryan mythology may be inferred, and that Mena and the Aswini, Anna and Varuna, were not (so to speak) indigenous. See Aditya, Brahminicide, Hindoo, Indra, Inscriptions, Osiris, Saraswati.

VASANTA. SANS.? Phaseolus, sp.

VASANT'HI, amongst the Rajputs, is spring personified, as the consort of Har, and is worshipped by them. On the first spring day, the Rajput princes and vassals open the season with a great boar hunt. On that day, personal danger is disregarded as want of success is deemed an omen that, during the year, Oomia, the great Mother, may refuse all petitions.

VASANTOTSAVA, Madhutsava, or Kamotsava, is a festival held on the thirteenth and fourteenth of the hindoo month chaitra, at which Kamadeva, the god of love, was formerly worshipped. The season was one of much merriment, and the general influence of returning spring was hailed with music and jollity. Part of the amusement of the people consisted in throwing over each other, by means of syringes, water or fine powder, coloured with saffron. A missile commonly used in some places is rose leaves, large baskets and trays of which are prepared for that purpose. The festival of Kamadeva holds its place in the kalendar, but its observance is restricted to a few places. In fact, it seems to have merged into the Phalgunotsava or Holi, celebrated a month before, when the like merriment and affusion of coloured powder or water takes place. In the south of India, Kama is worshipped at this period, also, which still further identifies the origin of the festival, although it has undergone some. important modifications in date and purpose.—*Wilson's Hind. Theat. vol.* ii. *p.* 268.

VASCO DE GAMA, when at Calicut, was shown in basins of water, the three ships he had with him. When Don Francisco de Almeyda, the first viceroy of India, was returning to Portugal, some witches of Cochin told him he should not re-pass the Cape of Good Hope : he did, however, re-pass the Cape, but was buried at the bay of Saldanna, some leagues beyond.—*Lubbock Origin of Civilization, p.* 149.

VASHAMBU. MALEAL. Acorus calamus, *Linn.*

VASHISTA and Visvamitra amongst the hindoos, were two historical persons, and two modern schools were named after them. Amongst the hindus Vasishta is a famous rishi, fabled to have possessed a cow named Shuboola, so fruitful that with her assistance he could accomplish whatever he desired. By her aid, he entertained king Visvamitra and his army. See Brahmadica. Inscriptions. Sati. Veda.

VASMA. HIND. Powdered indigo leaves.

VASOKY. See Kurma.

VASSA. TEL. Acorus calamus, *Linn.*

VASSA. HIND.? a weight used at Surat for pearls and the precious metals 0·1423 grains.—*Simmond's Dict.*

VASSAMBOO. SANS. Acorus calamus aromaticus.

VA'STU YAGA. On the morning of the day previously fixed for entering a new house the hindoo owner performs the usual morning prayers and ablutions, and having thus purified himself, he presents, according to his means, pieces of gold to brahmans, a waterpot is filled with water, and on it are placed fruits, flowers and mango leaves.—*Elliot Sup. Glos.*

VASU, in hindoo mythology, a name of eight semi-divine beings, personifications of natural phenomena, whose names are variously enumerated. In the Vishnu Purana they are thus given : 1. A'pa, water, or according to others, Ahar, day, 2. Dhruva, the Pole-star. 3. Soma the moon. 4. Dava, fire. 5. Anila, the wind. 6. Anala or Pavaka, fire. 7. Pratyusha, dawn. 8. Prabhasa, light. They are represented as always attendant on their leader, Agni or Fire, and in their relationship to this deity and to the worship of the sun and light, seem to belong to the vedic period of hindu mythology.—*William's Story of Nala, p.* 215. *Wilson's Vishnu Purana, p.* 120. See Ashta, Lakshmi.

VASUKI, in hindoo mythology, a serpent king, which the hindoo gods used as a rope when they churned the sea of milk.

VASU-DEVA. See Avataram; Inscriptions; Kanwa Dynasty ; Krishna ; Magadha ; Sri Sampradaya.

This large and stately tree grows to the height of about 60 feet, It has entire, smooth, coriaceous leaves, and terminable panicles of white flowers. The young shoots and all tender parts except the leaves are covered with fine stellate pubescence, leaves alternate, petioled, oblong, entire from emarginate to obtuse, pointed, smooth, coriaceous, from four to eight inches long and two to four broad, petioles round, about an inch long; stipules oblong, panicles terminal, ramifications rather remote ; flowers rather remote, pedicelled, pretty large ; bractes oblong, one flowered ; calyx five, cleft to the base, divisions oblong, obtuse, villous on the outside, corolla five petalled, petals oval, emarginate, broader but very little longer than divisions of the calyx, filaments from 40 to 50, short, broad, inserted between the petals and the base of the germ, anthers linear with a single filiform beak, germ superior, conic, downy, three celled, cells containing 3 ovules each attached to the top of the axis, style longer than the stamens, stigma acute, pericarpium coriaceous fleshy, oblong, obtuse, one-celled, three-valved, capsule general size about 2½ inches long and 1½ in diameter, seed solitary, of same shape as the capsule.

It is common in the hotter parts of Ceylon, up to an elevation of 2,000 feet, it grows in Canara and all along the Malabar coast : it is found also in Mysore, and in the western provinces of Ceylon, its wood weighs lbs. 26 to the cubic foot, and its timber is said to last 10 years. In Ceylon, its timber is used for packing cases, ceilings, coffins, &c., but on the western coast of India, it is said to be an excellent and valuable building timber, not liable to be attacked by the teredo, and much employed in ship building. Mr. Edye says that the Paini dup-maram is found in the Cochin and Travancore forests, but is rarely cut down, as the dammer taken from it is valuable, and when mixed with the wood oil makes the Paini varnish. This tree produces a resin, in India called copal, in England known by the name of gum anime, and very nearly approaching the true resin of that name. The best specimens are employed as ornaments, under the denomination of amber (kahroba), to which it bears external resemblance. In its recent and fluid state it is used as a varnish, called Piney varnish, in the south of India, and, dissolved by heat in closed vessels, is employed for the same purpose in other parts of India. Another plant of the same genus, V. lanceæfolia, affords a resin from which hindus prepare one of the materials of their religious obiations. This is an article of export to China from Sumatra, where this tree also grows to a height of thirty to fifty feet and from two to four feet in diameter, and in greater abundance than on the coast of Malabar.

When the bark of this tree is wounded, a pellucid, fragrant, acrid, bitter, resinous, fluid, called piney varnish, "pundun," or liquid copal exudes, which, in the rays of the sun, becomes yellow and fragile like glass. It is in this state that it is well known in commerce, and in England receives the name of gum anime, as above noticed. In India it is usually called copal, also East Indian copal. It occurs of all shades of colour, between pale green and deep yellow, and in India the finest pieces are sold, as amber (kahrubah, Arab. Pers.) The resin is used in Ceylon as incense. A solid oil is prepared from the seeds and is called Piney tallow or dupada oil, Piney yennai, Tam, which is used for lamps, for which it is principally used, but is very suitable for soaps and candle making, and might be more largely utilized that hitherto.

The oil from the seeds becomes perfectly solid even in hot climates, and is prepared by cleaning the seeds, then roasting and grinding them into a mass. To 5 seers of seed, add 12 seers of water, and boil until the oil rises to the surface. Remove the oil, stir the contents of the vessel, and allow it to stand until the following day, when more oil will be observed on the surface, which may be collected and the process repeated.

The *Doopada Resin*, which exudes from the Vateria Indica, and constitutes piney varnish, is used as a fragrant incense in temples: the quantity procurable is very considerable. White dammer or Piney resin from this large tree, the Vateria Indica of Linnæus and Wight, the Choloroxylon dupada of Buchanan and Ainslie, exudes spontaneously from the tree and in commerce occurs in large lumps of all shapes and varying in color on the outside from a bright orange to a dull yellow, bearing evident marks of having adhered to the bark of the tree. It has a shining vitreous fracture, is very hard and bears a great resemblance to amber. Its color, internally, is of all shades, from a light green to a light yellow, the green tint predominating in the generality of specimens. It is more soluble in alcohol than the black dammer, and burns with less smoke and a more agreeable odour. It is easily distinguishable from all other Indian resins by its superior hardness, its colour, and amber-like appearance. It is obtained by wounding the tree and in commerce occurs either in small lumps or in large masses, generally of a shining appearance and balsamic smell. It has a very cellular structure, which is attributable to the mode of collection. Notches being cut in the trunk of the tree sloping inwards and downwards, the resin collects in the cavity, and is either permitted to dry on the spot or is collected and dried by the application of heat. It is of all shades, from light green to light yellow or white, and is usually translucent. Specimens are sometimes seen, in which from the dessication having been improperly conducted, the resin is more opaque, of a dull green color, and full of air bubbles, presenting the appearance of having undergone a partial fermentation. This resin may be recognised by its cellular appearance and balsamic smell—this latter, however (which is, of course, due to the volatile oil it contains) is gradually lost by long keeping or constant exposure to the air. What is called " East Indian copal," and sold in England as gum anime, exudes abundantly from this tree. It occurs of all shades of color between pale green and deep yellow; the finest pieces are called kahroba, the Arabic for amber, and sold as amber in the bazars of India: the resin before it hardens is the Piney varnish of Malabar. Besides the uses already alluded to, candles are made of this resin in Malabar, which Dr. Wight informs us, diffuse in burning an agreeable fragrance, give a fine clear light with little smoke, and consume the wick without snuffing. These candles were at one time introduced into England, but a very high duty having been imposed, the trade ceased. Blume, in his Mus. Bot. Lugod. Bat. ii. 29, makes two species of the Linnæan Vateria Indica, reserving this name for the Ceylon plant, and calling the peninsular one V. Malabarica. The Canarium strictum of Roxburgh is known in Malabar under the name of the " black dammer tree," in contradistinction to the Vateria, which is the " white dammer tree."—*Thw. Enum. Pl. Zeyl. M. E. J. R. Roxb. Flor. Indica. Voigt.*

VATERIA LANCEÆFOLIA. ROXB.

Mool of SYLHET.

A large tree, common in Sylhet, and growing in Assam and the Khassya mountains. It has entire, smooth, coriaceous leaves, and terminal panicles of white flowers. It flowers in April and May, and fruits in July and August. It is valuable as a timber tree. It exudes a clear liquid from wounds, &c. in the bark, which soon hardens into an amber coloured resin. From this the natives distil a dark coloured and strong smelling resin called Chooa, also Chova, HIND., the gond or gum, which the brahmins use as an incense. —*Voigt, Royle's Him. Bot., Eng. Cyc. Dr. Mason.*

VATERIA LANCEOLATA. McCLELL.

Pan-they-ya, BURM. | Pan-thit-ya, BURM.

This tree is noticed by Captain Dance, but it may be the same as V. lanceæfolia. He says it is found along the coast near Amherst, and is abundant in Tavoy and Mergui, but scarcely procurable in Moulmein. Its maximum length is 60 feet and maximum girth 6 cubits, and, when seasoned, its wood floats in water. It is often called white thengan, but it is closer and heavier than the thengan. It is, he says, an excellent wood for tool handles and planes, but has not sufficient spring for helves. The Burmese use it for all purposes to which thengan is applied, especially in junks; but the Burmese of Amherst say it is not quite so good or durable as thengan. Dr. Mason also, in his Tenasserim, speaks of a species of Vateria as a common timber tree in the provinces of Tavoy and Mergui. The timber, he says, is whiter than that of Hopea, and equally good. Indeed, it is often, he says, called white thengan or white Hopea, the woods being only distinguished in commerce by their colour. Vateria Roxburghii, when in bloom, is quite ornamental, and diffuses the fragrance of its flowers a great distance around.—*Dr. Wight. Dr. Mason. Captain Dance.*

VATES. LAT. the Bhat or Bard of India.

VATESWARA DATTA, according to some authorities, is the name of the father of Prithu, Prithwi, or Prithivi raja, but by other writers the father was named Someda or Vigraha Deva, and his grandfather Saruga Deva, or Visala Deva. The term datta is also more appropriate to a man of the Vaisya tribe than a Rajput, but then Vateswara is called a samanta, a term especially implying a warrior and a chief, and as in the case of the Jat, the agricultural tribes occasionally follow a military life. These considerations, however, leave the individuality of the author very doubtful.—*Asiatic Researches, vol.* XV.*p.* 407. *Transactions of Royal Asiatic Society, Hind. Theat. vol.* II. *p.* 154.

VATHEK. The hero of the tale by Mr. Beckford, who is made to visit the Takht-i-Jamshid. According to the work called Khalassut-ool-Akhbar, Vathek died of dropsy in the month of Zehuj 232 Hijri, or A. D. 846.

VATICA, a genus of plants of the East Indies, of the natural order Dipterocarpeæ. They are large trees of great economic value. Vatica camphorifera, *Wight*, is the famous camphor tree of Sumatra. V. laccifera, *W. & A.*, grows on the Palghat mountains. V. obtusa, *Wall*, is a tree of Martaban. V.

robusta, *W. & A.*, grows in Nepaul, and V. tumbagaia, *W. & A.*, is a tree of Palghaut.

Saul Tree	ANGLO-HIND,	Sala	,,
Gugilam.	TAM.		

The wood of this tree is in great repute; it is very valuable for house and ship building, is used for vats for liquids, door frames, and the rails and battens of doors ; it is not suited for planks, it twists, shrinks, and warps whenever the surface is removed, even after many years' seasoning, but it is in general use for building purposes in the Ganjam and Vizagapatam districts. Colonel Baker's experiments shew that, compared with teak, its strength is about 1121 to 869. In Major Hay Campbell's experiments on unseasoned saul it broke with 1391 lbs. It is unquestionably, for engineering purposes, the most useful grown India timber. Unseasoned wood broke with a weight of 1308 lbs.; seasoned saul with 1319 lbs. The tree yields ral or dhoonee ral, which contains some essential oils, and is used by hindoos as incense, and in medicine. It is obtained by notching the trees. *Report of R. Thompson Asst. VEATA, a Singhalese long measure, equal to an English foot.—*Simmonds' Dict.*

VEDA. The religious books of the hindoos known as the Vedas, are four in number, the Rig the Yajur, the Sama, and the Atharva, but the last of these belongs to a much later age than the rest. The hymns of the Rich or Rig Veda are repeated entirely in a disjointed form in the Sama, and with little alterations in the Atharva also, while the Yajur Vada contains, principally, forms of prayer. A Veda in its strict sense, is simply a sanhita, or collection of hymns. These hymns form the Mantra or ritual, and are the true Veda. The Rig, the Sama, and the Yajur are the three universally received. The Atharva is of more doubtful authenticity. The body of Vedic literature is immense. In the Brahmana, which are considered as belonging to the Vedas, moral precepts, religious instruction, and information are conveyed. Professor Wilson supposes them to belong to the 8th century before Christ, and they are said to recognise certain grand conceptions of the Supreme Being as the Father to be worshipped, " He the creator of the earth, or He the righteous, who created the heavens. He who also created the bright and mighty waters; is the God to whom we shall offer our sacrifice." The prevailing belief is that the Aryan religion was, in the Vedic times, a worship of nature, which rose to theism and then declined to scepticism and merged into atheism immediately before the time of Buddha. Of the four, the Rig Veda is the oldest, and the Yajur Veda, Sama Veda, and the Atharva Veda follow in succession. Each Veda is divided into two parts, viz., 1st the hymns and mantra, which express the wants and aspirations of the worshippers, and 2ndly the Brahmana, which belong to a ritualistic age, and refer to rites and ceremonies. These are of an unmeaning artificial character, although a mystic significance is attached to each. The Aitareya Brahmana illustrates the brahmanical sacrifices of animals as practised in the early age of brahminical ascendancy, which partly preceded and partly overlapped the age of buddhism.

Good scholars are of opinion that the Vedic hymns were composed mostly about fifteen centuries before Christ, but not committed to writing, and therefore not collected, until the eighth century B. C. With all their difficulties, they furnish much information regarding the origin and early state of some of those races who are now called hindus. The people among whom the Vedas were composed, had evidently passed the nomade stage. They had no money, and their wealth consisted of cattle, horses, sheep, goats, and buffaloes, and the cow was the medium of barter. By the Rig-Veda (vol. 1, p. 165; vol. 2, pp. 127 and 225; and vol. 3, pp. 163, 276, 416 and 453) it is evident that the cow was then not reverenced, and that the race who composed these hymns were a cow-killing, beef-eating, and spirit drinking people. Cow-stealing was a great crime.

Professor Max Muller fixes the years 600 and 200 B. C. as the limits of that age during which the brahmanic literature was carried on in the strange style of the sutra.

The geography of the Vedic hymns confirms the theory that the Arian race migrated from Central Asia about seventeen centuries before Christ, entered India by the north-west, dwelt during the earliest Vedic portion in the Punjab, and migrated or fought their way into Hindustan and Central India during the five centuries that succeeded. From the frequent mention of the Saraswati and other rivers, we learn that the Punjab was at one time the locality of the Vedic Arians. The fathers of the Arians originally inhabited Iran Proper, the Land of Pleasantness, and they left it only in consequence of a convulsion of nature, by which a great alteration in the climate was caused. When the climate was altered by some vast disturbance of nature, the Arians emigrated. They did not, however, follow the course of the Oxus, or they would have come in the first instance to Bactria, and not to Sogdiana. Their course, therefore, was more northerly. Its present climate is precisely what the record in the Vendidad describes it to have been when the changes produced by the above commotion took place. It has only two months of warm weather. In the course of the Arians, after their expulsion from the primeval country between Sogdiana and the Sutlej, they formed, by the conquest of fourteen countries, as many kingdoms in the whole of the eastern part of Central Asia and India Proper, in the country of the Indus and its confluence. In the intervening countries, they passed amongst the Turanians (Scythians and Turcomans), and there is evidence that the inhabitants whom they found in India were likewise Turanians. The main direction of these travellers was southerly, and on the southern bank of the Caspian is a group the nucleus of the Arian Media. Amongst the Arian hindus, the sacrifice of a horse, the Aswamed'ha, seems to have been practised in their religious rites. There are two hymns in the Rig Veda describing the rite, and which leave no doubt that in the early religion of the race, this sacrifice, as a burnt offering to the gods, was had recourse to. It was, even then, however, falling into disuse, and was existing as a relic of an antevedic period, imported from some foreign region, possibly from Scythia, where animal victims, and especially horses, were commonly sacrificed. And, in still later times, the Aswamed'ha consisted in certain ceremonies ending in the liberation of the horse, as throughout nearly all India is still practised with a bull or cow, many of which are met with in every village, freed or let loose in the name of Siva or Vishnu or other hindu god.

The language of the Veda is stereotyped Bactrian, and the Zend tongue is a continuation of the old Bactrian language, with two phases of which we are acquainted. One of these is found in the language of the Zend books, the other is that of the cuneiform inscriptions in use from Cyrus and Darius down to Artaxerxes II. The Sanscrit is the weakened prose form of the old Bactrian language, the poetical form of which exists in the hymns of the Rig Veda. These hymns were transmitted orally. Literature proper only commences with Sanscrit after it became a learned language, and it became the sacred language about the year 1000 B. C. at the beginning of the fourth age.• Both Vedic and Sanscrit were at first living languages.

Professor Muller excludes from the Vedic period, the Mahabarata, Rama'yana, Manu, all the Purana, and all the Sastra and Darsana, and is of opinion that the Vedic age contained four distinct periods, which can be distinguished from each other by sufficient evidence. He calls them the Chhandas period, Mantra period, Brahmana period, and Sutra period. Sutra means string, and was the last production of the Vedic age when the language was bordering on the modern Sanscrit.

Eight out of the ten mandala of the Rig Veda begin with an invocation to Agni. Indra is certainly the most powerful of the vedic gods, but he never enjoys that supremacy which in Greece and Rome was allowed to Zeus and Jupiter. The Rig Veda (iv. 1. 5) says, Come down to us, O Agni, with thy help; be thou near to us to-day, as the dawn flashes forth. The most modern hymn in the Rig Veda must have been composed before the introduction of prose composition, more than 800 B. C.

Brahmans say that there are six members of the Veda, the six Vedanga, which does not mean that there are six distinct books or treatises intimately connected with their sacred writings, but merely the admission of six subjects, the study of which was necessary either for the reading, the understanding, or the proper sacrificial employment of the Veda. These are—

Siksha, Pronunciation
Ch'handas, Metre.
Vyakarana, Grammar.
Nirukta, Explanation of words.
Jyotisha, Astronomy.
Kalpa, Ceremonial.

The Vedas, as explained by different teachers, branch out into innumerable schools, to which different tribes of brahmans in the south of India are hereditarily attached: in upper India every classification of the kind has long been forgotten. A very principal division of the Vedas is that named in the text, the Taittiriya or white portion of the Yajur. It derives its name from Tettiri, a partridge, in which shape, according to the Vishnu Purana, the sage Vaisampayana, the first teacher of the Yajur, swallowed the fragments of this work, which he had compelled his disciple Yajnavalkya, who had offended him, to disgorge. This portion of the Veda was thence named Taittiriya. The legend seems to have been invented by the Puranic writers to disguise their ignorance of the real purport of the designation. Charana is supposed by one commentator to be either a branch of the Vedas, or some particular teacher, and by the other to imply a verse or foot, meaning that they were familiar with the metres of the Veda.

The Vedanta is a school of philosophy or psychology, founded on scattered texts of the Vedas, and thence termed the Anta, or end or substance. The rishi of the Vedas are progenitors or founders of races.

There are three lists of rishi given in the Upanishad of the Yajur Veda, called Vrihad Aranyaka, each list differing from the other. The following are a few names in which the first and second agree.

Atreya (Atri.)
Bharadwaja.
Asuri.
Aupajandhani.
Srawani.
Asurayana & Yaska.
Jatukarnya.
Parasarya or *Parasaryayana.*
Ghrita Kausika,

Eight descents above Atreya we come to the mythological Abhuti Trastvar (Twashtri, the Vulcan of the Greeks) and the Aswini. Four descents downwards from Atreya we reach the Gotama, Bharadwaja, and Parasara, or Parasarya of the hymns. In the last of the lists we find the following order:—Atreyi (Atri), Gautami, Bharadwaji, Parasari, Varkkaruni, Artabhaga, but now removed by at least 40 descents from the devata! many of these however, are not the names of men but of countries. Asuri and Asurayana speak for themselves, as the Assyrians and Assyria. Paras-arya is the Arian Persian, or Parisi. Kausika is from Kaush or Kush in Aria; and as to the Arta-bhaga, Herodotus writes that the Persians originally were called Artoeans, from Arta (Herat): and Bhaga, in the Behistun inscription, means lord or god: so that Artabhaga is, word for word, lord of Arta (or Herat). It will be observed also that Assyria is before Persia in due chronological order. The Vedas allude also to "strong built cities," "perennial cities," "stone-built cities of the Asura;"

The priests are thus enumerated in the text of the Veda—

1. Hotri.
2. Potri.
3. Ritwij.
4. Neshtri.
5. Agnidhra.
6. Prasastri.
7. Ahwaryu.
8. Brahman.

Five classes of men are repeatedly mentioned in the Vedas, but there are no allusions to Sudra or Kshatrya. A like division into four classes prevailed amongst the ancient Persians, the fifth probably being captives enemies and slaves. Arrian makes the number seven; but by taking in or leaving out classes and professions, they could be increased or diminished. The spirit of the Vedas is fiercely intolerant to all of a different faith, or who did not conform to their ritual. The rishi intreat Indra "to strip off their back skins:" but any thing like caste, in its modern sense, it utterly ignores. If such a system as caste had prevailed in those ages, it is impossible that no allusion should be made to it in full five-hundred hymns, outspoken enough on other matters. Although however caste may not have been mentioned in the Rig Veda, it is expressly recognised by the Yajur and other Vedas.

The following tabular statement of the number of sakta in 500 hymns translated by Professor Wilson addressed to each deity sets their actual and relative worship clearly before us;

Indra	178	Mitra	17
Agni	147	Varuna	20
Aswini	28	Usha	11
Marut	24	Sura or Savitri.	5
Vayu	6	Sarasvati	1
Rudra	3	Vishnu, (none in the first *Ashtaka*.)	2
Brihaspati	2		

Total 444. This leaves less than sixty hymns for all the other denizens of their pantheon. They also worshipped "the lights of heaven," possibly the starry firmament. Scholars will recognise this as nothing more or less than the religion of the Persians when they first appear on the stage of history.

Indra takes a very important position in each of the three periods of hindu mythology. In the Vedic period he is the great Being who inhabits the firmament, guides the winds and clouds, dispenses rain, and hurls the thunderbolt. In the Epic period, he is still a principal deity, taking precedence of Agni, Varuna, and Yama. In the Puranic period he is still a chief deity, only inferior in rank to the great triad, Brahma, Vishnu and Siva. His heaven is called Swarga-loka or Indra-loka and his pleasure garden or elysium his city sometimes placed on mount Meru, the Olympus of the Greeks: his charioteer, his thunderbolt, his elephant, his bow (the rainbow) are all famed. In the present state of hinduism, however, in which every hindu has a separate belief, and hero worship, the worship of incarnated beings, devil worship, and the worship of the lingam are the prevailing forms, Indra is unheard of and almost unknown, is now never invoked, and has been succeeded by Vishnu and Siva.

Amongst the earliest dissenters from Indra, were the Yadu race under Krishna's influence. The reasons leading him to the changeare not known, but the Maha Bharata makes him say to Nanda his father, "why worship Indra as Supreme God? O father we are Vaisya and our cattle live upon the pastures, let us therefore cease to worship Indra, pay our devotions to the mountain Govardhana." Up to that time it was to the heaven of Indra that the good who died were believed to proceed.

The two gods, Indra and Agni, Rain and Fire, were the chief deities worshipped by the Vedic Aryans. The sovereign of the gods, Indra, the most powerful of the Vedic deities, was the god of the firmament, the hurler of the thunderbolt, who smote the rain cloud and brought down waters, who delighted in the Soma juice, in eating, drinking, and war, who was strong and drunk with wine. Agni, another Vedic deity, is the personification of fire, and was worshipped as the destroyer of forests, as useful in the sacrifice and in the household.

"When generated from the rubbing of sticks the radiant Agni bursts forth from the wood like a fleet courser." "When excited by the wind he rushes amongst the trees like a bull, and consumes the forest as a rajah destroys his enemies."

"Such as thou art, Agni, men preserve thee constantly kindled in their dwellings, and offer upon thee abundant food." (*Rig Veda* 1, 73.)

Varuna was the vedic god of the waters, and god of the ocean, but the name was sometimes applied to the sun and sometimes used as a personification of day. As with other gods, when addressed, he was regarded as supreme, and capable of forgiving sin:—

"Let me not yet, O Varuna, enter the house of clay; have mercy, Almighty, have mercy!

If I go along trembling, like a cloud driven by the wind; have mercy, Almighty, have mercy!

Thirst came upon the worshipper though he stood in the midst of waters; have mercy, Almighty, have mercy!"

Surya or the sun, called also Savitra, Mitra, Aryaman and other names, was a vedic god, who continues to be worshipped down to the present day by brahmins and zoroastrians. The solar race of Kshetrya, who appear in the Ramayana, derive their origin from the sun: but in the higher spirit, the sun is regarded as divine, as pervading all things, as the soul of the world and supporter of the universe. In a verse of the Rig Veda (iii. 62, v. 10) this idea is supposed to be indicated. It is O'm ! Bhurbhuvăssuvăhā, O'm. Tatsa vit'hru varenyăm. B'hargo dèvassyă dhimahi dhiyo yonaha pracho dăyāth: "O'm! earth, air, heaven, O'm! let us meditate on the supreme splendour of the divinesun, mayhe illuminate our minds:" and, at the present day, the enlightened brahmins regard this verse as an invocation to the several deities who are implored by the worshipper to aid his intellect in the apprehension and adoration of God.

In connection with the sun are the twelve Aditya, sons of Aditi, the universe. In the latter vedic age, they were identified with the twelve signs of the zodiac, or the sun in its twelve successive signs.

Soma, also Chandra, the moon, is chiefly celebrated in the Vedas in connection with the Soma plant, but in the Mahabharata, Soma is the mythical progenitor of the great lunar race of Bharata. The som, soma or somaluta plant, the Sarcostemma brevistigma, *W. et A.* the twisting Sarcostemma, the Hom of the Zend-avesta, often mentioned in the Vedas, obtained its name because it was gathered by the vedic Aryans by moonlight. They carried it to their homes in carts drawn by rams, and a fermented liquor was prepared by mixing its juice, strained through a sieve of goat's hair, with barley and ghi. This wine was drunk at all their religious festivals, and was used as an intoxicant by the rishi, who also at their meals partook of beef. How far this race partook generally of this wine is unknown, but the Rig Veda ix. says in its praise, the "purifying soma, like the sea rolling its waves, has poured forth songs, and hymns and thoughts."

The Aswini, apparently a personification of light and moisture, are alluded to in the Vedas as sons of the sun, also as the sun's rays, and are noticed as the physicians of the gods. They are described as young and handsome and riding on horses.

Vayu or the air, and the Marut as winds, are personified and invoked. The Marut are depicted as roaring amongst the forests and compared to youthful warriors bearing lances on their shoulders, delighting in the soma juice, like Indra, and, like him, the bestowers of benefits on their worshipper.

Ushas, or the dawn, the early morning, the first pale flush of light, is compared to a mother awakening her children, to a loving maiden awakening a sleeping world, to a young married maiden, "like a youthful bride before her husband, thou uncoverest thy bosom with a smile." As a goddess she is styled (Rig Veda I. 2) "the mighty, the giver of light: from on high she beholds all things; ever youthful, ever loving, she comes first to the invocation." Indra, according to Bunsen (iii. 587, 8, iv. 459), is the prototype of Zeus, and was a personification of ether; Soma was offered to him in sacrifice. Indra as the regent of the east, is identical with Devandra, the king of the Deva. The Erythrina fulgens, the Parijata or fairy locks, is supposed to bloom in Indra's gardens, and an episode in the Puranas relates the quarrelling of Rukmini and Satyabhama, the two wives of Krishna, for the exclusive possession of this flower which Krishna had stolen from the garden. The gandharva, in hindu mythology, a shade, a spirit, a ghost, a celestial musician, are demi-gods or angels who inhabit Indra's heaven and form the orchestra at the banquets of the gods. They are described as witnesses of the actions of men, and as sixty millions in number.

The geography of the vedic hymns confirms the theory that the Aryan race migrated from Central Asia about seventeen centuries before Christ, entered India by the north-west, dwelt during the earliest vedic portion in the Punjab, and migrated or rather fought their way into Central India during the five centuries that succeeded. From the frequent mention of the Saraswati and other rivers, we learn that the Punjab was at one time the locality of the vedic Aryans. The Massagetæ occupied precisely that position to which the legends of Mount Meru and its rivers (amongst the rivers the Jaxartes and the Oxus may be clearly traced) point as the cradle of the Aryan race, and the early mention of the Sacæ (Sakya) and Bactrians (Yavana) as the principal foreign nations, confirms the supposition that the Aryan race travelled southwards from the highlands of Central Asia before entering the Punjab. The Aryans of the vedic period were not barbarians or nomades. From the Rig-Veda it is evident that at the time of its composition, the cow was not reverenced, though cow-stealing was a great crime. In the earliest period of their migration, they had no money. Their wealth consisted of cattle, horses, sheep, goats and buffaloes, and the cow was the medium of barter. But there is also mention in their hymns of cities, of commerce, merchants and sailors, of weapons of wood and iron, of chariots, of heralds, of travellers, and inns for their accommodation, and even of the vices of primitive civilization. These immigrants into India, in the time of the Vedas, we are also told, were a cow-eating and spirit-drinking people. From their hymns we learn that they had also roads and ferries, bullock-carts and waggons; they had catriages and war chariots drawn by horses, and the carriage was made of wood with brass wheels and iron rims and pillars. It had seats and awnings, was easy going and sometimes inlaid with gold. Iron and steel were subsequently, at least, in use, for there is mention of iron armour, of arrows tipped with steel, and Porus gave thirty pounds of steel to Alexander. They had a knowledge of the sea; had halls of justice and halls and chambers of sacrifice, but apparently no temples or images. Women held a high social position. The rishi and his wife conversed on equal terms, went together to the sacrifice, and practised austerities together. Lovely maidens joined in processions, and grown up daughters remained without reproach in their fathers' house. But we read of drunkenness, polygamy, cheating, gambling, abandoning of children, thieves, courtezans and eunuchs. Kashivat, an illustrious rishi, married ten sisters at once, and polyandry also prevailed, for in an allegory, Kashivat says, "Aswins! your admirable (horses) bore the car which you had harnessed, (first) to the goal, for the sake of honour; and the damsel who was the prize, came through affection to you and acknowledged your (husbandship) saying, you are my lord." (vol. I. p. 322.)

The Vedas are the earliest sacred writings of the hindus. The Vedas are hymns (Sakta) arranged in books (Ashtaka), that form a ritual. The hymns of the Rich or Rig Veda are repeated entirely in a disjointed form in the Sama, and with little alterations in the Atharva also, while the Yajur contains principally forms of prayer. A Veda, in its strict sense, is simply a Sanhita, or collection of hymns. These hymns form the mantra or ritual, and are the true Veda. The Rig, the Sama, and the Yajur are the three universally received. The Atharvana is of more doubtful authenticity. They comprise various sections, which are again divided and sub-divided under the distinctions of Mantra, Brahmana, It'hihasa, Purana, Upanishad, &c. They were reduced to order by Vyasa, and prescribe the moral and religious duties of mankind. But the books on divine knowledge, called Veda, or what is known, and Shruti, or what has been heard from revelation, are supposed to have been very numerous; and the four here mentioned are thought to have been selected as containing all the information necessary for man. The commentaries on these hindu scriptures, among which that of Vasishtha seems to be reputed the most excellent, are innumerable. From the Vedas are immediately deduced the practical arts of chirurgery and medicine, music and dancing; archery, which comprises the whole art of war; and architecture, under which the system of mechanical arts is included. Next in order to these are the six Vedanga or bodies of learning, three of which belong to grammar; one relates to religious ceremonies; a fifth to the whole compass of mathematics; and the sixth, to the explanation of obscure words or phrases in the Vedas. Subordinate to these Anga (though the reason of the arrangement is not obvious,) are the series of sacred poems, the body of law, and the six philosophical Shastra. The first Indian poet after Vedic times was Valmiki, author of the Ramayana, a complete epic poem on one continued, interesting, and heroic action; and the next in celebrity, if it be not superior to it in reputation for holiness, is the Mahabarat of Vyasa. To Valmiki are ascribed the books subsequent to the Vedas, the sacred Puranas, which are called the Eighteen, and which have the following titles:—1 Brahm, or the great one; 2. Pedma, or the Lotos; 3. Brahmanda, or the Mundane Egg; 4. Agni, or Fire—(these four relate to the creation); 5. Vishnu, or the Preserver; 6. Garuda, or his Eagle; 7. the transformation of Brahma; 8. Siva; 9. Linga; 10. Nareda, son of Brahma; 11. Scanda, son of Siva; 12. Marcandeya, or the immortal man; 13. Bhawishya, or the prediction of futurity—(these nine belong to the attributes and powers of the deity); 14. Matsya; 15. Varaha; 16. Kurma; 17. Vamana, or as many incarnations of the Great One in his character of Preserver, all containing ancient traditions embellished by poetry or disguised in fable. The eighteenth is the Bhagavata, or life of Krishna, with which the same poet is by some imagined to have crowned the whole series; though others, with more reason, assign them different composers, and they are differently arranged and named by other authorities.

Of the philosophical schools it will be sufficient here to remark, that the first Nyaya seems analogous to the Peripatetic; the second, sometimes called Vaisishica or Vaiseshka to the Ionic; the two Mimansa, of which the second is often distinguished by the name of Vedanta, to the Platonic; the first Sanchya, to the Italic, and the second, or Patanjala, to the Stoic, philosophy; so that Gautama corresponds with Aristotle, Kanada with Thales, Jaimini with Socrates, Vyasa with Plato, Kapila with Pythagoras, and Patanjali with Zeno; but an accurate comparison between the Grecian and Indian schools would require a considerable volume. The original works of those philosophers are very succinct; but like all the other shastra, they are explained, or obscured by Upadarsana, or commentaries, without end. It results, from this analysis of hindu literature, that the Veda, Upaveda, Vedanga, Purana, Dharma, and Darshana, are the six great shastra, in which all knowledge, divine and human, is supposed to be comprehended. The word Shastra, derived from a root signifying to ordain, means generally an ordinance, and particularly a sacred ordinance, delivered by inspiration properly; therefore, the word is applied only to sacred literature. The shudra, or sudra, or fourth class of hindus, are not permitted to study the six proper shastra before mentioned; but an ample field remains for them in the study of profane literature, comprised in a multitude of popular books, which correspond with the several shastra. All the tracts on medicine must, indeed, be studied by the vaida, or hereditary physicians, who have often more learning, with far less pride, than any of the brahmans; they are usually poets, grammarians, rhetoricians, moralists, and may be esteemed, in general, the most virtuous and amiable of the hindus. Every Purana treats of five subjects: 1, the creation of the universe; 2, its progress and the renovation of worlds; 3, the genealogy of gods and heroes; 4, chronology according to a fabulous system; and 5, heroic history, containing the achievements of demi-gods and heroes. Since each Purana contains a cosmogony, with mythological and heroic history, the works which bear that title may not unaptly be compared to the Grecian theogonies. This description is applicable to the eighteen mythological poems called Purana, not to certain passages of each Veda, bearing the same name of Purana, and interspersed throughout that portion of the Vedas entitled Brahmana, or divine precepts. In the Brahmana, moral precepts, religious instruction and information are conveyed. The body of Vedic literature is immense. Professor Wilson supposes the Vedas to belong to the 8th century before Christ, and they are by some said to recognise the institution of caste or at least of social distinctions from which this institution has arisen. Very little is known of the Puranas which are less interesting than the Sanhita, as being of later date. The Brahmana are chiefly liturgical and legendary, and in the Upanishad, passing into the rationalized state, and becoming metaphysical and mystical. It would be difficult to find two sets of opinions more absolutely irreconcileable than Vedic hymns and Vedautic philosophy. The Shutra (aphorisms) or Brahmashutra, the chief authorities of the pantheistic Vedanta school, though much later than the rest, are still mnemonics, as also the Vaiseshka or atomic school of Kanada. This supplementary mass of Vedic literature, including philosophy, commentaries, aphorisms, &c., might furnish occupation for a long and laborious life. The Rig-Veda Sanhita is the oldest book known to the hindus, and certainly one of the oldest books in the world. Each hymn is called a Sakta, of which there are about a thousand, arranged into eight Ashtaka or Khanda, of unequal extent. Another division is into ten Mandala, sub-divided into a hundred Anuvaka. Each hymn has a Rishi or inspired writer for its author. The deities which this Veda invoke are elemental, *i. e.*, personifications of earth, fire, and water, and the winds, &c. In the 3rd Ashtaka, Agni has 44 hymns addressed to him; the next to him in number comes Indra with 48, and after them the Marut or the winds have the largest number of hymns. The Rig-Veda is the first, and the chief of the four Veda, the others, the Sama Veda, Yejur-Veda, and the Atharvana Veda, come after it. These four form the Sanhita or text. The Sanhita itself, with the hymns it embodies, forms the mantra or ritual.

The language of the Vedas is not Sanscrit in the strictest sense of the term, but there is not sufficient difference between it and classical Sanscrit to authorise its being called a separate language. The difference is not so great as between Anglo-Saxon and modern English, but it is greater than between the Greek of Homer and Demosthenes. The names of the rishi or composers are not always given in the body of the hymns, and there is nothing to guide the historian or chronologist as to their dates. Nevertheless, good scholars are of opinion that Vedic hymns were composed mostly about fifteen or seventeen centuries before Christ, but not committed to writing, and therefore not collected until the eighth century B. C. With all their difficulties, they furnish much information regarding the origin and early state of some of the races who are now called hindus. The people among whom the Vedas were composed, had evidently passed the nomadic stage. They had no money, and their wealth consisted of cattle, horses, sheep, goats and buffaloes, and the cow was the medium of barter. But a comparatively small portion of the Vedas has ever been translated, nor is it ever likely that the whole mass of Vedic literature will ever see the light in a modern language. Portions of the Rig Veda have been translated by the late F. Rosen, the late M. Longlois, and by Pofessor Wilson, whose labours have given us four Ashtaka, containing 502 hymns. And Dr. Muller undertook to produce a complete one at the expense of the E. I. Company. The 3000 pages of large quarto which had appeared, embrace little more than half the Sanhita with Sayanan's Commentary. Indeed, Roth calculated that the mere Sanhita or metrical portion of the Vedas, as distinguished from the Brahmana or later ritual appended to each, contains not less than 30,000 couplets, of which 11,000 go to the Rig-Veda. In the splendid edition of this book which, as has been mentioned, Professor Max Muller was producing at the expense of the E. I. Company, little more than half the Sanhita, with Sayanan's commentary, occupied scarcely less than 3,000 pages of large quarto. There has been printed the first volume of the late Professor Wilson's translation of the Rig-Veda Sanhita. If the language seems prosaic for hymns, and the style altogether more adapted to the huge quarto translation of the Vishnu Purana, it has been stated by a reviewer that the diction of the Vedas is by no means difficult to turn into elegant and even poetic English, and he proves this by the following fresh and animated description of the early dawn :—

" Westward she goes as a brotherless maiden seeks the men of her kin ;
And as one mounts the hall of justice to recover stolen goods ;
Like the wife that yearns to charm her spouse, Dawn decks herself in pleasing garb, and smiling, as it were, displays her charms."
"The youthful dawn approaches from the East;
She yokes her team of purple oxen. 'Dawn, like a barber, shears the thickened gloom ;
And bares her bosom as the cow her udder yields ;
And as the cattle hasten to the lea, she westward speeds,
And shedding brilliance o'er all the earth, drives back the night."

It is said to be quite possible to give the literal sense and even the proper order of the words, and yet retain the spirit and warmth of the original ; and as a proof of this, the following version is given of one of the most spirited hymns which has yet been published in English. It describes the contest of Indra, the lord of thunder, with Vritra, otherwise called A'hi, the personification of the rain-cloud ; and those who know how important rain is to many countries like India, can well appreciate the joy that welcomes descending showers upon the parched and heated fields, and understand how the cloud which is supposed to imprison the waters, is regarded as a demon, while the lightning that cleaves it, and sets them free to descend on earth, is worshipped as a beneficent deity.

" Of Indra now, the ancient mighty deeds, which he, the thunderer, achieved, I sing.
The cloud he slew, then spilled the waters. He broke (channels) for the mountain streams.
He slew the cloud that slunk back to the mountain. Twashtri had made his rattling bolt for him,
As to their calves do cows, the flowing waters hurried to the sea.
Like a bull, he sought the Soma. At the triple rites he drank it as 'twas poured.
Maghavan seized his shaft, the thunderbolt ; he struck that first-born of the clouds.
When, Indra, thou hast slain the first-born of the clouds, then hast thou destroyed the deceptions of those deluders.

The sun and sky and dawn producing, thenceforward found'st thou not a foe at all.
Indra struck the cloudier cloud-god, maimed with his bolt with mighty blow,
As tree-trunks felled by the axe, A'hi lies stretched upon the earth.
Like a warrior, malignant, Vritra challenged the great hero, destroyer of many, slaughterer of his foes.
He has not escaped the contact of these slaughters. Indra's foe has crushed the river (banks).
Footless and handless, Indra he defied. He struck his thunder-dint upon his upper side.

As an eunuch desiring to be like a man, Vritra lay bereft of many limbs.
As from a river of broken banks, the waters, bringing joy to the heart, flow o'er him lying there.
At the feet of the waters which Vritra in his might imprisoned, lies A'hi stretched.
The mother of Vritra lay across her son's (body.) Indra on her brought down his weapon.

The mother was above, the son below. Danu lay as a cow with her calf.
O'er the nameless corpse of Vritra, cast in the midst of restless never ceasing waves,
The waters pass. The foe of Indra lay in lasting gloom.
The waters, the wives of the destroyer, had stood restrained, guarded by A'hi, like the cows by Panin.
Indra, having slain Vritra, has opened the cavern which confined them.
Like a horse's tail wast thou, Indra, with thy thunderbolt, when he alone, resplendent, struck at thee again.
Thou hast won the kine. Thou hast won, O hero, the Soma juice. Thou hast sent down the seven rivers to flow.
Not the lightning, not the thunder, not the rain which he poured, nor the thunderbolt, reached Indra,

When he and Vritra fought. Even in other (fights) was Mahavan victorious.
What, slayer of A'hi, didst thou look for Indra! when fear entered thy heart, about to slay him,
And nine and ninety streams, like frighted hawk, thou fled'st across?
Indra, bearing the thunderbolt, (became) king of the moveable and immoveable, of tame and of horned beasts;
Thus he dwells the king of mortals. All those things he comprehends, as does the wheel its spokes."

At page 84 Professor Wilson gives a translation of the same hymn in the 32nd sakta, of which the following extracts of the opening stanzas are given for the sake of comparison: —

"I declare the former valorous deeds of Indra, which the thunderer has achieved: he clove the cloud; he cast the waters down (to earth); he broke (a way) for the torrents of the mountain.

He clove the cloud, seeking refuge on the mountain: Twashtri sharpened his far whirling bolt: the flowing waters quickly hastened to the ocean, like cows (hastening) to their calves.

Impetuous as a bull, he quaffed the soma juice: he drank of the libations at the triple sacrifice. Maghavan took his shaft, the thunderbolt, and with it struck the first-born of the clouds.

Inasmuch, Indra, as thou hast divided the first-born of the clouds, thou has destroyed the delusions of the deluders, and then engendering the sun, the dawn, the firmament, thou hast not left an enemy (to oppose thee).

With his vast destroying thunderbolt, Indra struck the darkling mutilated Vritra: as the trunks of trees are felled by the axe, so lies A'hi prostrate on the earth."

Professor Wilson's prose translation is of value to the student ignorant of Sanscrit, who would naturally look with some suspicion upon poetical versions.

If, as is supposed, the Vedas were composed about seventeen centuries before Christ, but not reduced to writing till the eighth century, this would have admitted of much new matter being introduced when the traditions were first recorded. And a striking difference has been observed between the mythology of the Rig Veda,. and that of the heroic poems, the Mahabharata and Ramayana, and the Puranas. Some of the divinities worshipped in Vedic times are not unknown to later systems, but at first perform very subordinate parts, whilst those deities who are the principal objects of worship of the present day, are either wholly unnamed in the Vedas, or are noticed in an inferior or different capacity. The names of Siva, of Mahadeva, of Durga, of Kali, of Rama, of Krishna, so far as research has gone,do not occur in the Vedas. The practice of the conquered races seems to have been to represent or regard their local deities as identical with avatars or incarnations of the vedic chiefs, who had already become objects of worship. The Vedas mention Rudra as the chief of the winds, collecting the clouds as a shepherd's dog does the sheep, and attending on his master Indra. The most that can be made of Rudra in the Vedas is as the father of the winds, and seemingly a form either of Agni or Indra. Even in the Puranas he is of a very doubtful origin and identification; but in the present day, everywhere amongst the hindus he is identified with Siva, of whom an early notice, about the year 800 B. C., is to be found in Ch. V, v. 26 of the Book of Amos, where Siva is styled Chiun, a usual pronunciation in India even of the present day. "But you have borne the tabernacle of your Moloch and Chiun, your images the star of your god, which you made to yourselves." In the Vedas, however, with the single exception of an epithet 'Kapardi,' with braided hair, of doubtful significance and applied also to another divinity, no other term applicable to Siva occurs, and there is not the slightest allusion to the form in which, for the last ten centuries at least, he seems to have been almost exclusively worshipped in India, that of the lingam, priapus or phallus: neither is there the slightest hint of another important feature of later hinduism, the trimurti, or triune combination of Brahma, Vishnu and Mah'eswara or Siva, as typified by the mystical syllable O'M. (a-u-m) although, according to high authority on the religions of antiquity (*Creuzer, vol.* i. *pp.* 26 *&* 27.) the trimurti was the first element in the modern faith of the hindus, and the second was the lingam. In this view Creuzer must have intended the mixture of creeds now current in India; for the old vedic faith had few of the elements of modern hinduism.

Of two of the gods whom the vedic hindus worshipped, Indra and Agni. Indra was the firmament, with all its phenomena. He alone held the thunderbolt, and was king over gods and men. Agni was the element of fire. All the other gods were but manifestations, or other forms, of these two. The relationship is evident between Agni and the Sun, the Surya or Sura, or Savitri of the Vedas, and a female divinity. But Indra also is frequently identified with the Sun; indeed the twelve great deities or Aditya, are but other names of the same god as presiding over the twelve months of the year. It seems strange in the face of so significant an inference, that some of the best oriental scholars, including even the iconoclast Bently, agree in affirming that the division of the Zodiac into twelve signs was long posterior to the time of the Vedas, and that the rishi were familiar with the 27 nakshatra. The Aditya most frequently invoked are Mitra, Varuna, Aryaman, and in a lesser degree Pushan, Bhaga, Vishnu and Twashtri. There is some discrimination in these attributes: but on the whole they are pale and colourless. Pushan watches over roads and travellers, Twashtri is the Vulcan or 'smith' of the gods. Slight mention is made of Vishnu: but we have the germ of the legendary 'three steps' being, apparently, simply the rise, culmination, and setting of the sun. Among the inferior deities, the Marut, or winds, hold the first place; and next to them, or nearly on the same level, the Aswini. These are two, apparently twins or brothers, and sons of the sea (Sindu). Sometimes, as Dr. Wilson notices, they seem to be the 'precursive rays of the sun,' at other times, perhaps, the sun and moon as rising out of the sea; so that the vedic hindus evidently had settlements on the sea coast or on some water, which they called a sea. The Aswini are almost invariably represented as having a triangular car with three wheels, drawn by asses; while their name appears to be derived from "*aswa*," a horse, which would seem to identify them with the two horses of the sun. Altogether they are a perplexing pair: and the sakta addressed to them are richest of all in legend. Their connection with Indra (Jupiter), their patronage of mariners, their twin brotherhood, the two horses and stars found on their coins, identify them with the Grecian Dioscuri, and add much strength to the theory that the Greeks were an Aryan or Persian tribe originally, as their language indisputably proves. The legend of Perseus is another link in the chain. It is singular to find an exceptional and eccentric worship prevailing in countries so remote as India and Greece, while it had died out (if it ever existed) among the parent stock in the vast regions between. It can scarcely be doubted that the Aswini are connected with the primitive hindu astronomy. In the Vedas, heaven, earth, (Aditi and Pritivi) and ocean, are rarely invoked, and the sun has comparatively few sakta. Occasional laudations are given to rivers, especially to Saraswati; and this nature-worship extends so largely as to embrace the cow, the wood used in the oblations, and even the "yapa," or sacrificial post. To Usha, or the dawn, some of the most beautiful hymns in the Veda are addressed. All these deities are expressly declared to be the progeny of the heavens and the earth. (*Wilson's Vedas*, vol. I. p 276). No mention is made of the planets: for Bruhaspati is not a planet, but 'the lord of prayer:' and the moon has not even a sakta. The worship of the Vedic race is briefly but comprehensively described by themselves, (*Asht. I, Adhy. I, Sukta* 6), where it is said, the standers around associate with (Indra) the mighty (sun), the indestructive (fire), the moving (wind), and the lights that shine in the sky.

Aphorisms or Sutra were the usual mode of instruction followed in the hindu liturgical books—the Vedas. They were adopted in the fourth period of the Aryan hindu progress, about B. C. 1,000, and in the Sutra, the ceremonial prescriptions were reduced to a more compact form and to a more precise and scientific system. The Aphorisms of the Nyaya Philosophy, of the Minansa and Yoga, were reprinted in Sanscrit and English by Professor James Ballantyne of the Benares college.

Only a small portion of the Vedas is generally read among brahmins: it is read without the meaning being explained, and is in obsolete Sanscrit. The great rite or sacrifice called yajna is, though very rarely, celebrated among the smarta brahmins. The few brahmins who live by the Vedas commit to memory twenty or thirty chapters, which are recited at certain ceremonies in weddings, funerals, and yajna. Of these they never pretend to know the meaning. Ordinary brahmins, though taught a few pages of the Vedas at school, are not expected to retain this knowledge. From the best information it would seem that not ten brahmins might be found throughout the peninsula who are really skilled in the Vedas. Those recluses who study divinity read various commentaries called Bhashyam. The smarta brahmins read the Sancara Bhashyam. The vaishnava read the Ramanuja Bhashyam, and the Madhava read the Madhava Bhashyam, each man reading the commentator approved by his sect. The jangam sect are in all respects opposed to licentiousness, which is the main spring of the Tantra. The jangam came from the west, Tantrica from the north. The Jangam adore the linga and abhor the Goddess of Delusion (Venus or Kali, as Deos), who is expressly the the goddess (Yoni, or Bhaga Malim) of the Tantrica. The Tantrica take no notice of the lingam. They adore Betula (the devil) and other malevolent powers. The jangam honour Siva as Daxina Murti, or the beneficient and loving deity. The Tantrica say they aim at a perfect release from fleshly lusts. The Jangam do the same, but the former pretend to yield to their passions as the path to freedom, whereas the jangam or vira saiva call on their votaries to deny themselves in all respects. In practice, however, the vira saiva hold women to be inferiors, and their licentiousness is great.

It has been remarked that in the first 500 hymns of the Vedas, we can discover the eastern and southern boundaries of the Arian races at that time. Among the enemies whom they subdued by the help of Indra, we find the Arbuda, supposed by all scholars to be Mount Aboo, on the Aravali Hills. Also Kutsa, by the help of Indra, destroyed a robber chief named Kaya (va), whose country near the Sipha was between the Anjasi, Kulisi and Verapatni rivers. (*Vol. I. p* 268.) A town still called Kaya exists, and in its vicinity are the Sipu, Bunas or Banas, and Kalindi rivers, thus identifying the locality of Kuya (va) as close to Arbuda or Aboo. But the localities further south, viz., Oojein, Chittore or Udipore, the river Chumbul and the Nerbudda seem not to have become known to them then. Of the north, however, notices occur of the Jumna, Sarjju, Gumti, and one allusion to the Ganga. There is fighting on the Sarjju between Arian chiefs, but their silence as to the great Ganges, shows that it was, as yet, personally unknown to them, or that they had only encountered it in its northern course. They were occupants of Kashmir, the valley of the Punjab, Sind, Guzerat, and even perhaps near to Delhi, but the kingdoms of Magadha and Mithila and Ayodhia, were not then known, or were not founded. The seat of vedic power and learning, when at its zenith, was between the Jumna and the Indus. and all to the east of Delhi or Indraprestha, or that lay north of the 28th parallel of latitude, was unknown to them. Later, in the time of Seleucus, their territory had come down to Patna. But their discovery of the great Ganges was later than the Vedas, which only allude to the Sindu, Saraswati, and the Drishadavati (Kaggar.)

The religion of the Aryans, as shown in the Vedas, so far as we are acquainted with it, differs in many very material points from that of the hindoos of the present day. The worship they prescribe is, with a few exceptions, domestic, consisting of oblations to fire, and invocations of the deities of fire, of the firmament, of the winds, the seasons, the moon, the sun, who are invited by the sacrificer, if a brahmin, or by his family priest, if he is not a brahman, to be present, and accept the offering, either oiled butter or the juice of the soma, Sarcostoma brevistigma, which are poured upon the sacrificial fire, in return for which they are supplicated to confer temporal blessings upon the worshipper, riches, life, posterity;—the shortsighted vanities of human desire, which constituted the sum of heathen prayer in all heathen countries.

The following is the second hymn of the Rig-Veda :

1. Approach, O Vayu (deity of the air); be visible : this soma juice has been prepared for thee ; approach, drink, hear our invocation.

2. Those who praise thee, Vayu, celebrate thee with sacred songs, provided with store of soma juice, and knowing the season suitable for their oblations.

3. Vayu, thy assenting voice comes to the sacrificer ; it comes to many through the offering of the libation.

4. Indra and Vayu, this juice has been prepared ; come with benefits for us ; verily the libation desires you.

5. Vayu and Indra, observe the libations, being present in the offerings, come quickly.

6. Vayu and Indra, mighty men, approach the priest of the sacrificer quickly, on account of his prayers.

7. I invoke Mitra (the sun) the source of purity ; I invoke Varuna, able to destroy ; both cherishing earth with water.

8. Mitra and Varuna, be pleased with this propitiatory offering ; for to you, assuredly, do sacrifices owe their success, as the waters do their abundance.

9. Mitra and Varuna, all wise divinities, formed for the benefit of multitudes, and multitudinously present, give efficacy to our acts.

The Anga and Upanga, *i. e.*, the sciences and secondary sciences subordinate to the Vedas, are usually called Vedanga. Six principal ones are enumerated, viz. :

1. Pronunciation.
2. Description of religious ceremonies.
3. Grammar.
4. Metre.
5. Daily calendar.
6. Explanation of difficult words, (etymology.)

It seems very doubtful if at the time of the composition of the Vedas, idolatry was practised. In India, images of the deified elements are even now unworshipped, and except images of the sun, they are never made. The personification of the divine attributes of creation, preservation, and regeneration, Brahma, Vishnu, and Siva, which are now almost exclusively recognized, originated no doubt with the Vedas, but they are rarely named —they are blended with the elementary deities, they enjoy no pre-eminence, nor are they ever objects of special adoration. There is no reason, from the invocations addressed to them in common with the air, water, the seasons, the planets, to suppose that they were ever worshipped under visible types. Ministration to idols in temples is held by ancient authorities infamous; Manu repeatedly classes the priest of a temple with persons unfit to be admitted to private sacrifices, or to be associated with on any occasion, and, even still, the priests who attend upon the images in public are considered as of a scarcely reputable order by all hindus of learning and respectability. The worship of images is declared to be an act of inferior merit even by later authorities, those perhaps with which it originated, and it is defended only upon the same plea which has been urged in other times and other countries, that the vulgar cannot raise their conceptions to abstract deity, and require some perceptible object to which their senses may be addressed. "Corresponding to the natures of different powers and qualities," it is said, "numerous figures have been invented for the benefit of those who are not possessed of sufficient understanding." And again: "The vulgar look for their gods in water; men of more extended knowledge, in the celestial bodies; the ignorant, in wood, brick, and stones." It is almost certain, therefore, that the practice of worshipping idols in temples was not the religion of the Vedas. The dwelling house of the householder was his temple: if qualified, he was his own priest; but this practice even among the brahmans, probably soon fell into desuetude, as they more extensively engaged in secular avocations, and it became almost universally the practice to retain a family priest. This is still the custom. Instead, however, of being a brahman of learning and character, he is very commonly illiterate, and not always respectable. The office has also undergone an important modification. The family priest was formerly also the guru, or spiritual adviser of the family. The priest now rarely discharges that function; he merely conducts the domestic rites; and the guru, to whom extravagant deference, such as is due to deity alone, is paid, is a very different individual, very usually not a brahmin at all, but a member of some of the mendicant orders that have sprung up in comparatively modern times, a vagrant equally destitute of knowledge, learning, and principle.

In many parts of India, the Vedas are not studied at all, or are so merely for the sake of repeating the words, the sense being regarded as a matter of no importance even by the brahmin who recites or chants the expression. Of the four Vedas, the Rig-veda, the Yajur-veda, the Sama-veda, and the Atharva-veda, the Rig-veda is the most important. It consists of metrical hymns or prayers termed sukta or mantra, each stanza of which is called a "rich," addressed chiefly to the gods of the elements, and especially to Indra the god of the atmosphere, and Agni the god of fire. The composition of the principal mantra of the Rig-veda is supposed to have taken place about thirteen centuries before the Christian era.

Much connected with the natives of India of ancient days will never be known, but the powerful branch of the Arian race who passed into India between the fourteenth and eighth centuries before Christ, brought with them the language of the Vedas, and down to the present day, all brahmins profess alike to recognise the authority of these sacred books. We witness worshippers of Siva and Vishnu, and the maintainers of the Sankhya or Nyaya doctrines, considering themselves, and even each other, to be orthodox members of the hindu community. It is this common recognition of that one set of religious books which is the sole bond of union amongst the descendants of the various races and tribes professing hinduism or brahminism, who now people India. The Atharavana or Athara-veda, or Atharva Veda, the fourth of the Vedas, comprehends the whole science of hindu theology, metaphysics, and philosophy.

The Vedas throw little light upon the strange theology and most eccentric tenets of the present hindus. Besides being unable to find in the Vedas the true origin of caste, there cannot be found in them the primitive forms of the hindu triad, the source of the doctrine of metempsychosis, nor that combination of polytheism and pantheism which ought to have preceded the schism of the philosophical schools from orthodox brahminism. For centuries, the brahmins appealed to the Vedas as their authority for every error and malpractice which they maintained, and met the arguments of Europeans by referring to those books, which were always quoted in support of every doctrine and every practice, and to confound an opponent. It has been conceded that the laws of Menu, though excellent and authoritative in one age, were not binding in all; but the universality of Vedic precept was always insisted on, and it was said that if a principle were not found in those books it would not be adhered to. Upon these grounds, now that the contents of the Vedas are known, all the institutions, social as well as religious, of modern brahminism, might be overthrown, and in this respect, no labour has possessed such value as that given to the interpretation and criticism of those works which the present hindus assert to have proceeded from the mouth of Brahma himself. The study of the Vedas and Puranas by the hindoos would serve to dissipate much of the mysterious awe with which they have looked on these books. The more the hindoo may read, the less respect could he feel for them. Not only is the divine origin claimed for them at once refuted by the very ordinary characters which distinguish them as peculiarly mortal, but they are not even all of them on sacred subjects. In one place we have an erotic dialogue of a loose description between a man and his wife; in another, an address to food; in another, a gambler complains of his ill luck. In one the hawk, in another the sacrificial pole, in a third the Francoline partridge, in others even the mortar and pestle, and the wheel-barrow, in which the victim is brought to the sacrifice, are the subjects of laudation.

In the later hymns of the Vedas there can be traced the origin of the Vishnu worship and the setting aside of Indra. But the foreign Mahadeva and Bhavani came in with the Sakæ, and mingled in their worshippings until the doctrines of Buddha, himself a Sakyan, were promulgated, and held their own for nearly a thousand years, until Vishnu, Brahma, Siva, Durga, Kali, Rama, Krishna, Ganesa, Kartikeya, and a host of new divinities, prevailed about the 8th or 9th century of the christian era, over a better faith than their own, and up to the present day, enslave and degrade the hindu.

In the early times represented by the Vedas, in the songs of the Rig-Veda, there is little of philosophy,—mystic tendencies are little developed; but the wars of kings, rivalries of ministers, triumphs and defeats, war-songs and imprecations, occasionally occur. The active side of life is still prominent in the genuine poetry of the several rishi, and there still exists a certain equilibrium between the two scales of human nature. It is only after the Arian tribes had advanced southwards, and taken possession of the rich plains and beautiful groves of Central India, that they seem to have turned all their energies and thoughts from the world without them to that more wonderful nature which they perceived within. Such was their state when the Greeks first became acquainted with them after the discovery of India by Alexander.

The four classes of priests required by Vedic service had their distinct duties assigned, and rules were adopted to assist them in the punctilious discharge of even the most minute services. The "Adhvarya," aided by the ritual prescribed in the Yajur Veda, prepared the place of ceremony, provided the materials, led up the animal, sacrificed it, and performed all the harder labour, muttering as they proceeded, the usual invocations. The "Udgatri," directed by the Sama Veda, sang the sacred hymns. The Hotri, acquainted with the whole, as taught in the Rig Veda, recited at the appointed times, in loud, clear tones, the holy texts, invocations, and prayers; while the brahmin superintended the whole, watched that mistakes were corrected, and saw that the entire rites were performed in due order. On all these topics explanations arose, minute directions were given, and as time went on, and the original import of particular ceremonies and sacrifices became lost, other explanations, even of the most puerile kind, were suggested, confirmed, and adopted. For instance, the great sacrifices, the *Aswamedha* and the *Purushamedha*, in which no doubt at first, in the early history of the race, horses and men were literally sacrificed, entirely changed their character.

An artificial system of expressing the largest amount of knowledge in the fewest possible words was invented, and seems to have been received with enthusiasm. The brief aphorisms so formed were termed sutra.

The emigration of the brahmins southwards into Peninsular India appears to have been subsequent to the first great change in their religious system. The religion they introduced was probably a rudimental form of saivaism, with a tendency to the mystical and mythological system of the Puranas. There is not the least reason to suppose that the Vedic or elementary system was ever known in the Tamil country either as an indigenous religion, or as introduced by the brahmins. The brahmins were doubtless the civilizers of the Tamil people; and the traditional leader of their migration, Agastya, is said to have reduced the Tamil language to order and to have given it a grammar; yet not one of the old Tamil names of the elements, the heavenly bodies, or the operations of nature, is masculine or feminine, as they are in Sanscrit, in accordance with the elementary doctrines of the Vedas; and there is not the least trace of the elements, or powers of nature, having at any time been considered as personal intelligences. The inventors of both the Vedic and the demonolatrous systems seem to have been equally destitute of moral sentiments. Each adored power not goodness, operations not virtues; but whilst the former deified the operations of nature, the latter demonized the powers of heaven. It appears very inprobable that demonolatry originated in any form of brahminism, though it may be true that from time to time, especially after the lapse of elementary worship into mysticism and of hero worship into terrorism, a few brahminical ideas have been added to the demonolatry of the Shanar race, and a few of the demons who were formerly independent may have been taken into the service of the petty divinities. There are traces amongst the Shanar of a vague traditionary belief in the existence of a god: but the term in use also signifies ruler or lord, and they ascribe to him the punishments which overtake the wicked; monstrous births, and prodigies, and on the death of a child, they abuse him for his want of mercy and blindness in slaying the infant. Hence it may be inferred that they regard the ruler or lord as the author of life. Their literature is either of brahminical origin, or it is confined to the recital of the praises of demons, the power of incantations, and the virtue of medicines. They nominally acknowledge as deities some of he braminical mythologies, but they know only their names and a few popular myths or deified heroes. Dr. Caldwell, with one exception, has not discovered the least vestige of their acquaintance with the pantheistic notion so popular with Tamil poets, that God is an all pervading essence without qualities or acts.

The races occupying India, who are now known to Europe as hindoos, have had three great changes in religion. The Vedic age was prior to the absorption of the Saraswati river into the sand. The brahminic age extended from that time to about B. C. 600. The buddhist doctrines prevailed from B. C. 600 to A. D. 800 or 1000, from which date, A. D. 800 or 1000, the brahminic doctrines have, again, prevailed up to the present time.

Indra is worshipped in the south of India in the Pongul or boiling. Pitri, in brahminism, the soul of a deceased ancestor. A recent writer in the *Calcutta Review* remarks that the history of the Arian immigrants whilst in the Punjab, is to be found in the Vedic hymns, which scholars are of opinion were composed mostly about fifteen centuries before Christ, but not committed to writing, and therefore not collected until the eighth century B. C. With all their difficulties, these hymns furnish much information regarding the origin and early state of a race who have exercised a great influence on the other peoples who, along with themselves, are now designated hindus.

The Rig Veda is supposed to have been composed about the twelfth or fifteenth century before Christ, and would therefore synchronize with the Hebrew conquest of Canaan, but some of the hymns have been earlier, some later. Their most famous commentator was Sayana Acharya, who flourished about the fourteenth century of the Christian era. The Veda language is the oldest east Iranian.

The At'harvana Veda is the fourth of the books termed Veda, but is supposed to be a composition of much later date than the other three, as its language is less obsolete than theirs. Self-imposed obligations are in constant practice amongst the hindus. It appears to have been customary for the ancient princes of the hindus, when enfeebled by years, to transfer the crown to their successor and retire to a hermitage. It has been not an uncommon practice with the princes of India, when satiate with years and power, or disgusted with the world, to become ascetics, and hermits. The Ajur Veda treats on the science of life, medicine; Dhanur Veda on archery; Gandharba veda on music.—*Hind. Th. vol.* 1. *p.* 300. *Wheeler's Hist. of India, p.* 11. *Wilson's Religious Practices and Opinions of the Hindus, p.* 9, 10. *William's Story of Nala. North British Review. Muller's Hindu Philosophy, p.* 30. *C. P. Brown on the Creed, Customs, &c. of the Jangams, p.* 11, 17. *Calcutta Review.* See Arian; Hindu; Siva; Veda; Vidya.

VEDACHARI. SANS. from vedu, and charin. practice.

VEDAGU, of RHEEDE. Æschynomene sesban.

VEDALA CHETTU. TEL. Gærtnera racemosa, *Roxb.*

VEDAN, also styled Vedar, Veddah, Bedan, Veddar, Beder, and Weden, a wild forest race in Malabar and the S. of India, engaged in hunting. Those of the Malabar forests are predial slaves, who cut timber and do not cultivate. The Beder of Zorapore in the Doab of the Kistnah and Bheemah, are settled but predatory. See Veddah.

VEDAN. See Vettuvan.

VEDANGA. Of these there are six, treating on metre, grammar, explanation of words, astronomy, ceremonial. See Aditya; Arian; Hindoo; Veda, p. 55.

VEDANTA. SANS. the end, or last part of the veda. A pantheistic philosophy inferred from scattered texts of the Vedas, the Rig-veda; Yajur-veda; Sama-veda and At'harva veda. See Sri Sampadaya, Kama, Satnami, Inscriptions, Linga, Manu, Saraswati, Tantra, Veda, Yavana.

VEDYA. See Polyandry. Tantra.

VEDANTIN. SANS. he who follows the vedanta.

VEDATHULI MARAM. Dichrostachys cinerea.

VEDATIL, also Vedatara, TAM. Acacia cinerea, *Spr. Willde.* Dichrostachys cinerea, *W. & A.*

VEDA VALLI MARAM. TAM. Vachellia farnesiana.

VEDA VYASA, a famous rishi, the reputed compiler of the Vedas. See Vyasa.

VEDDAH. A wild, semi-savage race, residing in the interior of Ceylon. The forest

Veddah dwell in hollow trees or caves, subsist on game, which they kill with rudely formed bows and arrows, wandering from jungle to jungle as the game becomes scarce. They will not hold the slightest intercourse with any natives but those of their own tribe, and their language is said to be unintelligible to all others. The village Veddah dwell in certain districts, hold but slight intercourse with the other inhabitants of the island, and will not intermarry nor mix with them. They can make themselves understood to the Singhalese. Their sole clothing is a strip of cloth which hangs down in front, and is fastened by a coir cord which passes round their loins. Their hair, beards, and whiskers are never shorn or cleansed, but hang down in matted masses. The forest Veddah are dexterous hunters, and are especially skilful in snaring the wild elephant. The two tribes do not intermarry, as they mutually distrust each other. The Veddah generally deposit their dead in the jungle to be devoured by wild animals. They seem to worship the planets, evil spirits, and spirits of their deceased ancestors. They have their own headsmen, whom they elect and obey. They use bows and arrows and clubs of iron and wood. They occupy a district about 90 miles long and 45 broad in the south-eastern side of Ceylon, lying between the sea and the base of the Badulla and Oovah hills. They are a remnant of the Yakko, the aboriginal inhabitants of Ceylon, who, 2,000 years ago, after the conquest of the island by Wijayo and his followers, returned into the wilds, as the Kuli in Guzerat, the Bhil in Malwa, the Putua in Cuttack, the Kond in Gondwana, and the Beda in Mysore retired before conquerors. The Bisadæ, or Besadæ, which in mediæval Greek is called Vesadæ, are alluded to in the tract of Palladius, de Moribus Brachmanorum, written about A. D. 400, and the same name is applied by Ptolemy to a similar race inhabiting northern India. A forest tribe of Mysore, known by the name of Veda or Beda, formed part of the army of Tippu Sultan. The Veddah live by hunting and use the bow, in drawing which they employ their hands and their feet. They are omnivorous and eat carrion and vermin, roots, grain, fruit, birds, bats, crows, owls, kites, but refuse the bear, elephant and buffalo. Their language is a dialect of Singhalese, free from Sanscrit or Pali, but the vocabulary is very limited, and they have recourse to gestures and signs. They have no knowledge of God, nor of a future state, and have no temples, idols, altars, prayers or charms, but have some ceremonies analogous to a devil worship. They do not bury, but cover their dead with leaves in the jungle. They are regarded by the Singhalese as of ancient descent. Bailey mentions that the language of the Veddah of Ceylon is very limited. It only contains such phrases as are required to describe the most striking objects of nature, and those which enter into the daily life of the people themselves. So rude and primitive is their dialect that the most ordinary objects and actions of life are described by quaint periphrases.

Mr. Forbes describes the Veddah as thinly scattered over an extensive unhealthy tract of country lying between the maritime province of Batticaloa on the eastern coast and the Kandian hills. They are, he says, the descendants of Yakka, the aboriginal inhabitants who were in possession of the eastern part of Ceylon when Vijaya and his followers landed B. C. 543; and, having then escaped from the fury of these invaders into the depths of the forest of Bintenne and Veddaratta, have there preserved the purity of their race, and the superstitions of their ancestors. All Veddah are considered to be of the Goyawanza, the highest caste now existing in Ceylon. The village Veddah have permanent places of residence, cultivate small portions of land, and communicate, although they do not mix, with the other natives of the island. The forest Veddah subsist by hunting, or on such fruits as the earth yields spontaneously; and they obtain arrow-blades, the only article of manufacture which they covet, through the intervention of their own headmen and their brethren of the villages. The Veddah to preserve flesh, cut a hollow tree, and put honey in it, and then fill it with flesh, and stop it up with clay, which lies for a reserve to eat in time of want. The Veddah in Bintenne, whose principal stores consist of honey, live in dread of the bears, because, attracted by the perfume, they will not hesitate to attack their rude dwellings when allured by this irresistible temptation.

The Veddah dry the flesh of deer and other animals, on stages, and then store it in hollow trees. They cook their meat with fire, and have a preference for the iguana, lizard, and roasted monkeys above all other dainties. Lassen supposes them to be descendants of the Lamba kanabo alluded to in the Mahawanso. In the dry weather the Veddah watch at some solitary hole which still contains a little water, to which the deer and every species of game resort. Here his broad-headed arrow finds a supply. He dries the meat in long strips in the sun, and cleaning out some hollow tree, he packs away his savoury mass of sun-cooked flesh, and fills up the reservoir with wild honey; he then stops up the aperture with clay. Nevertheless, they are very bad shots with the bow and arrow, and they never can improve while they restrict their practice to such short ranges. Their bows are six feet long, made of a light supple wood, and the strings are made of the fibrous bark of a tree, greased and twisted. The Veddah in person is extremely ugly; short but sinewy, his long uncombed locks fall to his waist, looking more like a horse's tail than human hair. He despises money, but is thankful for a knife, a hatchet, or a gaudy-coloured cloth, or brasspot for cooking. The women are horribly ugly, and are almost entirely naked. They have no matrimonial regulations, and the children are squalid and miserable. They barter deer-horns and bees-wax with the travelling moormen pedlars in exchange for their trifling requirements.

Doolana is upon the very verge of the most northern point of the Veddah country, the whole of which wild district is the finest part of Ceylon for sport. Up to the early part of the nineteenth century few Europeans had hunted in these secluded wilds. The wandering Veddah, with his bow and arrows, was occasionally seen roaming through this wilderness in search of deer, but the report of a native's gun was never heard. The dimensions of the Veddah country are about eighty miles from north to south, by forty in width. A fine mountain, known as the "Gunner's coin," is an unmistakeable landmark upon the northern boundary. The Veddah huts, among the trees, are temporary watch-houses, from which they guard a little plot of korrakan, Eleusine corocana, from the attacks of elephants and other wild beasts. They live nowhere; they wander over the face of their beautiful country, and migrate to different parts at different seasons, with the game which they are always pursuing. The Vedar or Beder race are spread through several of the western parts of the peninsula.—*Lassen, vol.* ii. *pp.* 100-102. *Baker Rifle, pp.* 120, 121. *Forbes' Eleven Years in Ceylon, vol.* ii. *p.* 75-76-77. *Tennent's Sketches of the Natural History of Ceylon, p.* 24. *Lubbock Origin of Civilization, p.* 292.

VEDDITALE. Tam. Dichrostachys cinerea.

VEDIAVAN, "the Man of Secrets of Knowledge," is the term used by way of reproach to the Jain sect, having the import of magician. Their opponents believe them to be possessed of supernatural skill, and it is be recorded of the celebrated Umara, author of the Cosa or dictionary called after him, that he miraculously "made the full moon appear on Amavus," the ides of the month, when the planet is invisible.

VEDILUNRUASA. Sing. Nitric acid.

VEDURU. Tel. Bamboo, species of Bambusa, B. arundinacea, *Willd.*

VEDURU BIYAM. Tel. Seed of Bambusa arundinacea, *Willd.*

VEDURU GADDA. Tel. Eulophia virens, *R. Br.*

VEDURU GURUTU. Tel. Sprouts of Bambusa arundinacea, used as food.

VEDURU UPPU. Tel. Tabashir.

VEDYADHARAS. See Inscriptions.

VEELAGA CHETTU. Tel. Feronia elephantum, properly Velaga chettu.

VEELVIE. Cratæva Roxburghii.

VEERANROOSTY. The jungum religious mendicants and those of the Veeranroosty caste blow the chank shells as horns.

VEETE. Singh. The smallest long-measure, of Ceylon, equal to a grain of rice.—*Simmond's Dict.*

VEGA. See Shiraz.

VEGETABLE. HAIR. See African hair.

VEGETABLE IVORY, occasionally seen in India as the knobs of walking sticks, is imported into Europe and North America from the river Magdalina, and in some years no less than 150 tons of it were imported into England, where the nuts may be purchased for a few pence each; in August 1854, 1000 were sold for 7 shillings and 6 pence. The ivory plant is confined to the continent of South America, where it grows between the 9th degree of north and the 8th degree of south latitude, and the 70th and 79° of west longitude, and is found in narrow valleys and damp localities from the coast to 3000 feet above the sea. From the kernels or albumen of the fruit, turners fashion the knobs of walking sticks, the reels of spindles, and little toys, which are whiter than animal ivory and equally hard when dry, but soften when placed in water. The plant is supposed to belong to Endlicher's class Spadiciflora and Lindley's alliance Arales, but Martius regards it as the type of a new natural order and named it Phytelephanteæ, and is called the Ivory palm.—*Seeman.*

VEGETABLE KINGDOM. This term is applied collectively to the various forms of plants, as the terms Animal and Mineral Kingdoms are applied to animals and minerals.

Professor Schow, in his 'Notes for a Course of Lectures on the Distribution of Plants,' gives the following:—

(*a.*) Region of Saxifrages and Mosses, or the Alpine Artic Flora: temperature 1·75 to 41° Fahr. This corresponds with the hyperborean region of De Candolle and other writers, and comprehends all countries within the polar circle, namely, Lapland, the north of Russia and Siberia, Kamstchatka, Labrador, Greenland, and Iceland, and also part of the Scottish and Scandinavian mountains, as well as the mountains of the southern and central parts of

Europe with sufficient elevation to possess an alpine vegetation, and the higher elevations of the Himalayas. This region is characterised by the abundance of mosses and lichens, and of the families Saxifragaceæ, Gentianaceæ, Alsinaceæ, Saliceæ, and Cyperaceæ. There is an entire absence of tropical families, and only a few plants of the temperate zone. The beech and fir occur in forests, or there is a destitution of trees. Annuals are also scarce, and the blossoms of the flower are large in proportion to the root of the plant, and of a pure colour.

(*b.*) Region of the Umbelliferæ and Cruciferæ: temperature 27·5° to 56·75°. This comprehends the whole of Europe, except those districts which belong to the preceding region, from the Pyrenees, the mountains of the south of France, of Switzerland, and the north of Greece, to the greater part of Siberia, and the country about Mount Caucasus. This region is particularly distinguished from that of the same parallel in north America by the presence of cruciferous and umbelliferous plants. It is not easily distinguished from the next region, but the fungi abound more, and it approaches the last region in the abundance of Cyperaceæ. Nearly all its trees are deciduous, and its meadows are exceedingly flourishing. There is a division of the Compositæ; the plants belonging to the cichoraceous division of that order being found in the northern districts, whilst those belonging to the cynarocephalous are found in the south of it. The predominating trees are the Scotch fir, the alder, the beech, the birch, the poplar, the elm, and lime. The shrubs are the heaths, the sloe, &c. The principal cultivated plants are the wheat, barley, oats, maize, potatoes, &c.; apple, pear, gooseberry, currant, vine, strawberry, cucumber, melon, the cabbage, turnip, peas, beans, and other forms of Leguminosæ; carrots, hops, hemp, flax, &c.

(*c.*) The Region of Labiatæ and Caryophyllaceæ, or the Mediterranean kingdom: temperature 54·5° to 72·5°. This includes the region of the Mediterranean Sea, limited on the north by the Pyrenees, the Alps, the Balkan, the Caucasus; on the south by the Atlas and the deserts of North Africa; on the east by Taurus. It contains more or less of the orders belonging to the last region; but Labiatæ, Caryophyllaceæ, Boraginaceæ, Cistaceæ and Liliaceæ abound. A few tropical plants now and then appear amongst them, belonging to the orders Palmaceæ, Terebintaceæ, and Lauraceæ, Solanaceæ and Leguminosæ are more abundant than in the last, evergreens increase, and the vegetation never entirely ceases; but verdant meadows are more rare than in the last. Madeira, Azores, and the Canary Islands belong to this region, and their flora approaches to that of tropical Africa. The cultivated plants are similar to the last, to which are added the olive, orange, lemon, mulberry, fig, rice, &c.

(*d.*) The Region of Asteraceæ and Solidaginaceæ, or northern North-American kingdom: temperature 9·5° to 59°. It embraces North America from the southern limits of the first kingdom, 36° N. latitude. There are a greater number of Coniferæ than in the second kingdom, and there are but few Umbelliferæ, Cruciferæ, Cichoraceæ, and Cynarocephalaceæ. There is but little cultivation: where there is any, it resembles that of the second kingdom. Whortleberries, oaks, firs, michaelmas daisies, and golden rods are its great characteristics.

(*e.*) The Region of Magnoliaceæ, or Southern North-American kingdom, between 36° and 30° N. lat.: temperature 59° to 72·5°. There is here an approximation to tropical vegetation, as seen in the frequent appearance of the genera Canna, Chamœrops, Yucca, Zamia, Laurus, Bignonia, Passiflora, Cassia, Sapindus, &c. There are comparatively few plants that are characteristic of the two preceding kingdoms. The Magnolias predominate, and are accompanied with other genera bearing broad shining leaves and large flowers. The cultivated plants are those of the third region, with the exception of the olive: rice is more abundant, and, in the southern districts, the sugar-cane is grown.

(*f.*) The Region of Camellias, and Celastraceæ, or Chino-Japanese kingdom. It embraces Japan and Northern China from 30° to 40° N. lat.: temperature 54·5° to 68.° Too little is known of this region to enable it to be stated positively what are its characteristics. Its vegetation is more tropical than European. With zamas, ginger, bananas, and custard-apples, are found buckthorns and honeysuckles, thus giving this region a mixed character. Its cultivated plants, in addition to those of the previous regions, are the Cycas for sago, the tea-plant, the caladium, &c.

(*g.*) The Region of Zingiberaceæ, or Indian kingdom: temperature 65·75° to 81·5°. This includes the Indian peninsulas east and west of the Ganges, together with the islands between India and Australia. Tropical orders are numerous in this region, as Palmaceæ, Araceæ, Euphorbiaceæ, Bignoniaceæ, Byttneriaceæ, &c. Very few plants belonging to Cyperaceæ, Coniferæ, Labiatæ, Rosaceæ, Ranunculaceæ, or Crucifera are seen. The trees never lose their leaves, and produce large magnificent flowers, and are covered frequently with climbing and parasitical plants. Ginger, zedoary, cardamon, arrowroot, catechu, cassia, cinnamon, caoutchouc, tamarinds, sago, rice, cocoa-nut, coffee, cubebs, cloves, pepper, oranges, and gamboge, are the cultivated and natural productions of this prolific region.

(*h.*) The Regions of the Himalaya: temperature 36.5° to 65·75°. It includes the highlands of India, or the mountain terraces lying on the south of the Himalayan range, Kumaon, Nepal, Bootan, having an elevation of from 4000 to 10,000 feet. The tropical forms of the last kingdom decrease manifestly here, such as Scitaniaceæ, Palmaceæ, Cycadaceæ, &c. European forms are not unfrequent, as Cyperaceæ, Amentaceæ, Primulaceæ, Rosaceæ, Cruciferæ, &c. The Ferns and Orchidaceæ are abundant. The cultivated plants are the corn and fruit of Europe, varying with more tropical productions according to elevation.

(*i.*) The Region of Polynesia includes the islands between Hindustan and Australia, and has a temperature from 65·75° to 83·75°. This region is similar to the Indian kingdom. and is sometimes included in it. The cultivated plants in addition to those of the Indian kingdom, are the bread-fruit-tree, the nutmeg, the camphor-tree, and the cotton-tree.

(*j.*) The Region of Java has a vegetation probably similar to the Himalayan region.

(*k.*) The Oceania Region, or South Sea Island kingdom, includes all the islands of the South Sea within the tropics, and has a temperature of 72·5° to 81·5°. The flora of these islands is poor, and approximates more closely to that of Asia than to that of Africa, and has some relation to that of Australia. The bread-fruit is the most characteristic production of these islands, but is not confined to them.

(*l.*) The region of Balsomodendra, or the Arabian kingdom, includes the south westerly mountainous part of the Arabian peninsula. The character of its vegetation is generally tropical, assuming the forms of that of India. The cultivated plants are also principally those of India.

(*m.*) The Desert Region includes North Africa south of the Atlas, and the Mediterranean Sea between 15° and 30° N. lat, and the northern parts of Arabia. The mean temperature is 72° to 86°. It has necessarily a very poor flora, having but few even characteristic genera. It is only cultivated in the oases, where the Phœnix dactylifera, the Sorghum vulgare, with wheat and barley, and some of the fruits of Europe and India, constitute the prominent plants.

(*n.*) The Region of tropical Africa includes Africa from 15° N. lat. to the tropic of Capricorn. Temperature 72°5′ to 86°. This flora is neither rich nor rare; it abounds in Leguminosæ, Rubiaceæ, and Cyperaceæ. The Adansonia is the characteristic genus.

(*o.*) The Region of Cacti and Piperaceæ includes Mexico and South America to the Amazon River, and to a height of 5000 feet above the level of the sea. Temperature 68° to 83°74. The orders which characterise this region are Bromeliaceæ, Piperaceæ, Passifloraceæ and Cactaceæ. The orders which are mostly tropical are here less numerous, whilst extra tropical orders are more abundant. The most abundant genera are Phytelephas, Kunthia, Thouinia, Theobroma, Guazuma, &c. The cultivated plants of this district are the maize, Sorghum vulgare, Dioscorea, Convolvulus; also the plantain, cocoa-nut, pine-apple, tamarind, cacao, vanilla, coffee, sugar, tobacco, cotton, &c.

(*p.*) The Region of the Mexican Highlands includes the mountains of Mexico above 5000 feet elevation. Temperature from 65°·25 to 79° 25 In this district the more tropical forms of vegetation, as the tree-ferns, the palms; passion-flowers, euphorbiums, and pepper, decrease or altogether disappear. The extra tropical forms are more numerous, as the willow, oak, fir, cypress, sago, horehound, whortle berry, heath, and various forms of Umbelliferæ, Rosaceæ, Caryophyllaceæ, and Ranunculaceæ. The cultivated plants are maize, the European cerealia and fruits. In the highest mountain-ranges the vegetation has an alpine aspect.

(*q.*) The Region of Cinchonaceæ. This embraces the Andes from 5000 to 9000 feet in elevation, and between 20° S. lat., and 5° N. lat., having a temperature from 59° to 68°. The extra tropical forms become very frequent in this region, and only a few tropical forms remain. Some of the most common genera are the Cinchona, Gay-Lussacia, Loasa, Lilæa, Cervantesia, &c. The cultivated plants are very seldom tropical. Maize and coffee are sometimes grown, with European cerealia and fruits, potatoes, and Chenopodium quinoa.

(*r.*) The Region of Escallonias and Calceolarias includes the Andes at more than 9000 feet above the level of the sea, between 20° S. lat. and 5° N. lat. Temperature 34° 25° to 59°. Tropical plants almost entirely disappear in this region, only now and then a straggler appearing; whilst the forms which distinguish the colder and polar regions become frequent, such as the lichens, mosses, sorrels, plantagos, gentians, currant, brambles, &c. The most prevalent orders are the grasses, heaths, and Synantheraceæ. There are no large trees, and a great many shrubs.

(*s.*) The West Indian Region, including the West India Islands, with a temperature of 59°

to 79·25°. The vegetation of these islands bears the same relation to the continent which that of the Polynesian islands does to China. It is chiefly distinguished by the greater quantity of Ferns and Orchidaceæ. The cultivated plants are the same as those of Mexico.

(*t.*) The Region of palms and Melastomaceæ, or Brazilian kingdom, including Brazil, or South America, on the east of the Andes, between the equator and the tropic of Capricorn; temperature 56° to 83·7°. This region is remarkable for the number of its genera and species, the size of individual trees, the dense forests, and the numerous climbing and parasitical plants. Vegetation seems here to attain its greatest activity and energy. The orders which abound most are Palmaceæ, Homaderaceæ, Gesriaceæ, Nielastomaceæ, Sapindaceæ, and, altogether confined to this region, Vochyaceæ. The cultivation is very similar to that of Mexico.

(*u.*) The Region of Woody Compositæ. In South America, on the east of the Andes, from the tropic of Capricorn to 40° S. lat.: temperature 59° to 74.75°. There are but few tropical plants in this region, and extra tropical plants, especially European forms, are abundant, more than half being common to this region and Europe. The Woody Compositæ abound. This region consists chiefly of plains (pampas), which for hundreds of miles present almost the same vegetation, consisting chiefly of thistles and grasses; wheat, the vine, and the peach are cultivated.

(*v.*) The Antarctic Region includes the south-westerly part of Patagonia, Tierra del Fuego, between 50° and 55° S. lat.: temperature 41° to 47·5°. In this region there are no tropical plants, and its vegetation resembles in a great measure the North-European flora. In some of the genera there is an approach to the South African and Australian flora.

(*w.*) The Region of Stapelias and Mesembryanthemums. This embraces South Africa from the tropic to 35° S. lat.: temperature 54·5° to 72·5°. The vegetation of this region is not luxuriant, but it is very rich in forms There are no dense forests nor climbers, but many succulent plants. The orders Restiaceæ, Iridaceæ, Proteaceæ, Ericaceæ, Ficoidaceæ, Bruniaceæ, Diosmaceæ, Geraniaceæ, Oxalidaceæ, and Polygalaceæ, embrace its characteristic vegetation. On the sandy coasts the genera Stapelia, Mesembryanthemum, and Diosma, are found, and on the mountains Protea, Erica, and Brassula. The cultivated plants are those of Europe, with the Musa Paradisiaca, Convolvulus batatas, the tamarind, and Sorghum caffrorum.

(*x.*) The Region of Eucalypti and Epacridaceæ. It includes extra-tropical Australia and Van Diemen's Land: temperature 42·25° to 72°·5. Vegetation is not abundant in this region, but this deficiency is compensated by the variety and peculiarity of its forms. The most abundant of the trees are the Eucalypti, which form three-fourths of all the woods. Next come the genera of Proteaceæ, Banksia, Hakea, Dryandra, Gevillæa, &c.: and next to these follow Epacridaceæ, Diosmaceæ, and Casuaraceæ. Its cultivated plants are all European.

(*y.*) The Region of New Zealand includes the two New Zealand isles: one half of the species are European. The vegetation is not characterised by the prevalence of large groups. Some of the genera approximate the South African flora, and some the Australian.

(*z.*) Indian flora. Drs. Hooker and Thomson relate that all the main elements of the Indian flora exist in its surrounding countries, and that the families of plants peculiar to it are of very limited number. The Aurantiaceæ, Dipteraceæ, Balsamineæ, Ebenaceæ, Jasmineæ and Cyrtandraceæ, are the only orders which are largely developed in India and sparingly elsewhere, and of these few contain one hundred Indian species. India contains representatives of every natural family on the globe, and it contains a more general and complete illustration of the genera of other parts of the world than any other country whatsoever. The Compositæ are, however, especially deficient, as also are the Gramineæ and Cyperaceæ, in some regions, Leguminosæ, Labiatæ, and Ferns in others, whilst Euphorbiaceæ and Scrophulariaceæ are universally present, and Orchideæ appear to form a larger proportion of the flora of India than of any equally extensive country. The total number of Indian species of plants are estimated by Drs. Hooker and Thomson at 12,000 to 15,000, but they are not generally diffused, and it is believed that no part of the whole area in India produces 2,000 species of flowering plants in a radius of ten miles. In the more humid jungles, many species may be gathered in an extensive area: in the dry arid tracts of Central India it would be difficult to collect 150 species in several miles. At 4,000 to 5,000 feet elevation in the Khasia, fifty species of Gramineæ and twenty to thirty species of Orchideæ have been collected in an eight miles walk. The mountains of India, when above 4,000 or 5,000 feet, present a temperate vegetation, which becomes wholly temperate at greater elevations, and passes into an alpine flora over a large extent of still loftier mountain country. In the humid parts of tropical India, as in the impenetrable green jungles of the equable and rainy Malayan peninsula, of eastern Bengal, the west coast of the Madras presidency, and of Ceylon, the flora contrast strongly with the drier parts of the intertropical zone, and still more so with the loosely timbered districts of Central India and of the base of the western Himalaya. The drier tropical forests of India are much modified in luxuriance and extension by the winter cold in those extratropical latitudes over which they spread; hence many tropical genera and families, as most palms, Cycas, Dipterocarpeæ, except Vatica, Aurantiaceæ, Connaraceæ, Meliaceæ, Myrtaceæ, Rubiaceæ, Ebenaceæ, and many more, which are sensitive to cold, are comparatively local when found beyond the tropics; others which are indifferent to the cold of winter, as are many Leguminosæ, (viz, Bauhinia, Acacia, Erythrina, Butea, Dalbergia, and Milletia,) Bombax, Vatica, Nauclea, Combretaceæ, Verbenaceæ, Lagerstræmia, Grislea, Jasmineæ, and Bignonia Indica, are indifferent to the cold of winter, provided they experience a great summer heat; and they advance far beyond the tropics and lend a more or less tropical aspect to the flora even of the base of the north-western Himalaya in lat. 35° north. On the other hand, the perennially humid forests are uniformly characterized by the prevalence of ferns, and at elevations below 5,000 to 7,000 feet, by the immense number of epiphytal Orchideæ, Orontiaceæ and Scitamineæ. They contain a far greater amount of species than the drier forests, and are further characterized by Zingiberaceæ, Xyrideæ, palms, Pandaneæ, Dracæna, Piper, Chloranthus, Urticaceæ (especially Artocarpeæ, and Fici), Araliaceæ, Apocyneæ, shrubby Rubiaceæ, Aurantaceæ, Garciniaceæ, Anonaceæ, nutmegs and Dipterocarpeæ Besides species of the Gramineæ and Cyperaceæ, a vast number of animal plants vegetate only during the hot rainy season, and, neither exposed to drought or cold, the small Leguminosæ and Scrophularinæ occur amongst Sida, Corchorus, Nama, Blumea, and other Compositæ, some Labiatæ (as Leucas, Anisomeles, &c.) Amaranthaceæ, Acanthaceæ, Convolvulaceæ, Ludwigia, Jussieua, &c. And these tropical annuals and perennial rooted plants with annual stems, are not confined to the plains, but ascend the loftier mountain valleys as far as the well marked rainy season extends, and only disappear where the accession of heat and humidity is not sufficient in amount, or regular enough in period, to stimulate their vegetative organs. Among the most remarkable of these extratropical examples of tropical genera are species of Bignonia, Osbeckia, Argostemma, Plectranthus, various Cyrtandraceæ, Scitaeæ, Araceæ, Commelynaceæ, and a few epiphytal Orchideæ. And during the cold months only in the extratropical regions of India, numerous genera and species of annual plants of the north temperate zone flower when the tropical plants are torpid. Besides the wheat, barley, and more rarely oats, with various kinds of pulse, which form the winter crops of the Gangetic plain of central India, of Berar, of Central Dekkan, of Mysore and Coimbatore, there are of wild plants Ranunculus sceleratus, and muricatus, Capsella bursa-pastoris, Selene conica, Alsine media, Arenaria serphillifolia, Euphorbia heleoscopia, Medicago lupulina andenticulata, Lathyrus aphaca, Gnaphalea, Xanthium, Veronica agrestis and anagallis, Heliotropium Europeum, various Polygona, Juncus bufonius, Butomus umbellatus, Alisma plantago, and very many Cyperaceæ, Gramineæ, and such aquatics as Myriophyllum, Potamogeton natans and crispus, Vallisneria, Zannichellia, Ranunculus aquatitis, Lemna and many others. In the regions at the base of the mountains in the perennially humid provinces of India, from the atmosphere being more loaded with moisture, the climate is more equable than that of the adjacent plains, and a warm temperate flora, unknown to the plains, commences at elevations of 2,000 to 3,000 feet, and prevails over the purely tropical vegetation which appears amongst it in scattered trees and shrubs. Amongst other orders we may mention Magnoliaceæ, Ternstrœmiaceæ, subtropical Rosaceæ (as Prunus, Photinia, &c.) Kadsura, Sphærostema, Rhododendron, Vaccinium, Ilex, Styrax, Symplocos, Olea, Sapotaceæ, Lauraceæ Podocarpus, Pinus longifolia, with many mountain forms of truly tropical families, as palms, Pandanus, Musa, Clusiaceæ, Vines, Vernonia, and hosts of others.

In the Himalaya, the truly temperate vegetation supersedes the subtropical above 4,000-6,000 feet; and the elevation at which this change takes place corresponds roughly with that at which the winter is marked by an annual fall of snow. This phenomenon varies extremely with the latitude, longitude, humidity and many local circumstances. In Ceylon and the Madras peninsula, whose mountains attain 9,000 feet, and where considerable tracts are elevated above 6-8000, feet, snow has never been known to fall. On the Khassya mountain which attains 7,000 feet, and where a great extent of surface is above 5,000 feet, snow seems to be unknown. In Sikkim, snow annually falls at about 6,000 feet elevation; in Nepal, at 5000 feet, in Kumaon and Gurhwal at 4,000, and in the extreme West Himalaya lower still. In the mountains of Ceylon, on the Neilgherries, and on the Khassya hills, the temperate forms of plants are more numerous than upon the Himalaya. Violent winds sweep over the broad grassy undulating tops of the Khassya hills, and hundreds of species common to the Sikkim Himalaya and to the Khassya ascend higher in the warm forest-clad and sheltered Himalayan valleys at 5-7000 feet in Sikkim than they do in the Khassya hills. In the Himalaya, the genera Rhododendron, Monotropa, Pedicularis, Corydalis, Nepeta, Carex, Spiræa, Primula, Cerasus, Lonicera, Viburnum and Saussurea, attain their maximum of development over all other parts of the world. Ephedra ranges from the plains of the Punjab up to 16,000 feet in the N. W. Himalaya : the genus Marlea ascends from 3,000 to 8,000 feet in Sikkim and in the western Punjab, at scarce 4,000 feet, accompanies Celtis and a species of ash : subtropical Myrsine extend into Afghanistan. Juniperus excelsa, found as low as 5,000 feet in Afghanistan, ascends to 15,000 feet in Tibet. Populus Euphratica, a Cynanchum, Chloris barbata, Cyperus aristatus, are tropical and subtropical plants which ascend to 11,000 feet in Ladak, and Peganum harmala attains to 9,000 feet. The alpine or arctic flora, on the Alpine region of the Himalaya, commences above the limit of trees throughout a great part of the Himalaya, and hardly reaches its extreme limit at 18,500 feet (3½ miles) of elevation. It has a comparative paucity of cryptogamic plants, is poor in the luxuriant mosses of tall growth and succulent habit, and though fully representing the flora of the polar regions, it partakes in its characteristic genera of the temperate flora, and contains so many types foreign to the flora of the polar regions (as Gentiana, Ephedra, Velerianeæ, Corydalis) and some which are even rare in Siberia, that it must rather be considered as a continuation of the alpine flora of Europe than a representation of that of the Arctic zone.

The bulk of the flora of the perennially humid regions of India, as of the whole Malayan peninsula, the upper Assam valley, the Khassya mountains, the forests at the base of the Himalaya from the Brahmaputra to Nepal, of the Malabar coast and of Ceylon, are of one type which includes a very large proportion of the Indian genera.

The floras of the frontier provinces of India are identical with those of the countries which surround them, and there is even a decided affinity between the floras of areas separated by oceans, deserts, or mountain chains, which present many natural characters in common, for which neither migration nor climate will account.

Of the flora of Australia, Pittosporum and Scævola are found all over India and Africa, and of two species of Stylidium, one extends to Midnapore in the Gangetic delta, and one in the Malayan peninsula, along with several genera of Myrtaceæ (Leptospermum, Bœkia, Metrosideros,) and the genus Tristania which advances to Moulmein in L. 17° N. Also the casuarina grows wild up to Ramree, Helicia in the Malay peninsula, and the Lagenophora of N. Zealand and Australia, has a representative in the Khassya and Ceylon. Many species of tropical plants of the Neilgherry and Khassya hills, of Ceylon, and of the Himalaya, are identical with Javanese mountain plants. Gaultheria nummularia is found in the N. W. Himalaya, through the whole range into the Khassya, and also on the Javanese mountains 3,000 miles distant. The Sedgwickia cerasifolia of Griffith (Liquidambar altingia of Blume), also the curious Cardiopteris lobata, several oaks and chesnuts, Antidesmæ, a willow, and Myrica, are common to the Khassya and Java, and Marlea is spread into China, throughout the Himalaya, and to the mountains south of Kashmir.

Amongst the Indian flora are many temperate genera and species which are common to N. America west of the Rocky Mountains, besides many tropical species that are also Malayan and west Polynesian.

The Chinese type is abundant in the temperate regions of the Himalaya, is fully developed in the Khassya, Sikkim and Butan, and extends westward to Gurhwal and Kumaon. Chinese and Japanese species of Aucuba, Helvingia, Stachyurus, Enkianthus, Abelia, Skimmia, Bucklandia, Adamia, Benthamia, Corylopsis, and of those common to India and China are Microptelea parvifolia, a species of elm, Hamamelis Chinensis, Nymphœa pygmæa and Vaccinium bracteatum, all of the Khassya ; Quercus serrata of China, Nepal, Sikkim, and the Khassya, while species of Illicium occur in the Khassya, Theà in Assam, and Magnolia in Sikkim and Khassya, with species of Camellia, Deutzia, Hydrangea, Viburnum, several Corneæ and Houthuyniæ. Schizandreæ are peculiarly characteristic of the Chinese flora, but also extend into Java. Lardizabaleæ belong to the Himalaya, Japan and China. The fern Bowringia is found in Hong-Kong and in the Khassya, and the genera Daphne, Bucklandia, Enkianthus, Henslowia, Scepa, Antidesma, Benthamia, Goughia, Myrica and others, are both Chinese and Indian. Euryale ferox is abundant in China, in the delta of the Ganges and in Kashmir, and Nepenthes phyllamphora is a native of the Khassya, of Macao and of the Louisiade archipelago.

The Siberian type of plants is very fully represented in the upper and alpine regions of the Himalaya, and is most confined to the drier parts of the chain, but may be observed even in the most humid regions of the Himalaya, and occasionally on the mountains of tropical India. It approaches in many respects to the south European vegetation, but is characterized by the predominance of Fumariaceæ, Potentillæ, Leguminosæ, (especially Hedysarum and Astragaleæ,) of Umbelliferæ, Lonicera, Artemisia, Pedicularis and Boragineæ, and by the rarity or total absence of the European Cistaceæ, Rosa, Rubus, Trifolium, Erica, ferns, and other cryptogams. Artemisia and Artragalus of the Siberian type are abundant throughout Tibet and the interior Himalaya, are represented by a few species in the plains of the Panjab and on the Khassya mountains. Spiræa Khamstchatica, chamædrifolia and sorbifolia, and Paris polyphylla are alike Siberian and Himalayan forms, while Corydalis sibirica and Nymphæa pumila are identical in Siberia and on the Khassya.

The extent to which the plants of Europe abound in India has only lately been known, but 222 British species have been ascertained to extend into India, and a multitude of mountain plants, many of them the most conspicuous in Europe, range from the coasts of the Levant and the Black Sea to the Himalaya. This is the more remarkable as the Himalaya range is, in idea, rather than really connected with the mountains south of the Caspian, or with the Caucasian alps, or those of Asia Minor, for the mountain mass of Asia sinks to the westward of Afghanistan, rising again only in isolated peaks. The Corylus colurna (C. lacera, *Wall.*) ranges from the Levant and the Black Sea to the Himalaya. Quercus ilex, Ulmus campestris, Celtis australis and orientalis, extend from Spain to the N. W. Himalaya, but the walnut, ivy, juniper, yew, extend from Europe through the Himalaya, across China, through Mexico, and throughout N. America. The yew, the juniper, Aquilegia vulgaris, Caltha palustris, &c. are common to most parts of Europe, Northern Asia, the Himalaya, and N. America. The Mediterranean flora, Celtis, Quercus ilex, Olea europea, Myrtus communis, &c. of the Mediterranean, are also Himalayan plants. The European plants, however, rapidly disappear to the east of Kumaon, but there is a blending of the European flora on the east of the Himalayan chain, as to the eastwards there is a mixture of Chinese and Malayan forms with that of the Himalaya.

Many North African or Arabian forms, such as Peganum, Harmala, Fagonia cretica, Balanites Ægyptiaca, Acacia arabica, Alhaji, Grangea, Calotropis, Salvadora persica, extend through the drier parts of India, and others, Cleome, Balsamodendron, Astragalus hamatus, Cucumis colocynthis, Berthelotia, Anticharis arabica, &c., have a less extensive range, and there is a striking resemblance between the vegetation of tropical Africa and tropical Asia.

If a manufacturer have specimens of all the substances which could be employed in his particular manufacture, with information whence each could be procured, its cost, the quantities in which he might obtain it, and its physical and chemical properties, he would soon be able to select for himself the one best suited for his purposes. This, however, has never happened in relation to any one art; manufacturers have to make the best of the materials which chance or accident brings before them. There are many excellent and abundant productions of nature with which manufacturers and men of science are wholly unacquainted. The old English poet, Herbert, who flourished in the fifteenth century, in a short poem on "Providence," has graphically described, in his unique vein, the sentiment which forces itself upon us in view of the numerous discoveries of the age in which we live :—

> "All countries have enough to serve their need ;
> ——————The Indian nut alone
> Is clothing, meat and trencher, drink and can,
> Boat, cable, sail, and needle, all in one."

The addition of even a single flower, or an ornamental shrub, to those which we already possess, is not matter below the care of industry and science. The more we extend our researches in the productions of nature, the more are our minds elevated by contemplating the variety as well as the exceeding beauty and excellence of the works of the Creator.—*Simmonds' Vegetable Products. VEGETABLE MARROW.

Squash Gourd ENG. | Suppara Roomro, HIND.

This very delicate vegetable of the gourd species, is the Cucurbita ovifera, *Linn.* The crooked-necked variety, when about six inches long, is well flavoured, but soon gets hard and stringy. The pear-shaped is the best of any, but must be dressed when young. Propagation only by seed, and the plants should never be removed, but remain where sown, only thinning the weakly ones. The soil should be a rich loam, the same as for cucumbers. Train the plant on sticks. It is often necessary to fertilize the female blossoms, by approaching the anthers of the male flower when charged with pollen.—*Riddell.*

A great variety of vegetables are indigenous or cultivated in the Tenasserim Provinces; but the best are scarce, and rarely for sale in the bazars, but nearly every plant produces a vegetable for the natives of the Burmese provinces. The Burman books say there are ten kinds of vegetables or pot herbs, corresponding to the parts of a plant that furnish them. Vegetables enter largely into the composition of the food of all nations, as will be shown by the following diet tables given by Dr. Christison for the Army Commissariat which show a percentage of nutriment as under:

ARTICLES. Rations.	Carboniferous.	Nitrogenous.	TOTAL.
Biscuit or Wheat-flour ...	71·25	16·25	87·5
Bread	51·5	10·5	62·

VEGETABLE TALLOW is obtained from the China tallow tree, or Stillingia sebifera. It has flowered and seeded at Amritsur and Lahore.—*Powell Hand-book v. I. p.* 423.

VEGETABLE WAX is obtainable at Shanghae in China, in St. Domingo, in the northern parts of which the plant is indigenous, and in Japan. From its high melting point and other physical characteristics, it has of late attracted a good deal of attention; it is admirably suited as a material for the manufacture of candles.—*Simmond's Commercial Products p.* 540.

VEGI or Vengi-desam, an ancient state ruled by buddhist princes,who reigned at Dara Nagara near Amravata and at Vengipuram. The exact site is not known.

VEGI, also Vegisa chettu. TEL. Pterocarpus marsupium.

VEGUTTVAM, lit. plurality, a name given to Vishnu's ninth incarnation by Ziegenbalg's correspondent.

VEHAR LAKE supplies Bombay with water. It is situated at the foot of the Salsette hills.

VEHOA. See Khyber.

VEHRI. HIND. Cocculus leæba.

VEHRKANA. See Arians.

VEKKALI TREE WOOD. ANGLO-TAM. A serviceable, variegated, hard, close-grained wood employed by the natives in house-building, and also for making doors, windows, handles of instruments, &c. &c.—*Ains. Mat. Med. p.* 206.

VEKKUDTIGE. TEL. Diospermum halicacabum, *Linn.*

VEKU MATTI. MALEAL. Citrullus colocynthis, *Schrœd.*

VEL. TAM. Acacia Arabica ?

VELA also Bel, is the general term for a climber, sacred to the Indian Bacchus (Baghes, Adiswara, or Mahadeva,) whose priests, following his example, are fond of intoxicating beverages or drugs.—*Tod's Rajasthan v. I. p.* 22.

VELA-ELLE. TAM. Mussœnda frondosa, *Linn.*

VELAGA. TEL. Feronia elephantum, *Corr.*

VELAGA BADANIKA or Badanike. TEL. Loranthus longiflorus, *L.*

VELAGA PANDU. TEL. fruit of Feronia elephantum.

VELAITI. DUK. TEL. from Valait, PERS. a foreign country.

VELAITI AGATI. DUK. HIND. Cassia alata, *Linn.*

VELAITI AMLI. DUK. Garcinia cambogia.

VELAITI BIHI. HIND. Cydonia tomentosa.

VELAITI CHUNNA. Duk. Chalk.

VELAITI KAFUR KI PAT. Duk. Salvia Bengalensis.

VELAITI MUNG. Duk. Ground nut, Arachis hypogæa.

VELANGA. Maleal. Feronia elephantum, *Cor.*

VELANNE. Hind. Mentha incana.

VELA PARTI. Tam. Dœmia extensa, *R. Brown.*

VELAPATHRI MARAM. Tam. Stereospermum chelonoides.

VELARI. Tam. Oil of Celastrus paniculata. Malkangani oil.

VELAS. Port. Sp. Candles.

VELASALU. Tam. The Ceylon white ironwood, which grows to about fourteen inches in diameter, and ten feet high. It is used for huts, poles, &c., where strength and durability are required.—*Edye, Ceylon.*

VELATTE. Tam. Ballangu, Portuguese. A Ceylon tree which grows to about fourteen inches in diameter, and eight or ten feet in height. Its wood is remarkably strong, and is used in vessels. It produces an edible fruit.—*Edye, Ceylon.*

VELATTI. Tam. A wood of Malabar and Canara, which resembles the English pear tree wood, and answers well for carved-work, from the fineness of its grain. The tree grows to about twelve inches in diameter, and fifteen feet high.—*Edye, Forests of Malabar and Canara.*

VELA VENGE MARAM. Tam. Acacia odoratissima, *Roxb. Willd.*

VELEANA. Tam. A Ceylon tree which grows to about twelve inches in diameter, and eighteen feet in height. In appearance it resembles English oak. The native carpenters use its wood in boat and vessel frames, knees, &c.—*Edye, Ceylon.*

VELENGE. A Ceylon wood used for making betel trays.—*Simmond's Dict.*

VELE PANDU. Tam. Allium sativum. Garlic.

VELE UMATE. Tam. Datura alba, *Rumph.*

VELHA AHGUILL. Tam. A wood of Travancore, of a light brown colour, 2 to 4 feet in circumference, used for furniture.—*Col. Frith.*

VELIGARAM, or Kunkuma puvvu. Tel. Rottlera tinctoria, *Roxb.*

VELIGARAM. Tam. Borax.

VELI KUNDRICUM. Tam. resin of Vateria indica, *Linn.*

VELI-PARATAI. Tam. Cynanchum extensum. Dœmia extensa, *R. Brown.*

VELLAH AHGUILL. A Travancore wood of a white colour, specific gravity 0·602, 2 feet in circumference, 50 feet long, used for furniture.—*Col. Frith.*

VELLAI CADAMBAI. Tam. Nauclea cadamba.

VELLAI MARUDU. Tam. Terminalia Berryi.

VELLAI MUNTHARAI MARAM. Tam. Bauhinia acuminata, *Linn* B. albida? *Gibson.*

VELLAI NAGA MARAM. Tam. Conocarpus latifolia, *Roxb., W. & A., W. Ic.*

VELLAI POONDU YENNAI. Tam. Garlic oil.

VELLAI PUNA PINU. Tam., or the white peon pinu tree, can be procured in all parts of the coast of Malabar. It grows to seventy and eighty feet long, and to three feet in diameter; the natives use it for the masts and yards of dowes and other country vessels. It is more like the American white pine, and the upright yellow wood at the Cape of Good Hope (Antinagnatis), than any wood Mr. Edye had seen.—*Edye, M. and C.*

VELLAI SOALUM. Tam. White variety of Sorghum vulgare.

VELLAI TOARATTI MARAM. Tam. Capparis grandis, *Linn., W. & A., W. Ic.*

VELLAI TUMMA. Tam. Acacia leucophlœa, *Willd.*

VELLAI VENGAH, the Tamil name of a Malabar and Canara tree, the wood of which is of a light colour, and very tough and strong. It is used by the natives for the frames of vessels, or where strength is required; it grows to about eighteen inches in diameter and twenty feet long, and the small branches make good crooks for boats—*Edye Forests of Malabar and Canara.*

VELLAK. Tam. a lamp.

VELLA KADALI. Tam. Arachis hypogæa, *Linn., W. & A., R.*

VELLA-KIRE. Tam. Ipomæa reptans.

VELLAK YENAI. Tam. Lamp oil.

VELLA KUNDRICUM. Maleal. resin of Vateria indica, *Linn.*

VELLAL. Tam. Embelia ribes, *Burm.*

VELLALA. Amongst the Tamul races who have adopted brahminism, the Vellala, alike in numbers and in social rank, take the chief place. They are very largely agricultural, and take the honorific appellation of Mudali or first man, which seems to be from the same root as the word Mandal, the village headman of Bengal. The designation, Velala, means charitable, but they claim to be Vaisya, of the Bu-vansa or agricultural section. They believe that they came from the north. They are shorter and darker than brahmins, darker even than the Tiling people, but they have, in general, well formed countenances and graceful forms, though amongst them also occur the decidedly African lip and nose and forehead of which Mr. Logan makes mention.

VELLA-LAVA. TAM. A wood of Travancore of a brown colour, used for light work. —*Colonel Frith.*

VELLALER, a tribe bearing this name are said to wander about in the jungles of the Poodoocottah estate. They are scantily clothed and subsist on the produce of the jungles.

VELLA MUNTHARA MARAM. TAM. Bauhinia acuminata.

VELLA MUREE ? Indigofera tinctoria.

VELLA-NAGA. ——? Conocarpus latifolia.

VELLANATI WANLU. TEL. Reddi, TAM. TEL. Potail. MAHRATTA. Village heads or village authorities. See Bara Balati.

VELLA-MUNTHARI-PU. TAM. Bauhinia albida.

VELLA-NEER-MARADOO. TAM. A Travancore wood of a light yellow colour, used for furniture, sp. gr. 0·573.—*Colonel Frith.*

VELLAREE KAI. TAM. Cucumis usitata.

VELLA TURU. TEL. Acacia cinerea, *Willde.*

VELLAUR, a river which rises at the base of E. Ghauts, Lat. 10° 28′, Long. 78° 21′ E. It runs to the east and disembogues into the Bay of Bengal, near Porto Novo. The river is small at its mouth, and admits only coasting craft. Length eighty miles.

VELLA VENGAH. TAM. A tree of Malabar, the wood of which is of a light colour and very tough and strong, and is used by the natives for the frames of vessels, or where strength is required ; it grows to about eighteen inches in diameter and twenty feet long, and the small branches make good boat crooks.—*Edye. M. & C.*

VELLAY OOMATTAY. TAM. Datura alba.

VELLA YERKAM. TAM. White var. of Calotropis gigantea.

VELLAY NAGA MARAM. TAM. Conocarpus latifolia.

VELLAY-PANDU YENNAI. TAM. Garlic oil.

VELLAY PUTALLI MARAM, also Vella butali, also Kavali. TAM. Sterculia urens, *Roxb.*

VELLAY-SHARUNNAY. Trianthema obcordata.

VELLAY TOARATTI MARAM. TAM. Capparis grandis.

VELLE AERE. TAM. A Ceylon tree, grows to about twelve or eighteen inches in diameter, and twenty feet in height. It has a light wood, and is generally converted into catamarans, being considered useful for that purpose only.—*Edye. Ceylon.*

VELLE ATI NAR. TAM. Fibre of Bauhinia tomentosa.

VELLE-ELOW. MALEAL. A tree that grows to about sixteen feet high and eight inches in diameter. Its wood is used for the frames and knees of country vessels. It produces a white seed which is used medicinally. —*Edye, M. & C.*

VELLEY ELLEY, or Belilla, also Velleemadenthay. TAM. Mussœnda frondosa.

VELLE NAGA MARAM. TAM. Conocarpus latifolia.

VELLE NEALEA. MALEAL. A Ceylon tree which grows to about ten inches in diameter and ten feet in height. The branches are very strong, and are used for the frames of native vessels.—*Edye, Ceylon.*

VELLE NUCHI. TAM. Vitex negundo, *Linn.*

VELLE PASHANAM. TAM. White oxide of arsenic.

VELLERI-KAI. TAM. Cucumis sativus, *Linn.* Velleri-kai yennai, also Velleri-verei yennai. Oil of seed of the cucumber, Cucumis sativus, *Linn.*

VELLI. TAM. Silver.

VELLIELLUS. A Malabar and Canara tree, little used except by the natives for house work, its growth is small, and it is rather scarce.—*Edye, Forests of Malabar and Canara.*

VELLIE PUNA, known in Malabar as the white also Kat-puna. It grows to about eighteen inches in diameter and eighteen feet high, and is used by the native carpenters for the frames of vessels. It grows curved and is not durable. It is not found in any quantity in the forests.—*Edye, M. & C.*

VELLIGURUM, also Vengarum. TAM. Borax.

VELLIGUDDA, properly Vulligadda. TEL. Garlic.

VELLITURU. TEL. Dichrostachys cinerea, *W. & A.*

VELLORE, in L. 12° 55·1′, L. 79° 7·3′, a town in the Karnatic on the right bank of the Palar river, 695 feet above the sea, about 70 miles west of Madras, a military cantonment with a fortress, now dismantled. It was a large military station in the early part of the 19th century, and the native soldiery, incited by the descendants of Tipoo, mutinied on the 31st January 1807, and destroyed nearly all the Europeans. A remnant was saved by Colonel Gillespie, who, commanding at Arcot, 18 miles distant, brought over a body of cavalry. The people designate it Rai-Ellur, or stoney Ellur, to distinguish it from Uppu-Ellu, or saline-Ellur, the Ellore of the maps.

VELLULLI. TEL. Allium sativum, *Linn.*

VELLUM. Tam. White crystalized sugar.

VELLUM. A fine, white, smooth, kind of parchment, made of calf-skin.—*Faulkner.*

VELLUMA SANDHI CHETTU. Tel. Leea hirta, *Banks.*

VELLUTO. It. Velvet.

VELLUTTA-MODELA-MUKU. Mal. Polygonum barbatum.

VELL VIRU. Tam. A Ceylon tree about fourteen inches in diameter and eight feet in height. Its wood is strong and durable and used as supporters in huts.—*Edye, Ceylon.*

VELLY UMATE. Tam. Datura alba, *Rumph.*

VELMA, Ailma, or Yelmi, in the Tiling country, are a dominant agricultural tribe with military proclivities, and claim to be rajputs. They are soldiers and agriculturalists.

VEL MARUDAM. Tam. Pentaptera glabra.

VELOURS. Fr. Velvet.

VELTHOENS ISLAND, the most south-easterly of the Token Bessays group, is in lat. 5° 58′ S., and long. 124° 48′ E. It is low and covered with trees.

VELTY MARAM. Tam. A Travancore wood of a purple colour, sp. gr. 0·623, used only for firewood.—*Colonel Frith.*

VELTY TADDY. Tam. A Travancore wood of a brown colour, sp. gr. 0·635, used only for firewood.—*Colonel Frith.*

VELUTTA MANDARUM. Maleal. Bauhinia acuminata.

VELUTURU. Tel. Dichrostachys cinerea, *W. & A.*

VELVA MARAM, also Mududi. Tam. Swietenia chloroxylon ; Satin wood.

VEL-VELAM. Tam. Acacia leucophlœa, *Willd.* Its gum is the vel velam pisin.

VEL-VENGAY. Tam. Acacia speciosa, *Willd.*, also A. odoratissima, *Roxb. Willd.*

VELVET.

Velours,	Fr.	Volluto,	It.
Sammet,	Ger.	Balduwa,	Malay.
Makhmal,	Hind.		

Of this fabric there are two kinds, one made of silk, and one of cotton called velveteen.—*Faulkner.*

VENA. Hind. Rhazya stricta.

VENDA. Mal. Abelmoschus esculentus, *W. and A.*

VENDI, Tel. Silver.

VENDIAM. Tam. Fenugreek seed, seeds of Trigonella fœnum-græcum. Vendiam kiri. Tam. Leaves of Trigonella fœnum-græcum.

VENDIDAD. The book containing the religious code of the present Parsee or Zoroastrians. It has undergone three various processes of composition, of the Avesta, Zend and Pa-zend. The Avesta is of very ancient date, and is the ground-work of the present Vendidad, though all of it almost is post-Zertushtrian. In the course of time, several explanations and interpretations of the laws have been made, which acquired as much force as the original, and were incorporated with it. This is the Zend, and the incorporation of further explanations was styled the Pa-zend. Avesta means *direct higher knowledge, divine revelation*. Zend means the *explanation* of this, and Pa-zend the *supplements* to the Zend, or further explanation of the Zend doctrine. All the three steps exist in the present Zend Avesta, or more properly Avesta Zend. In recent years, the researches of Chevalier Bunsen and Professors Wilson and Max Muller and Mr. Wheeler seem to prove that much of the earlier history of two branches of the Aryan race are embodied in the Vendidad of the ancient Persians and present Parsees, and in the Vedas of the hindoos. According to Dr. Haug, the opening to the Vendidad, or Code of the Fire-worshippers of Iran dates from the most ancient times, and its contents are the reminiscences of the passage of the old Arians into India on the south, and into Persia on the southwest. According to Ch. Bunsen the Arian emigration from Sogd to Bactria took place prior to B. C. 5000, consequently before the time of Menes ; the immigrations into the Indus country about B. C. 4000, and the opening to the Vendidad describes the succession of the foundation of the fourteen kingdoms, the last and most southern of which was the land of the five rivers (the Punjab). According to Chevalier Bunsen, in the same way that political tradition represents that of the western aborigines (the Hamites and Shemites) so does the Arian one represent that of the Eastern tribes in the primeval land. The vast climatic change which took place in the northern countries is attributed in the Bible to the action of water. In the other, the sudden freezing up of rivers is the cause assigned. Both may have resulted from the same cause, the upheaving of the land by volcanic action, elevating portions and depressing into basins such as the Caspian Sea. Ten months of winter is now the climate of Western Thibet, Pamer and Belur at the present day, and corresponds with that of the Altai country, and the district east of the Kuen Lung, the paradise of the Chinese. The country at the sources of the Oxus and Jaxartes, therefore, is supposed to be the most eastern and most northern point whence the Arians came. Wherever the Indians may have fixed the dwelling places of their northern ancestors, the Uttarukuru, we cannot, he considers, venture to place the primeval seats of the Arians anywhere but on the slopes of the Belur Tagh, in the high-land of Pamer, between the 40th and 37th degrees of N. latitude, and 86° and 90° of longitude. On this western slope of the Belur Tagh and the Mustagh (the Tian.Shang or Celestial Mountains of the Chinese), the Haro-berezaiti (Albordsh) is likewise to be looked for, which is invoked in the Zend-avesta as the principal mountain and the primeval source of the waters. At the present day, the old indigenous inhabitants of that district, and generally those of Khasgar, Yarkand, Khoten, Turfan, and the adjacent highlands, are Tajik who speak Persian, and who are all agriculturists. The Turkoman either came after them and settled at a later period, or else they are aborigines whom the Arians found there. On this point Chevalier Bunsen likewise remarks that the opening of the sacred code of the Vendidad as certainly contains an historical tradition of the Arians as does the 14th chapter of Genesis an historical account of the oldest recorded war between Mesopotamia and Canaan. The Fargard is divided into two great parts, one comprising the immigration from the eastern and north eastern primeval countries to Bactria, in consequence of a natural catastrophe and climatic changes, the other the subsequent extension of the Arian dominions through eastern Central Asia, which terminated in the Punjab. The following passage contains a genuine description of the climate of the primeval land of the Arians, Iran Proper. There Ingromaniyus (Ahriman), the deadly, created a mighty serpent, and snow, the work of Deva—ten months of winter are there, two of summer. The following passage, which is omitted in the Huzuresh or Pehlevi translation—and which Lassen considers an interpolation, is irreconcileable with the above. The warm weather lasts seven months and winter five. The fathers of the Arians, therefore, originally inhabited Iran Proper, the land of Pleasantness, and they left it only in consequence of a convulsion of nature, by which a great alteration in the climate was caused. When the climate was altered by some vast disturbance of nature, the Arians emigrated. They did not however follow the course of the Oxus, or they would have come in the first instance to Bactria and not to Sogd. Their course, therefore, was more northerly. Its present climate is precisely what the record describes it to have been when the changes produced by the above commotion took place. It has only two months of warm weather. In the course of the Arians after their expulsion from the primeval country, between Sogdiana and the Sutlej, they formed, by the conquest of fourteen countries, as many kingdoms in the whole of the eastern part of central Asia and India Proper, in the country of the Indus and its confluents. In the intervening countries they passed amongst the Turanians (Scythians and Turcomans), and there is evidence that the inhabitants whom they found in India were likewise Turanians. The main direction of these travellers was southerly, and on the southern bank of the Caspian is a group the nucleus of the Arian Media. Professor Max Muller gives, as follows, the successive Arian settlements.

" *Sogdiana in Samarcand formed the first settlement of the Ariañs* : Sughda, afterwards written Sugdia and commonly Sugdiana, is pre-eminently "the country," as being the home of the Fire-worshippers. It is in the 38th degree of latitude, where Mara Kanda (Samarcand) is situated, a paradisiacal land, fertilized by the river Sogd, so that Sogd and Paradise are used synonymously by the later writers. The Vendidad (ii. verse 5) says it was created as the second best of the regions and countries.

"*The second settlement was in Mouru.* (Merv, Margiana.) This is Margiana (from the river Margus,) now Marghab (Margus-water,) Margus in the cuneiform inscriptions : a fruitful province of Khorassan, surrounded by deserts. In the Record (iii. verse 6) it is described as " the third best land, the mighty and pious Mouru, Marw,) . . . . Ahriman created there wars and marauding expeditions."

" *The third settlement was in Bokhdi* (Bactria.) It (iv. v. 7) is stated that the fourth best land was the fortunate Bokhdi, with the lofty banner : "here Ahriman created buzzing insects and poisonous plants." Bokhdi is certainly Bactria (though Burnouf had doubts about it,) the land of the Bactrians. The tall plumes" indicate the imperial banner (mentioned also by Firdousi,) and refer, consequently, to the time when Bactria was the seat of empire. Up to this time nothing is said about Media, though she conquered Babylon B. C. 1234.

" *Their fourth settlement was in Nisaya* (Northern Parthia.) It (v. verse 8) says " the fifth best land is Nisaya, there Ahriman created unbelief." This is the Nisaia of Ptolemy, famous for its breed of horses, commonly called Nisa, the renowned district of Northern Parthia, bordering on Hyrkania and Margiana. " The city of Nisæ is situated on the Upper Oxus. The term ' unbelief' in the record signifies the apostasy from pure fire worship. Here, therefore, the first schism takes place."

"*The fifth settlement in Haroya* (Aria.) Haroyu is Herat, of which frequent mention is made subsequently, and the Hariva of the cuneiform inscriptions. Its name has no connexion with the Arians, but comes from the river now called "Heri," abounding in water. The Greek district Aria comprises the larger portion of Segestan, and forms part of Southern Khorassan. In the Record (vi. verse 9,) it is mentioned that the fifth best land was Haroyu, the pourer out of water, here Ahriman created hail and poverty."

"*The sixth settlement in Vekereta*, (Segestan.) This country is the home of Rustum. Dushak is the capital of Segestan. To the south-east of it is the land of the Parikani known to the ancients as a part of the Saken country (Sakastene.) The greater part of it is now a desert, but it was once cultivated. Here again in the words of the Record, there may be allusion to a schism, which, in that case, would be the second historical one. The Record runs (vii. verse 10) "Vekereta, in which Duzhaka is situate; there Ahriman created the Pairiikka Khnathaiti." (Herod. iii. 94, compare Ritter, viii. 59.) Recent travellers have also found nomadic tribes between Media and Gedrosia, who worshipped the Peri (Fairies,) but were fire-worshippers also.

"*The seventh settlement in Urva* (Cabul.) The Record (in viii. verse 11) alludes to Urva, proved by Haug to be Cabul, the identity of which was previously unknown.

"*The eighth settlement in Khnenta* (Candahar.) (ix. verse 12) "Khnenta, where Vehrkana is situated." According to Haug, by this country Candahar is to be understood: Vehrkana cannot be Hyrcania, as is generally supposed, but is the city now called Urghandab situated in Candahar. The curse of Ahriman was pœderastism, a vice known historically to be un-Arian and Turanian.

"*The ninth settlement in Haraquaita* (Arachosia) (x. verse 13) (Haraquaita,) denominated the fortunate; the Harauwatis of the cuneiform inscriptions; the Arachosia of the classics. The work of Ahriman here was the burying of the dead. Another apostacy therefore from the true faith.

"*The tenth settlement in Hetumat* (district of Helmund.) (xi. verse 14) "Hetumat, the wealthy, the splendid," is the valley of the present Helmund, the Etymander of the classics. The mischief inflicted here by Ahriman was the sin of sorcery.

"*The eleventh settlement in Ragha* (Northern Media.) (xii. verse 16) "Ragha with the three races is doubtless the Rhagæ of Strabo and Ptolemy, the greatest city in Media" south of Teheran. This north-eastern portion of Media includes the passes of the Caspian. The possession of these passes was a protection to the other Arians, and at the same time the key to the whole of Media, and therefore Persia. The district is called also Choana (Qwan.) Ahriman established here unbelief in the spiritual supremacy of Zarathustra, another schism,—at all events another portion of ancient Arian history.

"*The twelfth settlement in Kakhra* (Khorassan.) (xiii. verse 17.) Kakhra is held by Spiegel and Lassen to be the district of Kihrem mentioned in Firdousi. Haug identifies it with the cities of Karhi in Khorassan. The evil done by Ahriman here was the burning of the dead. This was therefore an illegal practice, like the sin of the Arachosians, who were so profane as to bury their dead. All this implies the organization of an hierarchical power in Sogd and Bactria, although not a sacerdotal caste.

"*The thirteenth settlement in Varena* (Ghilan.) (xiv. verse 18.)" "Varena with the four corners." Haug has shown it to be Ghilan. The curse of Ahriman was irregular menstruation.

"*The fourteenth settlement in Haptu Hindu* (Punjab). (vi. verse 19) The Land of the Seven Hindu, that is, the country between the Indus and Sutlej. In the Vedas the country of the Five Rivers is also called the Land of the Seven Rivers. The traditional Greek names also are seven. The Indus and the Sutlej are each formed by the junction of two arms, which, in their earlier course, were independent. According to this view it stands thus:

1. Kophen (Kubha) 2. Indus, Upper.	I.	Indus.
3. Hydaspes (Bidaspes)	II.	Hydaspes.
4. Akesines (Asikni)	III.	Akesines.
5. Hyarotis (Hydraotis, Iravati-Parusni.	IV.	Hydraotes.
6. Hyphasis (Vipasa) 7. Saranges (Upper Satadru, Sutlej, Ghara)	V.	Hyphasis.

"But it is not only unnecessary to suppose, as Ritter does, that the country extended as far as the Sarasvati, but such a supposition would be at variance with history. It is now ascertained from the Vedas that the Arians passed the Sutlej at a very late period, and settled in what is now India. It was not till their fourteenth settlement after the emigration from the primitive country in the north, that they passed the Hindu-Kush and the Indus. The previous resting places form an unbroken chain of the primitive abodes of the Arians (the Free or the Land owners). The last link in those earlier settlements is the land of the Afghans, on the western slope of the Hindu-Kush. Lower down to the westward there is but one settlement necessary to secure their previous possessions, namely, the two districts of Ghilan and Masandaran, with the passes of the Caspian. This settlement more to the north-west (Ghilan and Masandaran) forms therefore also a connected group. Putting these two groups together, we shall find that there is no one single fertile district in the whole of eastern Central Asia of which the Arian race did not possess themselves, except Southern Media and all Farsistan or Persis. Now as history exhibits the Arian race spread throughout the whole of Media, but as dominant only in Persia, it follows that Ghilan and Masandaran formed the nucleus of these ancient possessions which afterwards became so important and celebrated. There cannot therefore be a more unfortunate theory than the one which makes Persia the original seat of Zoroaster and his doctrine. History as well as personal observations at the present time, supply unequivocal evidence of the Iranian having been the popular language in all these districts. The names in the Vendidad moreover, when compared with Sanskrit, turn out to be regular ancient formations, although like the old Bactrian formations, as preserved in India, they have been gradually weakened down. We know, lastly, from the inscriptions of the Achæmenidæ, several of them which have become historical and geographical designations at a later period. It is impossible under these circumstances to consider the Vendidad as a modern fiction, or as a fragment of some geographical compendium. The fact of their having suddenly retraced their steps from the south-west, and formed a connected north-eastern group about the Caspian Sea, would be inexplicable supposing it to be a fiction.

A line drawn from India along the Paropamisus and Caucasus Indicus in the east, following in the north the direction between the Oxus and Jaxartes, then running along the Caspian Sea, so as to include Hyrcania and Ragha, then turning south-east on the borders of Nisæa, Aria (i. e. Haria), and the countries washed by the Etymandrus and Arachotus, would indicate the general horizon of the zoroastrian world. It would be what is called in the fourth carde of the yasht of Mithra, "the whole space of Aria," vispem airyo sayanem (totum Ariæ situm). Opposed to the Arian we find in the zend-avesta the non-Arian countries (anairyao dainhavo) and traces of this name are found in the *Αναριαχαι*, a people and town on the frontiers of Hyrcania. Greek geographers use the name of Ariana in a wider sense even than the Zend-avesta. All the country between the Indian Ocean in the south and the Indus in the east, the Hindu-Kush and Paropamisus in the north, the Caspian gates, Karamania, and the mouth of the Persian gulf in the west, is included by Strabo (xv. 2) under the name of Ariana, and Bactria is thus called by him "the ornament of the whole of Ariana." As the zoroastrian religion spread westward, Persia, Elymais, and Media all claimed for themselves the Arian title. Hellanicus, who wrote before Herodotus, knows of Aria as a name of Persia. Herodotus (vii. 62) attests that the Medians called themselves Arii; and even for Atropatene, the northernmost part of Media, the name of Ariania (not Aria) has been preserved by Stephanus Byzantinus. Manu speaking of the Palava tribe of Kshatrya, who had neglected to reverence brahmans, styles them Dasya, whether they speak the language of the Mlech'cha or that of the Arya, and the people to whom he there alludes seem to have been Medes occupying the valley of the Indus. As to Elymais its name had been derived from Ailama, a supposed corruption of Airyoma. The Persians, Medians, Bactrians, and Sogdians all spoke, as late as the time of Strabo, nearly the same language, and we may well understand, therefore, that they should have claimed for themselves one common name in opposition to the hostile tribes of Turan. And when, after years of foreign invasion and occupation, Persia rose again under the sceptre of the Sassanians to be a national kingdom, we find the new national kings, the worshippers of Masdanes, calling themselves, in the inscription deciphered by De Sacy, "Kings of the Aryan and un-Aryan races," in Pehlevi, *Iran va Aniran*, in Greek, *Αριανων και Αναριανων*.

West of Armenia, on the borders of the Caspian Sea, we find the ancient name Albania. The Armenians call the Albanians Aghovan, and as *gh* in Armenian stands for r, or l, it has been conjectured by Bori that in Aghovan also the name of Aria is contained. This seems doubtful. But in the valleys of the Caucasus we meet with an Arian race speaking an Aryan language, the *Os* of *Ossethi* and they call themselves *Iron*. The Arians according to Bunsen (iv. 487) emigrated out of the country of the sources of the Oxus (*Gihon*) and Jaxartes, B. C. 11,000 to 10,000, and (iv. 491) about B. C. 7,250 to 5,000, the Arians separated into Kelts, Armenians, Iranians, Greeks, Slaves and Germans. According to Bunsen (iii. 584) the separation of the Arians was prior to their leaving Sogd. The emigration from Sogd to Bactria, after the separation, took place B. C. 5,000, consequently before the time of Menes. The immigration into the Indus country about B. C. 4,000, and Zoroaster's reform in Bactria about the time of Menes or half a century later; (*Bunsen* iii, 584) and he is of opinion that B. C. 5,000 to 4,000 the Arians formed their kingdoms in Central Asia, as far as Northern Media, Cabul and Candahar, and that B. C. 4,000 they migrated into the Indus country. Their history while residing in the Punjab, is contained in the Vedas.—*Wheeler's History of India, p.* 7. *Professor Max Muller's Lectures, p.* 69, 108, 201, 226, 228, 229, 230. *Calcutta Review* 1859. *Edinburgh Review. Bunsen's Egypt's Place in Universal History, vol.* iii. *p.* 449 *to* 601. *vol.* iv. *p.* 40 *to* 561.

VENCATAGHERRY, a town in the Carnatic 50 miles inland from the sea, and somewhat north, 70 miles of Madras.

VENERAH. MALAYAL. A jungle tree of Malabar which grows to about twenty-four feet in height, and eighteen inches in diameter. It is used in building native vessels and for other native purposes.—*Edye, Forests of Malabar and Canara.*

VENERIDÆ, a family of molluscs of the class Conchifera, of the following genera :—

Venus. *rec.* 176 sp. *fossil*, 160 sp.
? Volupia rugosa. *fossil.*
Saxidomus Nuttali. *rec.* 8 sp.
Cytheræa. *Syn.* Meretrix. 80 sp. Dione, *rec.* 113 sp. *fossil.*
Meroe. *Syn.* Cuneus. Sunetta, *rec.* 10 sp.
Trigona. *rec.* 28 sp. also *fossil.*
Sub-genus. Grateloupia. *fossil*, 4 sp.
Artemis. *Syn.* Dosinia, *rec.* 85 sp. *fossil*, 8 sp.
Sub-genera. Cyclina. *rec.* 10 sp. *fossil*, 1 sp.
Clementia. *rec.* 3 sp.
Lucinopsis. *Syn.* Dosinia. Mysia. Cyclina, *rec.* sp. *fossil*, 3 sp.
Tapes. *Syn.* Paphia. Pullastra, *rec.* 78 sp. also *fossil.*
Venerupis. *Syn.* Gastrana, *rec.* 19 sp. also *fossil.*
Petricola. *Syn.* Rupellaria. Choristodon. Naranio. *rec.* 30 sp. *fossil*, 12 sp.
Glaucomya. *Syn.* Glauconome, *rec.* 11 sp.

The genus Venus of Linnæus was arranged by him in the second section (*Bivalvia : Conchæ*) of his *Testacea Mollusca Simplicia, obtecta Testa Calcarea*, between *Donax* and *Spondylus.* Dr. J. E. Gray places the Veneridæ as the first family of his order Phyllopoda, with the following genera :—*Artemis, Cytherea, Meroe, Gratelupia, Trigona, Chione, Circe, Dosina, Mercenaria, Anomalocardia, Cypreia, Venus, Tapes, Venerupis, and Clementia. Recent and Fossil Shells, English Cyclopædia.*

VENETIANS, the people of Venice, who discovered a new and much shorter trade route to India, that down the river Euphrates, a route which even at the present day is declared by some to be the best that could be selected for communication between India and Europe. The Venetian merchants sailed from Venice to Tripoli, thence their goods were carried in caravans to Alleppo, which was a famous mart, whose reputation even Shakespeare did not fail to notice. From Alleppo the caravans made their way to Bir on the banks of the Euphrates. Here the merchandise was transferred to boats and conveyed down the river to a point near Bagdad on the Tigris. Bagdad being reached, the merchandise was then transferred to boats on the Tigris and carried down to Bussora and the island of Ormuz in the Persian Gulf. In those days Ormuz was what Bombay is to-day, the greatest emporium in India. Here all the velvets, cloths, and manufactures of the West were exchanged for the spices, drugs, and precious stones of the East. The wealth acquired by the merchants of Venice in their trade with the East excited the envy of the whole of Europe. The Portuguese especially spared no expense in their endeavours to discover a new route to India, and after nearly a century of the most indomitable exertions, they were fortunate enough, in the latter part of the fifteenth century, to find their way to Calicut by way of the Cape. The Indian trade of those days was in fact revolutionised. In a very short time, the trade routes by the Red Sea and the Euphrates were completely forgotten, and the cheapest and shortest route between Europe and India was the high sea : but, after making use of the sea route for 500 years, the route followed by the ships of king Solomon and Hiram king of Tyre, is again found to be the best.—*Madras Mail* 7th *June* 1870.

VENGA. TAM. Colosanthes Indica.

VENGAI MARAM. TAM.

Yepi? vriksha, CAN. | Yapa chettu, TEL.?

Pterocarpus bilobus, also Pterocarpus marsupium, *Roxb.* The latter furnishes a very useful heavy wood, of a reddish colour, employed in making doors and windows and in common use both for building and for furniture ; it is not strong, and when used for rafters, it should be cut very broad in comparison to its thickness.—*Mr. Rohde. MSS.*

VENGALAM. TAM. Bell metal.

VENGAYAM. TAM. Allium cepa, *Linn.*

VENGENDAH. TAM. MALEAL. A Malabar tree which the natives use for catamarans and in rafts, it is remarkably soft and spongy and not of much use or durability.—*Edye, Forests of Malabar and Canara.*

VENGULA CYAM. TAM. A Ceylon tree, grows to about twelve inches in diameter, and six feet high ; produces a fruit which is not made use of, and wood of little value.—*Edye, Ceylon.*

VENICE TURPENTINE. See Turpentine.

VENISE. FR. Damask.

VENCATESH, a name of the idol of Balaji or Vishnu at Triputy near Madras. The idol is also called Venkatramma Govinda, also Vencatachella. See Ballaji, Tripati.

VENKULLY. A town near Quilon. Its cliffs are immediately on the sea beach and are from 80 to 150 feet in height, nearly perpendicular. They have a cap of laterite 25 to 40 feet thick, below the laterite is a bed of several layers of sand of various colours very similar to the sands of the cliffs at Alum Bay, Isle of Wight. At the base of the cliffs are beds of lignite and carbonaceous clays.

VENNA. Tel. Butter.

VENNA DEVI-KURA. Tel. also Venna mudra, or Venna vedera, or Commelyna communis, *L.*

VENA KATTE TIGE, or Tappeta, Asystasia Coromandeliana, *Nees.*

VEN-PALLA. Tam. A Travancore wood of an ash colour, used for carving figures, sandals, &c.—*Col. Frith.*

VENTAKU. Can. Ventaku maram. Tam. Venteak. Anglo-Tam. The wood of this tree, Lagerstræmia microcarpa, is much used by the native carpenters for house building and masts for dowes, pattamahs, and other country vessels. It grows to ninety and one hundred feet long, and from twelve inches to three feet in diameter, it is perfectly straight and without branches, excepting at its top ; the leaves are small and very thick. This wood is not so durable as the poon, but it may be considered of the same texture, although it is very much lighter in colour, and in this respect much resembles the American red oak. —*Edye, Forests of Malabar and Canara.*

VENTILAGO MADERASPATENA. Gær. *Rox. Corr, W. & A. W. Ic.*

Erra chiratah	Tel.	Suralatige,	Tel.
Surugudu,	,,	Surati pette-tige,	,,

Grows throughout the E. Indies and Archipelago. The fishermen of Amboyna use the long climbing stems as substitutes for ropes.—*Roxb, Voigt.*

VENTRA, or Undra, Tel. Mimosa rubicaulis, *Lam.*

VENTRUKULU. Tel. Hair.

VENUTURU, or Veluturu. Tel. Dichrostachys cinerea, *W. & A.* Caillea cinerea, *G. & P.*

VENTURA, an Italian military officer who rose to the rank of general under Ranjit Singh.

VENTUS TEXTILIS. See Cotton manufactures.

VENUS. Lat. of the ancients. Copper.

VENUS SHELL. See Mollusca, Veneridæ.

VENUS, supposed to be from Vana. Sansc. the fair one, but the etymology of the word is also given from Banu, or Benu of Eastern Asia ; Hebrew, Benoth ; Syrian, Benos ; and the Greek and Latin, forming Venus.

In the temple of Venus at Cyprus, as shown by coins, the presiding divinity was placed in the porch, as in a kind of shrine or enclosure. The inscription on one coin, ΚΥΠΡΙΩΝ, indicates its having been struck at Cyprus. In the second Book of Kings, (xvii. 30) the sacred historian, when recounting the idolatrous practices of the people transported by the Assyrian monarch into the Samaritan cities, observes, that the " men of Babylon made Succoth-Benoth," which is literally rendered by Parkhurst, the tabernacle of the daughters, or the young women. Calmet however supposes that we are to understand Benoth as denoting a female idol, the Benos of the Syrians, and the Venus of the Greeks and Latins. The heathen strangers there made booths or tents in honour of the deity whom they worshipped, which, however obscene the rites there practised, were erected and preserved for religious purposes, and most likely to enshrine the object of their idolatrous services. A representation of pavilions consecrated to Venus, may be seen on many ancient medals. It seems, however, that these tents of Venus, the Succoth-Benoth of the Babylonians, the tabernacle of Moloch, and the silver shrines of Diana, mutually illustrate each other. The procession of idols was of frequent occurrence in antiquity, and was a matter of much importance and ceremony. The gods were carried in chariots, niches, or miniature temples, analogous to the shrines of the Ephesian idols. The image being in a small temple of wood, gilt, they carry out the day before to another building. Among the Egyptians, the shrine of Jupiter was annually transported over the river (Nile) into Libya, and after some days returned, as if the god himself were come from Ethiopia. The sacred procession of idols was also common among the Gauls, who, according to Sulpitius Severus, carried their gods into the fields, protected from the profanation of vulgar eyes by a white veil. These instances may suffice to show in what light we are to regard the shrines of the Ephesian artizans, viz. : as small models of the temple. Examples of the portable shrine are common in Russia, and in all the countries of the Greek church. The *ιερα* of the Greeks, says Dr. Clarke, as well as the tabernacles of the eastern nations, were sometimes not only portable, but they were so small, that the *κισταιεραι* used for enclosing them, could also be carried. The idols of many of the idol-worshipping races of the East Indies are generally kept in the interior of temples, and with the hindus, during festivals, the idol is placed in a car with or without wheels, or in a palanquin, and is carried out dressed up with all the jewellery of the temple, preceded by the deva-dasa and the brahmins. When outside the temple the worshippers burn camphor and present cocoanuts as offerings, and the dancing girls sing and dance before the god, and the brahmins chant passages from the Puranas. If at night, fireworks are also exhibited. Some of the cars or rut are of great size, with large wheels, beneath which devotees used to throw themselves. The village gods at stated periods are carried round the village boundaries. The Venus of the hindus is Rati.—*Milner's Seven Churches of Asia, p.* 132. See Osiris, Saraswati, Singhalese.

VENUS APHRODITE. See Lakshmi. Kama. Rati.

VENUS HAIR. Eng. Adiantum capillus veneris. See Ferns.

VENUS' LOOKING GLASS. Campanula.

VENUS' SLIPPER. Carinaria.

VENUTURA. Tel. Dichrostachys cinerea, *W. and A.*

VEPALA. Tam. Wrightia antidysenterica. See Veppalei.

VEPAM MARAM. Tam. Azadirachta Indica, also Melia azadirachta.

VEPPALEI. Tam. Connessi Bark, bark of Wrightia antidysenterica, the seed is called Veppalei arisi.

VEPUDU PACHCHA. Tel. Ocimum basilicum, *Linn.* Vittilu, also Rudra jada. Tel. The seeds.

VERA CRUZ. See Perim.

VERAETAL. A Ceylon tree about fourteen inches in diameter, and eight feet high. Its wood resembles mahogany, but is capable of a more brilliant polish; and it is used for superior purposes. It produces a fruit of little use.—*Edye, Ceylon.*

VERAJENDERPET, situated on the road leading to Cannanore from Mercara, 20 miles from the latter place. There is a cross road from Mysore, which joins the road to Cannanore a few miles below Verajenderpet, and along this road passes all the direct traffic between Mysore and the coast.

VERALI ADI PONG. Tam. Pandion haliætus, *Linn.*

VERAM PELOW. Maleal. Tam., the jackwood tree, common throughout India, and of value for its timber, its fruit and nuts. The wood when cut is yellow, but, when exposed to the air, turns as dark as mahogany, to which it is superior in brilliancy. It is generally used in articles of furniture for the Europeans, and for house work, and is considered handsome. The largest tree of this kind which Mr. Edye had seen was about three feet in diameter, and from thirty to thirty-five feet high. This was the wood which Tipu sultan used for his vessels at Honore, in Canara, where a naval depot was formed.—*Edye, Ceylon.*

VERAPATNI. See Hindu.

VERATRUM ALBUM. Linn.

Khirbak abiaz	Arab.	White Hellebore, Eng.

VERATRUM NIGRUM takes its name from the dark colour of its roots. The flowers are mostly white, dark purple, and green. It is cultivated in a rich garden soil by seed, or dividing the roots, which contain powerful medicinal properties.—*Riddell.*

VERÂVATI, an ancient name of Baroda.

VERA VENA. Hind. Dodonæa Burmanniana.

VERBASCUM THAPSUS. Linn.

This plant grows in Europe, in the Caucasus, Siberia, and in the Himalaya to 11,000 feet, a white-flowered variety occasionally occurring at the higher elevations. It is eaten by camels, goats, &c. In Bissahir the root is given as medicine.—*Drs. Roxb. Voigt. and J. L. Stewart.*

VERBENACEÆ. Juss. The plants in the East Indies comprising the Vervain Tribe, consist of 19 gen. 153 sp., viz. 40 Clerodendron; 1 Ægiphyla; 14 Callicarpa, 36 Premna; 26 Vitex; 8 Congea; 1 Symphorema; 8 Gmelina; 2 Tectona; 1 Phryma; 1 Streptium; 3 Verbena; 1 Stachytarpheta; 2 Zapania; 5 Lantana; 1 Asaphes; 1 Glossocarya; 1 Hymenopyramis; 1 Avicennia. Of the genus Verbena, only three species are natives of the East Indies, through several exotics are cultivated; these are pretty little flowering plants, but do not endure the heat and require shelter and good drainage. During the hot months they are propagated by layers and cuttings. The fine pink or crimson flowered V. aubletia, a native of N. America, is called the rose coloured Vervain; the common Vervain, V. officinalis, is known in N. India as Chiraita or Karaita; several species of the genus Clerodendron, Callicarpa, Premna, Vitex and Gmelina furnish useful products.—*Jaffrey.*

VERBENA CUNEATA. Willd. and Verbena nodiflora, *Linn.* syns. of Zapania nodiflora, *Linn.*

VERBENA OFFICINALIS. Common Vervain, grows throughout Europe, America, Persia, and the Himalaya. It is the ' holy herb' of Dioscorides, who ascribed great powers to it, especially in incantations. In most countries where it grows it seems to have been invested with extraordinary powers. It entered into the composition of various charms and love-philters, and has even now a popular reputation for predisposing persons favourably towards those who administer a dose to them. This plant is described as astringent, febrifuge, &c., but has fallen into just neglect. Still among the ancient Greeks and Gauls it held the highest place in popular estimation ; it was used to purify the altars, and formed the crowns of heralds and ambassadors. The Druids gathered it with the same marks of veneration as the mistletoe, next to which it was revered. Formerly employed extensively as a medicine it was also the base of numerous philters, or love potions, and hence derived its name of Veneris vena, or source of love. It is well known for its strong aromatic lemon scent. It grows from cuttings or layers, and no doubt would also from seed, as it blossoms freely.—*Riddell. Eng. Cyc. O'Shaughnessy, p.* 484.

VERBENA TRIPHYLLA. Lehkr.

Lemon-scented Verbena.	Aloysia citriodora.
Lemon-scented Vervain.	

Pila-Bhungara. Duk.

This plant is a native of Chili, an infusion when cold is administered as a cooling drink in fevers, slight catarrhs, &c.—*Eng. Cyc. Riddell.*

Vermicelli or Vermichelly is an Italian composition of various edible articles, reduced to a paste, and formed into slender wormlike pieces, from whence its name. The simian of India is made from wheaten flour. Locksoy is a kind of Vermicelli prepared from rice at Cochin China, and thence exported in considerable quantity to Japan and China, where it is much esteemed. It is transparent, and gives a consistence to soup. Chinese Locksoy is opaque, and less esteemed. *Hon'ble Mr. Morrison's Comp. Des. Mc Culloch's Com. Dic. p.* 1216.

VESICATORY BEETLES. See Cantharides, Mylabris.

VESPA MAGNIFICA. SM. An enormous hornet nearly two inches long was brought to Dr. Hooker at Choongtam in Sikkim, alive, in a cleft-stick, lolling out its great thorn-like sting, from which drops of a milky poison distilled: its sting is said to produce fatal fevers in men and cattle, which may very well be the case, judging from that of a smaller kind, which left great pain in his hand for two days, while a feeling of numbness remained in the arm for several weeks. It is called " *Vok*" by the Lepcha race, the common name for any bee: its larvæ are said to be greedily eaten, as are those of various allied insects.—*Hooker Him. Jour. vol.* ii. *p.* 26.

VESPERTILIO, singular, Vespertiliones plural. Lat. Bats of the order Cheiroptera.

VESPERTILIONIDÆ, a family of mammals, which may be thus shown;

Sub-fam. Scotophilinæ.

Scotophilus serotinus, *Jerdon.*
Vespertilio noctula, *Geoff.* | Silky bat, Eng.
„ serotinus, *Schr.* |
Europe, Himalaya, Tyne range beyond Mussoorie.

Scotophilus leisleri, *Jerdon.*
Vespertilio dasycarpus, Leisleri, *Blyth.* Hairy armed bat.
Tyne Range, Himalaya.

Scotophilus pachyomus, *Jerdon,* the thick muzzled bat of India.

Scotophilus Coromandelianus, *Jerd.*
Kerivoula Sykesii, *Grey. Ell.*
The Coromandel bat of all India.

Scotophilus lobatus, *Jerd.*
Vespertilio abramus, *Temm.*
The lobe eared bat of India.

Scotophilus fuliginosus, *Jerd.*
Nycticejus atratus, *Blyth.*
The smokey bat of Nepal.

Scotophilus fulvidus, *Ell.* Tenasserim.

Scotophilus pumiloides. China.

Noctulinia noctula, *Gray.*
Vespertilio lasiopterus, *Sch.* | V. labiata, *Hodgs. Bly.*
| V. altivolans, *White.*
The noctule bat of England, Nepaul. Flies high.

Large yellow bat. Eng.
Southern and Central India.

Nycticejus luteus, *Blyth.*
N. flaveolus, *Horsf.* | Bengal yellow bat, Eng.
All India, Assam, Burmah.

Nycticejus Temminckii, *Jerd.*
Vespertilio belangeri *Geoff.* | V. noctulinus,* *Is. Geoff.*
The common yellow bat of India, Burmah, Malayana.

Nycticejus castaneus, *Gr. Bly.*
Chesnut bat, Eng.
Bengal, Burmah, Malayana.

Nycticejus atratus, *Blyth.*
Scotophilus fuliginosus, *Bly.*
Sombre bat of Darjeeling.

Nycticejus canus, *Blyth.*
Sco. Maderaspatanus, *Gray.*
Hoary bat of all India.

Nycticejus ornatus, *Blyth.*
Harlequin bat, Eng.
Darjeeling.

Nycticejus nivicolus, *Hod. Hors.*
Alpine bat, Eng.
Near the snows of Sikkim.

Sub-Fam. Vespertilioninæ.

Lasiurus Pearsoni, *Horsf. Bl.*
Noctulinia lasiura, *Hodgson.*
The hairy winged bat of Darjeeling.

Murina suillus, *Jerd.*
N. lasiura, *Hodg.* | L. Pearsoni, *Bl.*
The pig bat of Darjeeling, Malayana.

Murina formosa, *Jerd.* The beautiful bat.
Vespertilio, *Hodg.* | Nycticejus Tickelli, *Blyth.*
Kerivoula, *Gray.* | N. Isabellinus, *Horsf.*
Central India, Nepal, Sikkim, Darjeeling.

Kerivoula picta, *Jerd.*
Vespertilio kerivoula, *Boddaert.* | Painted bat. Eng.
All India, Burmah, Malayana.

Kerivoula pallida, *Blyth.* The pale painted bat of Chybassa.

Kerivoula papillosa, *Jerd.* The papillose bat of Ceylon, Calcutta, Java, Sumatra.

Kerivoula tenuis ? *Tomes.*
Vespertilio tenuis.
Java, Sumatra.

Kerivoula Hardwickii, *Tomes.*
Vespertilio Hardwickii.
Java, Sumatra.

Vespertilio caliginosus, *Tomes.*
Mustachoed bat, Eng.
India.

VESPERTILIO PICTUS. See Cheiroptera.

VESPERTILIO MURICOLA. See Cheiroptera.

VESPIDÆ, a family of insects belonging to the order Hymenoptera. It comprises the species of the genus Vespa of Linnæus, of which the common wasp and the hornet are familiar examples. They are formed into a family by Latreille, under the name of Diploptera, afterwards changed into Diplopteryga by Kirby. They form the third and last division of the first sub-section (Prædones,) of the second section (Aculeata), of Hymenoptera, in Westwood's revision of Latreille's arrangement. When at rest they fold their wings throughout their entire length, whence their distinctive appellation. The wings of all the insects of the family have a similar neuration, their eyes are lunate, and there are glands at the extremity of the labrum. The four wings have one marginal and three perfect submarginal cells, with an incomplete terminal submarginal cell. Among the wasps are insects of the most dissimilar habits; some solitary, others living in societies, some phytophagous, others carnivorous. Such as are social rival the bees in the complicated instincts which regulate their societies. Among the wasps, structure, and not economy, is the real source of essential character. Each species of the solitary wasps comprises males and females only, and constitute the family Eumenidæ.

The genera Eumenes and Odynerus belong to it. The habits of the solitary wasps are interesting. Odynerus murarius (Vespa muraria) of Linnæus, makes a hole several inches deep in the sand, or in the sides of walls, constructing a tube of earthy paste at first straight, and then curved at its entrance. In this burrow it constructs its cells, and deposits in the cavity of the interior cell from 8 to 12 little green caterpillars, arranging them spirally in layers above each other. In the midst of these it deposits its eggs, then closes the mouth of the hole with the materials of the tube, which it had used as a sort of scaffold. The larvæ when hatched feed upon the caterpillars. The social wasps constitute the restricted family of Vespidæ of Westwood, the Polistides of Saint Fargeau. They live in numerous societies, consisting of males, females, and neuters, which are temporary, being dissolved at the approach of winter. The mandibles of the Vespidæ proper are not longer than broad, and are broadly and obliquely truncated at their extremities.—*Eng. Cyc.* See Vespa.

VESTA. See Osiris, Saraswati.

VESYA. TEL. The third of the three great sections of the hindoos, their third cast or caste. There are four of these, the brahmin, the chetria or kshetrya, the vesya and the sudra. The pure Vesya occupies himself in commerce and other peaceful avocations. See Vasya, Hindoo, India, Jogi, Vishnu, Yogi.

VETAL, the demon-god of the non Aryan races. Outside almost every hindoo village in the Dekhan, is a circle of large stones, sacred to Vetal.

VETIVER. TAM. Root of Khuskus or cuscus grass, Andropogon muricatus, *Retz.*

VETRA. SANS. Fruit of Calamus viminalis.

VETRO. IT. Glass.

VETTA. MAL. syn. of Chavica betle, *Mig.*

VETTELEI-CASTOORIA. TAM. Abelmoschus moschatus.

VETTE MARAM. MALAYALA. A Malabar tree that grows to about 12 feet high, and 8 inches in diameter. Its wood is very much like ebony in grain, and is much admired on account of its handsome dark streaks of black and brown, with white and yellow ground. Its flower is considered sacred, and is used for decorating the women on days of ceremony at the pagodas.—*Edye, M. and C.*

VETTILEI. TAM. Piper betle, Betel leaf. Chavica betle, *Mig.*

VETTILEI-KUSTURI. TAM. Abelmoschus moschatus.

VETTIVER. MALEAL. TAM. Andropogon muricatus, or Anatherium muricatum. See Graminaceæ. Kaskas.

VETTUTNAD. See Kummaler.

VETUSTA or Betusta, the Jelum or Hydaspes, one of the sacred rivers invoked by a brahmin, when saying his daily prayers.

VETUVAR, a forest and hunter tribe in Malabar and Konkan; they are predial slaves; a subdivision of the Vetuvar is employed in agriculture, also as boatmen and salt-makers.

VEYNGAH. TAM. Dalbergia latifolia.

VEYRUH. TAM. Careya arborea.

VEYTTY. TAM. A Travancore wood of a light brown colour, used for making carts, ceilings, &c.—*Col. Frith.*

VELVET-INSECT, the Bir-buti of the hindoos, about the size of the nail of the little finger. It appears in the rains, and is of a bright red colour and has a soft unctuous feel. An oil is extracted from the unctuous bodies, which is used as a vesicating and inflammatory agent.

VEMA DONDA. TEL. Echinops echinatus, *Roxb.*

VEMBAGAM. TAM. Lagerstrœmia microcarpa.

VEMBAH. TAM. A tree of Travancore which grows to about twenty-feet long and fifteen inches in diameter; its wood is close grained and of a yellow tinge, and used for native purposes. The bark is used by the natives in eruptions of the skin, and also to purify the blood after fevers, for which it is considered most valuable.—*Edye. M. & C.*

VEMBU. MALEAL. Acorus calamus, *Linn.*

VEM-MARAM. TAM. A Tinnevelly wood of a brown colour sp. gr. 0·786, used for building purposes.—*Colonel Frith.*

VEMPA. TEL. Azadirachta Indica.

VEMPALI. TEL. Tephrosia purpurea, *Pers.* The name refers to the genus rather than to a particular species, but is generally applied to the commonest species.

VEMPU. MAL. Melia azadirachta, *Linn.*

VENA, also Avena. IT. Oats.

VENARAH. MALEAL. A jungle-tree of Malabar, which grows to about 24 feet in height, and 18 inches in diameter. It is used in building native vessels and for other native purposes.—*Edye. M. & C.*

VENDAH. MALEAL. TAM. Abelmoschus esculentus. Venda-kai, also Bendi kai. TAM. its pods.

VI. SANSC., a privative term, as Viragi, without desire; the a privative of Latin.

VIBAHAVA. See Sri Sampradaya.

VIBBITAKA. SANS. Terminalia rubrica.

VIBHISHANA, brother of Ravana, who sided with Rama, and was therefore seated on his brother's throne.

VIBHUTI, also Vibudi. TAM. The sacred ashes of burnt cowdung with which the hindu saiva sect besmear their forehead, and sometimes their whole body. See Jangam. Tripundra.

VIBURNUM, a genus of plants belonging to the natural order Loniceraceæ. The species consist of shrubs with opposite petiolate leaves and corymbose flowers. All the varieties of Laurustinus are hardy evergreen shrubs, and bear the climate of Great Britain well; most of them blossom from November till April, and sometimes during May and June. Drs. Wight and Voigt give Viburnum acuminatum, capitellatum, hebanthum, lantana, opulus, Wightianum, adenophyllum, Colebrookianum, punctatum, cotinifolium, interregnum of Penang, odoratissimum and nervosum of China, fœtidum of Burmah, and mullaha of Dehra.—*W. Ic. Eng. Cyc. Voigt.*

VIBURNUM COTINIFOLIUM. *D. Don.*

V. polycarpum, *Wall.*

Kal-kut,	HIND.	Rich-uklu,	HIND.

A plant of Kaghan and the Himalaya.—*Dr. St.*

VIBURNUM FŒTENS.

Aklu of	KAGHAN.		

V. cotinifolium, V. fœtens, and V. stellionum form the underwood of forests in the N. W. Himalayan valleys. The wood is used chiefly for fuel. The berries of both V. fœtens and V. cotinifolium are edible.—*Mr. Powell, Hand-book. Drs. Cleghorn and Stewart.*

VICEROY. The title of the ruler of British India.

VICHITRA VIRYA married Amba and Ambahka, daughters of the king of Kasi, who had issue, after his death, by his half brother Krishna dwaipa yana or Vyasa, Dhirita rashtra and Pandu, whose wives bore the five Pandava, viz:

Yudishtira.	Nakul	who founded the Magadha line.
Arjuna, father of Parikshita.	Sahadeva	
Bhima.		

Vichitravirya had no male offspring. Of his three daughters, one was named Pandea; and Vyasa being the sole remaining male branch of the house of Santana, took his niece and spiritual daughter Pandea to wife, and became the father of Pandu, afterwards sovereign of Indraprestha. Arrian gives the story thus: "he (Hercules) had a daughter when he was advanced in years, and being unable to find a husband worthy of her, he married her himself that he might supply the throne of India with monarchs. Her name was Pandea, and he caused the whole province in which she was born to receive its name from her." This, says Tod, is the very legend contained in the Purana of Vyasa (who was Heri-cul-es, or chief of the race of Heri) and his spiritual daughter Pandea, from whom sprung the grand race of the Pandua, and from whom Delhi and its dependencies were designated the Pandua sovereignty. Her issue ruled for thirty-one generations in direct descent, or from 1120 to 610 before Christ; when the military minister, connected by blood, was chosen by the chiefs who rebelled against the last Pandu king, represented as "neglectful of all the cares of government," and whose deposition and death introduced a new dynasty. Two other dynasties succeeded in like manner by the usurpation of these military ministers, until Vicramaditya, when the Pandua sovereignty and era of Yoodishtra were both overturned. According to a writer in the Westminster Review, Vichitravirya died childless, and Vyasa begot two sons by his two widows, and a third son by a slave girl whom the third widow Ambika substituted for herself. This practice of a relative raising children for a deceased childless relative is sanctioned by Manu, who says, "on failure of issue by the husband, the desired offspring may be procreated either by his brother or some other near relative, called Sapinda, in the wife who had been duly authorized." Pandu, also, when lamenting his childlessness, says to Pritha, "in distress men desire a son from the oldest brother-in-law." Manu, regarding the choice of a husband, enjoins parents to select a handsome son-in-law; and adds, three years let a damsel wait, though she be marriageable, but after that term let her choose for herself a husband of equal rank. Another mode of ancient hindoo marriage was the Swayamvara or self choice, where a girl chose her own husband. In the Mahabharata, the cases of Pandu with Pritha, Yudhishthera with Devika, Sahadeva with Vijaya, Sini and Devaki, Nala and Damayanti, Draupadi and Arjuna are mentioned. Manu describes eight modes of marriage, viz., Brahma, Daiva, Arsha, Prajapatya, Asura, Gandharva, Rakshasa, and the eighth and worst Paisacha; the first six for a brahman, the four last for a warrior, and the same four, the Rakshasa excepted, for the third and fourth class.—*West. Rev. April* 1868. *Prinsep by Thomas. Tod's Rajasthan, vol.* i. *p*. 31.

VICIA, a genus of plants belonging to the natural order Fabaceæ. The species are usually climbing herbs with abruptly pinnate leaves, with many pairs of leaflets. Vicia biennis, Biennial vetch, has about 12 lanceolate glabrous leaflets. Vicia Bithynica, rough podded purple vetch, has stalked, mostly solitary, flowers. Vicia cracca is the tufted vetch.

Vicia lutea, rough-podded yellow vetch, has sessile solitary flowers. Vicia pisiformis, pea-like vetch, is quite a smooth plant. Vicia sativa, common vetch, or tare, has leaves with tendrils. Vicia sepium, bush-vetch, has flowers mostly in fours, somewhat stalked. Vicia sylvatica, the wood vetch, has many flowered peduncles longer than the leaves. About fifteen species of Vicia are known ; the garden bean, Vicia faba or Faba vulgaris, grows wild about the Caspian Sea, but, throughout the world, is largely cultivated for food.—*Riddell. Hog.*

VICIA FABA. LINN.

This plant, a native of the environs of the Caspian Sea, is cultivated in India. Its flowers are large, white, striped, and dotted with black.

VICIEÆ. See Ervum.

VICOA, a genus of plants belonging to the natural order Matricariaceæ. Dr. Wight gives Vicoa Indica, a native of peninsular India.

VICRAMA. See Krishna.

VICRAMADITIYA or Vikramaditya, a learned monarch and an astronomer, whose capital, Oujein, was, about his time, overwhelmed by a violent convulsion of nature. Hindu legends account for that circumstance, and his origin and birth are described in the 6th vol. of the Asiatic Researches. This prince has given his name to an era, and he is said to have flourished 135 years before Salivahana. Its epoch falls when 3044 years of the Caliyug had expired. The era Vicramaditya is little used in the peninsula of India, although its current year is generally inserted at the head of the calendar. In those provinces where it is current, it serves to number the luni-solar years, in the same manner as the era Salivahana in the Carnatic does for the solar ones. Vicramaditya reigned B. C. 56 —*Cole. Myth.Hind. page* 400. *Warren's Kala Sankalita. As. Res. vol.* 6.

VICTORY ISLAND, in the China Sea, is in lat. 1° 34′ N, and about long. 106° 22′ E. It is of moderate height and covered with wood.—*Horsfield.*

VICTORIA REGIA, one of the Nymphæaceæ, is a beautiful water lily of S. America, but is now to be found in many parts of India. It was first successfully raised in the garden at Calcutta from seed sent by Dr. Wallich from England on the 9th of September 1851. It was received and sown in the garden on the 6th of November following, where it lay in a dormant state until the 23rd of April 1853. On the 13th of May same year, the seedling had made a healthy growth, and was transferred on that date to the mound prepared for it in the tank. The largest leaf when planted out was little more than three inches in diameter. The total number of leaves produced up to the 5th of September were forty-four, fifteen of which were on the plant in different stages of development, when the first flower had made its appearance on the surface of the water, the largest leaf produced up to that time measured4 feet 5½ inches in diameter. The first flower bud appeared partly above the water on the morning of the 6th September, and by sunset the same evening had partly expanded ; the flower closed up the next morning, and finally opened again at sun-set the same evening.—*Journal of the Agri Horticultural Society Cal., vol.* 8, 1853. *Riddell.*

VIDGNANI. See Lakshmi.

VIDI MARAM. TAM. MALEAL. Cordia myxa, *Linn.* The wood is soft, and one of the best for affording fire by friction. The bark is deemed a mild tonic. The dried fruits of this and of *C. latifolia* have long been used as a medicine in India under the name of Sebistan or lobesten. They are slightly laxative, and are much esteemed as a pectoral. The seeds are deemed an infallible remedy in ringworm. The pulp is equally as aperient as that of the Cassia fistula.—*Roxb.* i. 560. *Simmond's Dict.*

VIDRIO. SP. Glass.

VIDRUMA, also Prabala, SANS. Coral.

VIDYA. SANS. Learning. Amongst the hindu there are eighteen Vidya of true knowledge or sciences, and some branches of knowledge, falsely so called. The first four are the Vedas, which are entitled, in one compound word, Rigyajushsamat'harva, or, in separate words, Rig, Yajur, Sama, and At'harvana. The Rig-veda consists of five sections ; the Yajur veda of eighty-six ; the Sama veda of a thousand, and the At'harvana veda of nine, with eleven hundred shac'ha, or branches, in various divisions and sub-divisions. The Vedas, in truth, are infinite ; but were reduced by Vyasa to this number and order: the principal part of them is that which explains the duties of man in a methodical arrangement ; and in the fourth is a system of divine ordinances. From these are deduced the four Upa-veda (Upaveda, Upanga, Uppuran, are terms which infer a work deduced, respectively, from its principal : up, like our sub, implies inferiority) namely, Ayush, Gandharva, Dhanush, and St'hapatya. The first of these, the Ayur-veda, was delivered to mankind by Brahma, Indra, Dhanwantari, and five other deities ; and comprises the theory of medicine, with the practical methods of curing diseases. The second, the Gand'harva, treats of music, was invented and explained by

Bharata : it is chiefly useful in raising the mind by devotion to the felicity of the divine nature. Dhanush, the third Upa-veda, was composed by Viswamitra, on the fabrication and use of arms and implements handled in war by the tribe of Chatriya. Viswakarma revealed the fourth, in various treatises on sixty-four mechanical arts, for the improvement of such as exercise them. Six Anga, or bodies of learning, are also derived from the same source ; their subjects chiefly are—1, of the pronunciation of vocal sounds ; 2, detail of religious acts and ceremonies ; 3, grammar ; 4, prosody ; 5, astromony ; 6, on the signification of difficult words and phrases in the Vedas. Lastly, there are four Upanga, called Purana, Nyaya, Mimansa, and Dhermashastra, eighteen Purana (that of Brahma and the rest) were composed by Vyasa, for the instruction and entertainment of mankind in general. Nyaya is a collection of treatises, in two parts, on metaphysics, logic, philosophy, &c. Mimansa is somewhat similar, divided intot wo parts ; the latter, called Uttara, abounding in questions on the divine nature, and other sublime speculations, was composed by Vyasa, in four chapters and sixteen sections. It may be considered as the source of all the Anga ; it exposes the heretical opinions of sophists ; and, in a manner suited to the comprehension of adepts, it treats on the true nature of Ganesa, Bhascara or the Sun, Nilakanta, Lakshmi, and other forms of one Divine Being. The body of law, called Smruti, consists of eighteen books, &c. &c. delivered for the instruction of the human species, by Manu and other sacred personages. As to ethics, the vedas contain all that relates to the duties of kings ; the Puranas what belong to the relation of husband and wife ; and the duties of friendship and society (which complete the triple division) are taught succinctly in both. This double division of Anga and Upanga may be considered as denoting the double benefit arising from them in theory and practice. The Bharata and Ramayana, which are both epic poems, comprise the most valuable part of ancient history. Sanc'hya is two-fold, that with Iswara, and that without Iswara, called Patanjala, and Kapita : the latter, in six chapters, on the production of all things by the union of Prakriti, or Nature, and Purusha, or the first male, &c. These books contain infinite contradictions. The Mimansa is in two parts, the Nayaya in two, and Sanc'hya in two ; and these six schools comprehend all the doctrines of the theists. Lastly appears a work written by Budha : and there are also six atheistical systems of philosophy, entitled Yogachara, Sidhanta, Waibhashica, Madhyamica, Digambara, and Charvaka ; all full of indeterminate phrases, errors in sense, confusion between distinct qualities, incomprehensible notions, opinions not duly weighed, tenets destructive of natural equality, containing a jumble of atheism and ethics ; distributed, like all orthodox books, into a number of sections, which omit what ought to be expressed, and express what ought to be omitted ; abounding in false propositions, idle propositions, and impertinent propositions. The Vedas consist of three Kanda, or general heads, namely, Carma, Gnyana, Upashasana ; or Works, Faith, and Worship. To the first of which, the author of the Vidyadesa, or view of learning, a rare Sanskrit book, wisely gives the preference ; as Manu himself prefers universal benevolence to the ceremonies of religion.—*Cal. Review. Wilford. As. Res. vol* ii. *p.* 302. See Hindoo, Learning, Saraswati, Veda.

VID'HARBHA, an ancient territory, of which the modern Berar forms a part. Vidarbha is always identified with Berar, but the limits of the province in that case included the adjoining district of Beder, in which the name of Viderbha or Biderbha is traceable. Local traditions also assert that the ancient capital still called Beder, is the same as Vidharbha.—*Hind. Th. vol.* ii. *p.* 11.

VIDYA-DESA. See Vidya.

VIGNE, a traveller who wrote on the territories of Persia, India, Kashmir, the Punjab, Kabul, Ladak and Afghanistan. His works abound in valuable information. See Kamidanda, Kashmir, Koch, Kohistan, Shalimar, Suspension Bridges, Yak.

VIGHNESVARA. Isvara's elder son; his image is often standing in the temples of the Grama-devata, or village deities.

VIGRAH, or Visala Deva. See Inscriptions.

VIGRAHA RAJA. See Inscriptions.

VIGRAHAM. TAM. Vigram. TEL. Idol.

VIHARA. The budd'hist vihara or monasteries are of two kinds :—1st, Cave vihara, of which several magnificent specimens have been published by Mr. Fergusson ; and 2nd, Structural vihara, of which some specimens still remain at Sanchi, but in a very ruinous condition.

(*a.*) The Vihara or monastery caves, of the first class, consist of (1) natural caverns or caves slightly improved by art. These are the most ancient, and are found appropriated to religious purposes in Behar and Cuttack : next (2) a verandah opening behind into cells for the abode of priests, as in Cuttack and in the oldest vihara at Ajunta ; the third (3) has an enlarged hall supported on pillars. The most splendid of these caves are those of Ajunta; though the Dherwara at Ellora is also fine, and there are some good specimens at Salsette and Juner. The word vihara is supposed by some to be the source of the name Bahar. See Ajunta; Buddha; Caves; Temple.

VIJAYA, a buddhist prince who conquered Ceylon, his title taken from the Sanscrit word, written similarly, meaning conquest. There was a pepul tree at Buddah Gaya, a shoot from which, known as the Bo-tree, has been cherished at Anarjapura for twenty centuries, and in the courtyard of every buddhist vihara and temple of Ceylon, leaves from it are preserved as objects of veneration. A system of caste was introduced by king Vijaya amongst the Ceylon buddhists, which still prevails there, though directly opposed to buddhist doctrines and not existing in any similar form in other buddhist countries. See Inscriptions for Vijaya Bhatta, Vijaya Chandra, Vijaya mandir Udayapur, Vijaya Pala, Vijaya Sah, Vijaya Sena, Vijaya Sinha.

VIJNANESWARA BHATTA, flourished in the tenth century of the christian era, author of the Mitakshara, a commentary on the law book of Yajna Valkya.

VIJAYANUGGUR. A ruined town in the Bellary district, known at one time as Bijanagar, also written Vijayanuggur, Vijianagar, properly Vidianuggur or the town of learning, was founded in the reign of Mahomed Toghlak, according to one account, by two fugitives from Telingana, but according to Prinsep, in 1338 by Bilal Deo, of Karnata, who resisted Mahomed Toghlak and founded Vijianuggur. The family genealogy deduces a descent in the direct line from Pandu of the lunar dynasty, and imperfectly follows the Pauranic lists to Chandrabija, the last of the Magadha rajahs. The first in authentic history is Nanda, A.D. 1034, who founded Nandapoor and Warangal. Between A.D. 1524 and 1565, Rama rajah was killed in an invasion of Nizam Shah Bhairy and Imad-ool-Mulk. In the time of Tipoo, Sultan Khan took the country, and in 1829 the dynasty became extinct with Vera Venkatapati Rama. In 1347, Krishna Rai ruled there: in 1425, Deva Rai: in 1478, Siva Rai. Vijayanuggur was the seat of the last great hindu empire in India. The sovereigns claimed to be of the Yadu race. In the beginning of the 16th century, they granted to the E. I. C. the tract around Madras, engraved on a gold plate, which was lost in 1746 when Madras was captured by the French under Labourdonnais. Towards the fifteenth century, Vijayanuggur had become the capital of a great hindu power, which ruled over the hindu chiefs to the south of the territories of the Adil Shahi, Nizam Shahi and Kutub Shahi kings of the Dekhan. In the middle of the 16th century these three mahomedan kings fearing the growing power of Rama rajah, the sovereign of Bijianuggur, made war against him; Rama was then in his 70th year. These three mahomedan kings were offended at the new currency of Bijianugur, the obverse of which contained the effigy of a pig, and which were distributed to the Patans that were employed under Rama. He met the confederates at Talicottah on the 25th January 1565 with a great army of 70,000 horse, 90,000 foot, 2,000 elephants and 1,000 pieces of cannon, but he was defeated with a loss of 100,000 men, and was taken prisoner. The authors, Khafi Khan and Shahab-ud-din, state that the elephant on which he was mounted ran away with him into the confederate's camp. He was beheaded at Kala Chabutra in the Raichore Doab, and his head remained for 200 years at Bejapore as a trophy. Vijianuggur sank into an insignificant place, and is now known as the ruins of Humpee. The rajah's brother, however, took refuge in Penicondah, and subsequently at Chandragiri, whence the English merchants obtained the grant of the ground on which Madras was built. The descendant of Rama rajah is the rajah of Anagoondee, whose title is Sree Mudrajadhee Rajah, Raja Paramaswara, Sree Veerapratapa, Sree Veera Teroomala, Sree Veeravenkata Ramarawya, Dava Maharawya Sumstan Vedaya Nagarum. The Anagoondi rajah claims to be a Chetrya, and to have relationship with the maha rajah of Vizianagram. Anagoondi has for the past two hundred years been called Vijianagar, but the Vijianagar of the great hindu dynasty is now known as Humpee, about 30 miles from Bellary.—*Thomas' Prinsep. Wh. H. I., p.* 459. See Humpee.

VIJAYA. SANS. Cannabis sativa, *Linn.*

VIKRAMADITYA. About this great king India affords nothing but fables, but a passage of the Periplus mentions that his capital was Ozene (Ujein), and it is known that he extended his empire to Cabul about B. C. 56. His dominion in the Cabul valley must have been temporary; his empire fell to pieces after his death, and nearly a century elapsed before Chandra Sena restored the sovereignty of Hindustan in its unity. Vikramaditya is supposed to have ascended the throne 57 years B. C., and the natives of Northern India count their luni-solar years from his accession. Vikramaditya was a descendant of one of the Agni-Kula chieftains called Pramara or Pura. He was a great monarch, and encouraged learning. All the most readable Sanscrit hindu works, however, the drama, the lyric, the sentimental and philosophical Kavya, as Nala and the Bhagavad Gita, the romantic histories and historical romances, the fables, Hitopadesa, Vetala, Panchavinsati, and so forth, and most of the works on science, belong to the first ten centuries of the christian era. See Inscriptions, Kalidasa, Khutri, Orissa, Pali, Malwa.

VIKRAMADITYA ERA, or Samvat or Sambut era B. C. 56, is in general use throughout Telingana and Hindustan. The prince from whom it was named was of the Tuar dynasty, and is supposed to have reigned at Ujjain (Ujjayini) 135 years before Salivahana, the rival founder of the Saka era, south of the Nerbudda (Narmada.) The Vikramaditya or Samvat era commenced when 3044 years of the Kali-yug had expired; *i. e.*, 57 years B. C., so that if any year, say 4925 of the Kali-yug be proposed and the last expired year of Vikramaditya be required, subtract 3044 therefrom and the result, 1881, is the year sought. To convert Samvat into Christian years, subtract 57; unless they are less than 58, in which case deduct the amount from 58, and the result will be the date B. C. Fable represents this monarch to have sat upon a fairy throne, borne upon the shoulders of interdicted angels from Indra's court in heaven, and to have raised spectral agents, like Alla-ud-din in the Arabian tale, for the execution of his behests.

He derived his title of Sakari from his exploits against the Sacæ (Sakæ.) The Sacæ race is still perhaps preserved pure in the wilds of Tartary, between Yarkhand and the Mansarowar lake, where the Jok-po called Kelmak (Calmuc) by the mahomedans, continue to be dreaded by the people of Tibet. He was a Puar Rajpoot.—*Thomas' Prinsep, p.* 157. *Tr. Hind. vol* ii. *p.* 143. See Junagurh, Kabul, Sumitra.

VILLAGE. Agriculturists in northern India dwell in village communities, in Central India they are village proprietors, and in Southern and Western India they are ryots under the ryotwari system, much like the peasant proprietors of Europe. Goozerat cultivators do not live, as those of European countries do, each upon his own farm, but are invariably concentrated into villages. By the term village is strictly meant, not merely the collection of dwellings which the cultivators inhabit, but the whole area which is in their occupation. The ordinary terms for a village, viz., Gramamu, Gramam, Gram, Gam, Gauw, Gaon, are derived from the Sanscrit. The Grama devata, the tutelar deity of a village, is sometimes one of the hindu pantheon, sometimes as in the south of India, it is Hanuman; sometimes one of the Ammun, often a shapeless stone or piece of wood. The gramma devata are generally on the outskirts of the villages, frequently beneath a tree, and are generally exposed to the open air without any covering temple. So long as the affairs of the community are ordinarily prosperous and no calamity threatens they are content with the worship common to the sect to which they belong, but in seasons of trouble the gramma devata are largely resorted to. When the calamity is general, such as a drought or a pestilence, or a murrain amongst the cattle, the entire village will repair to the village deity and seek by prayer and offerings to obtain release. All the Assamese regard high trees and sequestered groves as the haunts of spirits.—*Forbes' Ras Mala* or *Hindoo Annals, vol.* ii. *p.* 241. *Wils.*

VILLARSIA, a genus of plants belonging to the natural order Gentianaceæ, named after Villars, a French botanist. There are about 16 species of this genus either aquatic or marsh plants, with alternate entire leaves and yellow flowers, inhabitants of all parts of the world. One only is a native of Europe; Villarsia Indica, aristata, and nymphæoides occur in every part of India, and afford a good bitter.—*O'Sh. p.* 450. *Eng. Cyc. Voigt. Hog.*

Nymphæa, like Villarsia, is a floating plant, with orbicular-cordate leaves, the peduncles single-flowered and aggregate, the segments of the corolla ciliate. It is found in ditches and slow-running streams, and is a native of Denmark, Holland, Sweden, Germany, Piedmont, Siberia. In Great Britain it is found in the Thames in the recesses of the shores near Walton bridge, near Botley bridge, Godstow bridge, and Hinksey ferry. It occurs also in the fens of Lincolnshire and in Yorkshire, is very abundant in Holland, frequently covering large tracts of the canals with its beautiful yellow flowers and dark-green leaves, grows in every part of Hindoostan ;in Kashmir it vegetates on the lakes, and is given as food to cows, in the belief that it increases their milk. It is a beautiful plant, and may be easily cultivated. It has a large yellow flower, which is curiously plaited.—*Thirty-five Years in the East by Dr. Honigberger p.* 364. *Dr. J. L. Stewart.*

V. vulgare. *Rœm. & Sch.*	Tranna of RAVI.

Not uncommon in parts of the western Punjab Himalaya from 5000 to 9500 feet. In some places the natives commend its khushbo (perfume), which is really a rank heavy smell given out when it is bruised.—*Dr. J. L. Stewart.*

VINDHYA. A range of mountains which runs south and north between 24° and 28° N. L., from the neighbourhood of Ahmedabad towards the banks of the Jumna, near Delhi. Running from the gulf of Cambay north-easterly towards the Ganges, the range separates Hindustan proper from southern India, and forms the northern boundary of the valley of the Nerbudda river, extending from Guzerat on the W. to the basin of the Ganges on the E., and comprised between the 22nd and 25th parallels of latitude. The average height 1,500 to 2,000 ft. Chumpaneer, 22° 34′, 73° 41′; 2,500 ft. ; Crest of Jam Ghaut, 2,300 ft. ; Mountain in Bhopal, 2,500 ft. ; Chindwarra, 2,100 ft. ; and Patchmaree, vaguely stated to be 5,000 ft. ; but this is probably an exaggeration ; Dokgur, stated to be 4,800 ft. ; Putta Sunka, and Choura Doo, the highest, conjectured at 5,000 ft. ; Amarkantak, a jungly table-land computed to be 3,463 ft. ; Leela, a summit in Lanjhee hills, 21° 55′, 80° 25′, 2,500 ft. ; another of the same hills, in 21° 40′, 80° 35′, 2,400 ft. The chain forms the southern buttress of the plateau of Malwah, Bhopal, &c. In the Saugor and Nerbudda territories its crest is but the brow of this table land ; but in the western part it rises a few hundred feet above the high land on its northern side. The passes that have been made over this range are, for the most part, bad. The geological formations are granitic and sandstone, overlaid by trap rock. The Vindhya mountains as they extend across Central India, throw out branches behind Agra and Delhi to the north. The Vindhya mountain chain is also called Bindh, and holds an important position both in the mythology and geography of India. According to some authorities they are called Bindhya, because they appear to obstruct the progress of the sun. The course of the Nerbudda (Narmada) river indicates the direction of the principal range, but the mountainous tract called Bindhya spreads much more widely, meeting the Ganges in several places to the north, and stretching across the country in such a manner as to form the base of an irregular triangle, the two other sides of which are the Coromandel and Malabar chains. Connected with the western limits of the Vindhya range, by a curved line of hills, are the Aravalli mountains, which stretch almost to Delhi and serve as a barrier between Central India and the western desert. The eastern portion of the Vindhya chain is a spreading table-land from which spurs descend to the north and south, the latter separating the different valleys of Orissa. The table-land of Chota Nagpur averages 3,000 feet ; and westwards near Sirgujah is higher. Hazaribagh is about 1,800 feet, and Parisnath hill on the east is about 4500 feet ; the most easterly spurs approach the Ganges at Monghyr, Bhaghulpur and Rajmahal.

Professor Max Müller is of opinion that when the Arian tribes immigrated into the north of India, they came as a warrior people—vanquishing, destroying and subjecting the savage and despised inhabitants of those countries. But that, in the countries south of the Vindhya, their entry was in the way of colonization, and instead of introducing their own Sanscrit language, they adopted those of the southern nations—refined and improved them till they even rivalled the Sanscrit in perfection, though there remain up to the present day, in some parts of the interior of the peninsula, savage tribes never reached by the superior civilization of the Arian. But, although the Arian conquerors seem to have crushed and extinguished the great mass of the aboriginal inhabitants in the north of India, yet some of the earlier inhabitants of India, who were considered by the brahmins as impure and unworthy to partake of their religious sacrifices, found a refuge in the thick forests of the mountain districts, and in the countries south of the Vindhya range, while it is not unlikely that some of them were tolerated by the brahmins, so as to remain in a state of slavery, constituting the class of Sudras, to whom though they were not considered as twice-born, like the three other classes, some few civil rights were conceded, and to whom in latter days even a brahminical origin was attributed. Geologically, few parts of India have excited more interest and attention than the districts adjoining the Nerbudda river, the great thickness of sandstones and associated beds, which form the mass of the Vindhya range, being the most striking and remarkable feature in that country. There is a great faulting, accompanied by much disturbance mechanically, and by much alteration chemically (more especially to the south of this fault,) in the rocks which pass along the main line of the Nerbudda valley, along the continuation eastward of this line down the valley of the Soane, and thence across Behar, where the continuation of the same rocks form the Kurruckpoor hills. It is considered a high probability that this line of dislocation was continued to the east by north, up or towards the valley of Assam ; its main direction being E. 15° to 18° N., corresponding with the main direction of the Vindhya range and the Khasia hill range. South of this dislocation the great group of sandstones, shales, &c., forming the Vindhya hills, is almost entirely absent, unless the highly metamorphosed rocks there seen be the continuation downwards of the same series greatly altered. This great group is altogether of a different character and of a more ancient epoch than the beds associated with the coals of Bengal and of Central India,—the latter resting quite unconformably on the former. Mr. Oldham gave the name Vindhyan to this great group, being best seen in the well exposed scarps of the Vindhyan range ; and to the subdivisions in ascending order, the names Kymore, Rewah and Bundair : but he applied these names only provisionally, as he thought it possible that the Rewah limestone and Bundair sandstone are only repetitions of the Soane valley limestone and sandstone produced by faulting. Resting unconformably upon the Vindhya formation, there is a considerable thickness of sandstones, shales and coals, in Central India much disturbed and traversed by trap dykes. The total thickness of this group in this district exceeds some thousand feet. In these beds occur numerous fossil plants, which thoroughly identify these rocks with the coal-groups of Burdwan, of Hazareebaugh and of Cuttack. Taking it as proved that the strata at Kotah, from which the fish and Saurian remains had been obtained, are the same with those of Kamptee near Nagpore, the strong Permian analogies of the Saurians (Brachyops) ought not to be overlooked. The Vindhya mountains form the southern limit of Hindostan, but, beyond them, separated by the deep valley of the Nerbudda, is a parallel chain called Injadri or Satpura, which must be crossed before we reach the next natural division in the valley of the Tapti. This small tract is low, but the rest of the Dekhan is almost entirely occupied by a table land of triangular form about the level of that of Central India.

The Vindyan languages, and particularly the Gond, have a closer agreement with the Karnataka and Tuluva, and even with the Kodagu and Todava, than with the adjacent Telugu. This is seen in the forms of many common Dravidian roots and particles. Gondi has also some special affinities with ancient Tamil. It is probable that the Telugu and Marathi have spread inland from the east and west into the upper basin of the Godavery, and thus cut off the ancient connection between the Gondi and the Karnataka and the Malayalam, which prevails throughout the rest of the belt to Cape Comorin. The main portion of the south Dravidian land is occupied by three populous nations speaking as many dialects.—*William's Story of Nala, p.* 220. *The British World in the East, Ritchie, vol.* i. *p.* 6. *Hind. Vinegar is an impure acetic acid, of which several varieties are known in commerce, such as wine, malt, sugar, toddy, &c. vinegar. It is extensively employed for pickling, in domestic cookery, &c. Acetic acid is the volatile principle, to the presence of which, diluted with variable proportions of water, vinegar owes its aroma and pungency. This acid exists, ready formed, in notable quantity in certain plants, as Sambucus niger or Black elder, Phœnix dactylifera or Date tree, and Rhus typhenus. It may be readily generated by the fermentation of various vegetable and animal substances, especially the former. For commercial purposes it is made from certain vegetable and spirituous infusions, as those of the grape, malt, and the sugar-cane; but any vegetable infusion capable of yielding alcohol will also, when exposed to the necessary conditions, furnish vinegar. In most cases, and indeed whenever vinegar is manufactured on a large scale, and the vinous or alcoholic fermentation precedes the acetous, the vinegar is formed entirely at the expense of the alcohol. In India vinegar is obtained from the Dolichos uniflorus, but is also made from the sediment of palm wine or toddy, and is coloured artificially. The juice of the Gomuti palm, Arenga saccharifera, put into a jar for five days, is converted into excellent vinegar, equal in strength to that produced by the vinous fermentation of Europe. Large quantities of the palmyra toddy are converted into vinegar in Ceylon, and used for pickling gherkins, limes, the undeveloped leaves of the cocoa-nut and palmyra trees, and other substances. It is also prepared from the toddy of the cocoa-nut palm. The toddy is collected in fine weather, put into jars, and kept covered for a month; it is then strained and replaced in the same jars, with the addition of a little Chili pepper (Capsicum frutescens) commonly called Bird pepper; a small piece of ghorkah, fruit of the Gamboge tree, the red sort of which is to be preferred, being most acid, and the pod of the Hyperanthera moringa. At the expiration of five weeks or a month, it becomes very excellent vinegar. The vinegar obtained from sugar-cane juice is generally a poor stuff, and does not contain more than two per cent. of acetic acid, but at some places it is made well, especially at Delhi, and really excellent at Peshawar, made from grapes; quite fit for table use. Acetic acid can be distilled from vinegar, but the common country vinegar of the bazar generally contains only a very small portion of acetic acid, often not more than 2 per cent. If ten measures be taken of vinegar, it should be distilled till nine have passed over.—*Powell Handbook, v.* 1, *p.* 312; *Faulkner*; *McCulloch Commercial Dictionary*; *Royle Materia Medica*; *O'Shaughnessy*; *Eng. VIOLA, a genus of plants of the natural order Violaceæ. There are almost 19 species known of the genus Viola. The roots of most of the violet tribe have an acrid nauseous taste, and have emetic properties, and in Europe V. arvensis, canina, odorata, and tricolor are so used. The "Akukira" and Banafsha plants of Kaghan are species of Viola ; V. distans and V. serp[illegible]s are of the Khassya, V. glaucescens is of the peninsula, V. odorata is of Europe, Siberia, and China, V. patrinii is of Siberia and the Neilgherries, V. roxburghiana is of Bengal, and V. Wightiana is of the Peninsula. Viola hirta, lactea, and lutea, are other species. V. cinerea, *Boiss*, grows in the plains, Trans-Indus, and in the Salt Range, and several species are found in the Himalaya up to 10,000 feet, perhaps the commonest being V. serpens, *Wall.* The plant of this and other species is found in the bazar, and considered diaphoretic and aperient. Viola patrinii is found in Hazara. A dark flowered variety has a particularly fine scent.

VIOLA ODORATA. *W.*

Behussej.	ARAB.	Sweet Violet.	ENG.
March Violet.	ENG.	Banafsha.	HIND. PERS.

This plant in the dry state is sold in all Indian bazars, and is prescribed in infusion by the hakims as a diaphoretic in the treatment of fever. It nauseates slightly, owing to its containing a very minute quantity of the principle termed violina, closely resembling the emetine on which depend the virtues of the ipecacuanha of Brazil. The Viola odorata, as sold in the bazar, has dry, thready, fibrous roots, a pale yellow colour, knotty, some as thick as a quill. The leaves are heart-shaped ; flowers blue. The entire plant retains slightly the delightfully sweet smell characteristic of this tribe. Under the name of Bekh-banafsha, or violet root, and having precisely the smell of the fresh flower of V. odorata, the well known "orris root" or Iris florentiana is also sold in the bazar. Excellent issue peas are made from this root. The root of this violet separated from the plant and reduced to powder, proves emetic in doses of from two to four drachms made into a decoction by boiling water. The emetic operation is preceded by much nausea, and is often followed by purging. Dr. O'Shaughnessy preferred as an emetic the Crinum toxicarium. Several species of violet possess similar properties.* Royle has figured three Himalayan species, V. serpens, V. reniformis, and V. kunawurensis, the first of which is found in Mussooree, the second on the Choor mountain, the last in Kunawur. The sweet scented violet requires a good rich soil, shelter from the sun and plenty of water. They are best grown in pots, require to be moderately shaded, the morning sun being sufficient for them : must be protected from the hot winds, and divided out into small bunches when transplanted. The white violet is not known in the southern part of India, but in England the finest are generally found in calcareous soils ; in India the violet seldom blossoms if grown in garden beds.—*Riddell. O'Shaughnessy page* 208. *Jaffrey.*

VIOLA SUFFRUTICOSA. syn. of Ionidium suffruticosum, *Ging.*

VIOLA TRICOLOR. Heartsease or Pansy, flowers vary much in size ; some only are odorous. The colours are, as its name indicates, mixed and numerous, being from deep purple and yellow to blue and white, crimson, &c. In Europe this flower has been brought to great perfection from the mode of continual offsets. The flowers are not generally scented, but some are found so on the Neilgherry hills. The seed should be taken as soon as the seed vessels appear round and full ; they may be dried in the house and the seeds preserved; if left on the plant the capsules dry and open of themselves, fresh plants springing up from the seed that drops out. Requires a light loamy vegetable soil.—*Riddell.*

VIOLACEÆ, *Lindley*, the Violet tribe of plants, of 3 genera, 9 species, viz. 6 Viola ; 1 Ionidium ; 2 Alsodeia. *Sub Order* Sauvagesieæ, *Lindl.*

VIR or Bir. Sansc. man, the Latin Vir. Birbani, the term amongst the Jat for a man's own wife. A femme couverte.

VIRA. See Hindu.

VIRABHADRA, or Ehra badra, amongst the hindoos, a terrible being, created by Siva for the purpose of destroying the sacrifice of Daksha. His image stands in the temples of the Grama-devata, is by some called an *avatar*. As son of Siva, he is fabled to have been produced from the *jatra*, or plaited locks of that deity, which he cut off and threw on the ground in a moment of frenzy, on learning the death of Suti, caused by the curse of Daksha. Vira Bhadra immediately attacked Daksha and cut off his head, which fell into the fire prepared for a sacrifice and was burnt. He is represented armed with various instruments of destruction; and the representations of him are usually seen with the head of a goat (with which that of Daksha was replaced on his body) near them, or accompanied by a human figure with a goat's head.—*Cole. Myth. Hind. p*. 74. See Daksha, Parvati.

VIRADHA GUPTA. See Kabul.

VIRAKTA, a class of the Dadhu Panthi sect of hindoos. They go bare-headed and have but one garment and one water pot.

VIRA BUKKA RAYA. See Sayana Acharya.

VIRA DAMA. See Inscriptions, Junagurh.

VIRAGI, a hindoo religious devotee, who takes the name from the Sanscrit words "vi" privative, and "rag" desire.

VIRAGI NAGA. See Naga.

VIRAGU. Tam. Harmala ruta.

VIRAJ. The primeval being, represented under a form half male, half female. The term is sometimes applied to Siva and Parvati; but where gods meet gods at every step, it is impossible to decide which of them was the primeval being. Mr. Colebrooke informs us that the primeval being felt no delight, therefore man delights not when alone. He wished the existence of another, and instantly became such as is man and woman in mutual embrace. He caused this, his own self, to fall in twain, and thus became a husband and wife; therefore was this body, so separated, an imperfect moiety of himself. This blank, therefore, is completed by woman: he approached her, and thus were human beings produced, &c., &c.—*Cole. Myth. Hind. p*. 100. See Brahmadica, Saraswati.

VIRAJAJI ?—Jasminum, *sp*. Double jasmine.

VIRAKTA. See Viragi, Dadhu Panthi.

VIRAMPILA. Tam. Malayal. The Jackwood tree, Artocarpus integrifolia, of great value in consequence of its fruit. In Ceylon it supports the pepper-vine. In many places it is found two feet and a half in diameter, and from thirty to thirty-five feet high. In Canara this wood was preferred by Tipu sultan for the Grab vessels built at Honore, his naval depot. In Ceylon, at Point de Galle, it is used by furniture-makers for chairs, couches, &c., for which purpose it answers well, and, if polished with care, its brilliant colour is superior to that of mahogany. When worked and cut down it is yellow, but turns dark and improves by age.—*Edye, M. & C.*

VIRANANG. Sans. Andropogon muricatus, *Retz.*

VIRA-SAIVA, a sect of hindoo worshippers of the god Siva. They are divided into two sects: one semi-brahminical or high church, called A'ra'dhya; the other is anti-brahminical, and is called Jangam. The A'ra'dhya claim to be descendants of saivite brahmins, and between them and the Smarta brahmans there is a certain degree of reluctant intercourse founded upon the rites of initiation (upanayanam) which both parties use.—*Brown's Essay on the Creed, Customs, and Literature of the gams, p*. 2.

VIRA SENAKA. See Inscriptions, Junir, Karli.

VIRATARA, also Viratarang. Sans. Cuscus root, Andropogon muricatus, *Retz.*

VIRAVARMA. See Inscriptions.

VIRDATI. See Timor Laut.

VIREY. Tam. A Ceylon tree which grows to about twenty inches in diameter and twelve feet high. It has a very handsome, hard wood, and produces a mealy seed, which the poorer natives eat as a substitute for rice.—*Edye Ceylon.*

VIRIGE CHETTU. Tel. Cordia sebestena, *Linn.*

VIRIKA, amongst the Canarese race of Mysore and in the Southern Mahratta country, the ghost or evil spirit of unmarried or unchaste persons, or of those who have met a violent death. They are appeased by offerings.

VIRK. See Jat, Jet, Jut.

VIRTRIUOLO BLO. It. Blue stone.

VIRUGADU, or Irugudu. Tel. Dalbergia latifolia, *Roxb.*

VIRUM, also Vachira kallu. Tam. Diamond.

VIS, or Viss, or Pusseree, an Indian weight. The Burmese viss or picktha is 140 tolas, 100 ticals, 40 pollams or 3 catties, = 3lbs. 2oz.; 8 viss, therefore, make a maund of 25 lbs. The viss, however, varies in different localities: in Trichinopoly, it is 3 lbs.; in Masulipatam, 3·515 lbs.; in some other places it is much more. Visary is a name in the Madras presidency for the vis.—*Simmond's Dict.*

VISAGUL. Sing. Bezoar.

VISAKHADATTA. See Kabul.

VISALA. See Surya-vansa, Topes.

VISCUM ALBUM. *L.*

Mistletoe,	Eng.	Jang,	Kaghan.
Banda,	Hind.	Ahalu,	,,
Bhangra,	,,	Kakbang of	Sutlej.
Bambal,	Kaghan.	Ringi of	,,
Wahal,	,,	Turapani of	Tr. Indus.

This parasite occurs in many places at from 3,500 to 9,000 feet in the Punjab Himalaya up to the Indus, and in the Suliman Range. The plant is of popular interest as having been connected with Druidical superstitions. But the mistletoe of the Druids was exclusively that found upon the oak, and was, possibly, so much valued because of its rarity, for its appearance on that tree is now so rare that many persons have believed the mistletoe of the Druids either to have been some other plant, or to have had no real existence. Honigberger states that it is given in enlargement of the spleen, in cases of wound, tumour, diseases of the ear, &c. The fruit is covered with a viscid pulp, and is made by the Italians, and in Herefordshire, into a kind of bird lime; and as it is a favourite food of the large or Missel Thrush, it is thought to have given rise to the proverb, 'Turdus malum sibi cacat.' The seeds in germination seem to offer an exception to a general law that the radicle of the embryo shoots downwards, and the plumule upwards; for the radicle of mistletoe invariably turns itself down upon the body to which it is attached, whatever may be the position of the surface of that body with respect to the earth. For instance, if a cannon ball, to which mistletoe seeds are glued on all sides, be suspended by a cord some distance from the earth, both the upper and under seeds, as well as those at the sides, all direct their radicle to the surface of the ball. This property ensures their growing upon the branches of trees, to whatever side they may happen to stick. In fixing itself upon a branch, the embryo of the mistletoe curves its radicle down upon the bark, and then adheres firmly to it, and it is a twelvemonth before the plumule begins to extend; this may be to give the radicle time to pierce the bark and introduce itself below the liber, where it expands and acts the part of a root, by attracting thence the fluids which are necessary for the support of the parasite. It is not a little remarkable that in the structure of its ovary, this plant and others of its order, should offer the singular fact of the ovule not existing at the time of impregnation, nor appearing till from six weeks to two months later. Dr. Wight gives Viscum coralloides, moniliforme, orbiculatum, ramosissimum.—*Drs. Wight. Ic. J. L. Stewart. Eng. Cyc.*

VISCUM MONOICUM.

Kuchila ke mulung. Hind.

It was accidently discovered in 1836 that the Viscum found on the Nux vomica trees of Cuttack possessed all the properties of the supporting tree. In 1837 Lieut. Kittoe, then at Cuttack, received information of the existence of a parasite on the Nux vomica trees which the natives held to be an extremely powerful narcotic and poisonous in small doses, and they used it in the treatment of agues and rheumatism. Mr. Kittoe having procured specimens of the leaves, sent them to Dr. O'Shaughnessy for experiment. Given in three grain doses to dogs and kids, tetanic spasms set in in the course of from five minutes to a quarter of an hour, recurring at intervals, and proving fatal by fixing the diaphragm and causing asphyxia.—*O'Sh. p.* 375.

VISENIA VELUTINA. *W. Ic.*

Riedelia velutina, *DC.*
Glossospermum velutinum, *Wall.*
Visenia umbellata, *Blain. W. Ic.*

A considerable tree of Sumatra, Java and Mauritius, of great beauty, with rose coloured flowers and velvety leaves. It was introduced from Sumatra into the Calcutta Garden by Dr. Wallich.—*Voigt, Dr. Cleghorn in M. E. J. R.*

VISERWA. The name of a usurper with whom commenced a line of fourteen princes, who held the sceptre for about 500 years, and the last of whom was deposed in a manner analogous to that which had first put the dynasty in possession of the throne.—*Trav. of a Hindoo.*

VISH. Hind. Ativasa, Tel. Aconitum ferox, *Wall. Cat.*, also any poison, and variously pronounced bis, bish. The Sanscrit syn. Ati visha, is from ati "very," and visha "poison." Wallich applies the term to a species of Betula which he states to be an antidote to poison, and in like manner the word nirvisha "an antidote," has been given to some kinds of aconite. But the Telugu word is always understood as designating an active poison, which is the character of the vish, bish, or bikh of upper India.—*Royle. Roxb.* iii. 57. *O'Shaughnessy,* 155, 168. *Elliot.*

VISHA. The poison ordeal. If the accused person swallow it with impunity he is innocent. Another ordeal is the kusha, or drinking of holy water.

VISHA-AL. Maleal. Embelia ribes, *Burm. Roxb.*

VISHABUDDI. Tel.

Sida acuta, Burm. | Sida lanceolata.

Boddi is a name of Rivea, Visha is poison, referring apparently to a poisonous Convolvulaceous plant. Brown refers to a Menispermaceous plant, Anamirta? sent from Guntur to the Exhibition of 1859.

VISHAKALLU, and Pamu Kallu, also Telukallu. Tam. Bezoar. The terms mean respectively poison stone, snake stone, and scorpion stone.

VISHA KANDRIKELU. Tel. Kandrika means "a lot of land or portion of a village granted free of rent."—*Br.* 159.

VISHAL. Tam. Embelia ribes, *Burm.*

VISHALA, also Indravaruni. Sans. Cucumis colocynthis. Colocynth.

VISHAMA KONDANARU. Tel. Sanseviera Roxburghii, *Schult.*

VISHAMANDALA. Sans. Visha mungali, also Visha neduraku. Tel. Visha munghe. Tam. Crinum asiaticum, *Willde. Herb.*

VISHA POGALU. Tel. Poisonous vapours.

VISHNU is the second person in the triad or trimurti of hindu deities, and is worshipped as the supreme being by about sixty millions of the people of India. He is a personification of the preserving power, and his sectarian worshippers, called vaishnava, are more numerous than all the others. He has on nine occasions assumed human and other shapes (styled avatar), and has yet to appear in his last shape, that of a white horse. Of his avatar in human shape may be named Rama, Krishna, Buddha, and Kalki. Vishnu is also called Hari, and it is under this name that his votaries call together the brahminy kites, Haliætus pondicerianus, to feed them with portions of animal food. Vishnu is a personification of the sun, or conversely the sun is a type of him ; this character, as well as that of time, he shares with Brahma and Siva. In hindu mythology everything is, indeed, the sun : but Vishnu is sometimes the earth ; he is also water, or the fluid and humid principle generally. Hence he is air, he is also space, and his colour is blue, its apparent tint. In pictures, Vishnu's ethereal character is indicated by mounting him, as his vahan, on a garuda composed of the eagle and the man. Images and pictures of Vishnu either represent him in his own person, or in that of any of his avatara or incarnations, and these pictures may generally be distinguished from those of other deities by a shell chank and a wheel or disc, called a chakra. When whirled by Vishnu, the chakra has a sharp edge, and irresistible fire flames from its periphery. Two other attributes appertain generally to Vishnu : these are the gadha, a mace or club, and the padma, or lotus, though these last are oftener seen in the hand of his avatara than in those of Vishnu himself. Vishnu, regarded as time, corresponds with the Florus of Egypt. The legends of his sleeping, awaking, and turning on his side, evidently allude to the sun at the solstices ; also to the phenomena of the overflow and receding of the Ganges, so similar to that of the Nile in Egypt. On the 11th day (sometimes on the 14th, which is the day of the full moon,) of the bright half of the lunar month Kartica, Vishnu is fabled to arise from his slumber of four months. A festival is held in honour of this day, and at an auspicious moment, astrologically determined, Vishnu is awakened by this incantation or mantra : "The clouds are dispersed, the full moon will appear in perfect brightness, and I come in hope of acquiring purity to offer thee fresh flowers of the season ; awake from thy long slumber, awake ! Lord of worlds." During his four months' repose, and when it is just half over, Vishnu is supposed to turn himself on his side on the 11th of the bright half of the month Bhadra. This is a coincidence with the allegories of the Egyptian Horus. Vishnu is the second-named of the trimurti or hindu triad, and the preserving spirit of the supreme deity Brahm. This god is represented of a black or blue colour, with four arms, in which he holds a club, to show that he punishes the wicked ; the chank, or wreathed shell, blown on days of rejoicing, and at periods of worship ; the chakra or discus, the emblem of his universal domination ; and the lotus, or water-lily, the type of his creative power. He is variously described : sometimes seated on a throne of the sacred lotus, with his favourite wife, Lakshmi, in his arms, or standing on a lotus pedestal between his two wives, Lakshmi and Satyavama ; at others reclining on a leaf of that flower, or on the serpent Ananta, or eternity, floating on the surface of the primeval waters ; or riding on Garuda (his celestial vahan or vehicle), which is represented as a youth with the wings and beak of a bird. No sanguinary sacrifices are offered to Vishnu. He is considered as a household god, and is extensively worshipped. His wives are Lakshmi, the goddess of fortune and beauty, and Satyavama. Of the various incarnations of this deity, one is mentioned in an ancient legend relating to the destruction of the city of Mahabalipooram, or the Seven Pagodas on the coast of Coromandel, by an earthquake and inundation, during an early period of hindu history. It is stated that "Hirinacheren, a gigantic prince or demon, rolled up the earth into a shapeless mass, and carried it down to the abyss, whither Vishnu followed him in the shape of a hog,-killed him with his tusk, and replaced the earth in its original position." A large portion of the magnificent ruins of that city and pagodas are now covered by the sea ; other parts of them (the sculpture of which are still in many places very little injured by the lapse of ages or the effect of the elements,) extend over a space of several miles. One of the cavern temples, now used as a place of worship, is said to contain a fine figure of Vishnu in the Varaha avatar. In this avatar Vishnu appears in the person of a courageous and virtuous prince, the son of the puissant sovereign of Hindustan (whose capital, Ayodhya, is said to have extended over a space of forty miles,) to punish a monstrous giant, Ravana, who then reigned over Lanka or the island of Ceylon. Ravana, like the tyrants of the preceding avatars, according to one version, had obtained his power by his piety. Acording to another, the mode of Ravana's acquirement of power exonerates Brahma and implicates Siva in a manner difficult to account for beyond the charmed pale of hindu mythology. Ravana, to propitiate Siva, cut off nine of his ten heads, and was about to decapitate the tenth, when Siva (Mahadeo), moved by such extraordinary devotion, demanded to know his wishes, pledging himself unreservedly to grant them. Ravana demanded immortality, universal dominion, the linga, and Parvati. These were, in consequence of Siva's pledge, bestowed: but as that god happened to be seized with a momentary uxorious fit, he was unwilling to part with the lovely source of all his torment and all his bliss; so he prevailed on Vishnu to obtain (which that deity had a happy facility in doing) by stratagem, what he himself could not withhold. Vishnu, in disguise, succeeded; and Parvati, after purifying herself by austerities, was restored to her proper lord. Dominion and immortality, it would appear, still remained with Ravana, as, according to descriptions of compartments said to be in the temples of Ellora, he made prisoners of all the gods, not excepting Brahma, Vishnu, and Siva, and put them in chains. The other version is that Brahma, in consequence of Ravana's piety, rewarded him with the monarchy of three regions. Rama Chandra had also been brought up in the paths of religion and virtue, and had been taught that one of the first duties of a prince was to subjugate his own passions to their control. When, therefore, Ravana became an apostate from his duty to the gods, Ramachandra was appointed the instrument of his destruction. The Grecians had their Homer to render imperishable the fame acquired by their glorious combats in the Trojan war; the Latins had Virgil to sing the prowess of Æneas, and the Hindus have had their Valmiki to immortalize the martial deeds of Rama, and his army of monkeys, in subduing the giant Ravana and his hosts of many-headed monsters. The Ramayana, one of the finest epic poems (in spite of its many extravagances) extant, beautifully describes the incidents of Rama's life, and the exploits of the contending foes. The deity whose fame is thus celebrated, is, in the pictorial representations of him, usually described as a green man, seated beneath an umbrella, the emblem of sovereignty, on a throne: a quiver of arrows hangs at his back; in one hand he holds his destructive bow, and in the other a flower of the sacred lotus. By his side is placed Sita, who is depicted as a goddess of transcendent beauty, of a deep yellow complexion. The incarnate deity, whose exploits are recorded by the poet Valmiki, is considered by Sir William Jones to be the same as the Dionysos or Bacchus of the Greeks. This Dionysos or Bacchus, whom he imagined to be Rama, the son of Cush, is fabled to have invaded India and other countries with an army of satyrs, commanded by the sylvan deity Pan; and Sir William Jones concludes that this army, or probably part of it which he thinks may have been composed of hardy mountaineers, gave rise to the poetical tale of the feats of Rama aided by the heroic Hanuman and his host of monkeys. We shall, however, obtain a more consistent, as well as a better understood comprehension of Rama, in considering him to have been the son of Desaratha, of the solar race, king of Ayodhya, now termed Oudh, a potent sovereign of Hindustan who, having been banished by his father in consequence of the machinations of his queens, retired to the banks of the Godavery, accompanied by his brother Lakshmana, and his wife Sita, and lived in the neighbouring forests the austere and secluded life of an ascetic. But Sita having been forcibly taken from him by Ravana, the king of Lanka (Ceylon), Rama, with the aid of Sugriva, the sovereign of Karnata, invaded the kingdom of Ravana, and having conquered him, placed his brother on the throne of Lanka in his stead. The Godavery is a sacred stream, and its banks appear to be classic ground, where the visitor is almost at every step reminded of the heroes of the Ramayana. Here are the temples of Rama and Hanuman, the caves of Nasuk (nose) which commemorate the ungallant action of Lakshman in cutting off the nose of Surpanukha, and the cave of Sita, round which Lakshman drew the circle with his bow, which in his absence she was not to overstep. Like the misguided bride of Blue-beard, however, she did so; and the war of Lanka and the Ramayana were the consequences. Rama is extensively worshipped, and numerous temples are erected to him, among which is the splendid one at Ramnaghur. The second of Vishnu's ten grand avatars, or incarnations, was in the form of a tortoise, and hence called the Kurma avatara, the principal incident in which was churning the ocean with the mountain Mandara, the huge serpent Sesha serving as a rope to whirl the mountain round withal, and Vishnu, in the shape of a tortoise, sustained the vast load. The result was fourteen precious articles, called gems, or chaoda ratni, (more classically Chatur desa ratna), and one of the fourteen was poison; but,

> "To soften human ills, dread Siva drank
> The poisonous flood that stain'd his azure neck."

It might perhaps have been more in character, if the preserving power had averted from mankind the calamities incident to the production of this "poisonous flood," but the legend, which is very popular, gives the action to Siva or Mahadeva, whence the epithet Nilakantha or blue throated, is a name of Siva. With the saiva sect it is now not an uncommon name of men, usually pronounced, as is that of the deity, Nilkant. It is related in the Scanda Purana, that, when the whole earth was covered with water and Vishnu lay asleep on the bosom of Devi, a lotus arose from his navel, and its ascending flower soon reached the surface of the flood; that Brahma sprang from the flower, and looking around without seeing any creature on the boundless expanse, he imagined himself the first born. Vishnu, otherwise called in this character, Narayana, with his toe in his mouth, reposes on a floating lotus leaf. This may perhaps represent a circle, and like the tail of a snake in its mouth, in mythological language, is interpreted endless: applied to time, eternity: to being, eternal.

The sects of the hindoos merge into each other; for, in consequence of the interposition of Vishnu to appease a physiological difference between Mahadeva and Parvati, or the worshippers of the Linga and Yoni, his (Vishnu's) navel, says Major Moor, came to be considered as the same with the Yoni, thus confounding the yonija with the vaishnava. The vaishnava sect of the present day, though nominally worshippers of Vishnu, are, in fact, votaries of deified heroes. The Goculast'ha (one branch of this sect) adore Krishna, while the Ramanuj worship Ramachandra. Both have again branched into three sects; one of whom, the exclusive worshippers of Krishna, are deemed the only true and orthodox vaishnava; another joins his favorite Radha with the hero; a third, called radha-villabhi, adores Radha only, considering her as the active power of Vishnu. The followers of these last mentioned sects have adopted the singular practice of presenting to their own wives the oblations intended for the goddess; and those among them who follow the left-handed path are said to require their wives to be naked when attending them at their devotions. Among the Ramanuj some worship Rama only, and others both Rama and Sita; none of them practice any indecent mode of worship, and they all, like the goculast'ha, as well as the followers of the bhagavata, delineate on their fore-heads a double upright line with chalk, or with sandal-wood, and a red circlet with red sanders wood, or with turmeric and lime; but the Ramanuj add an upright red line in the middle of the double white one. The saiva sect are all worshippers of Siva and Bhavani conjointly; and they adore the linga, or compound type of this god and goddess, as the vaishnava do the image of Lakshmi-Narayana. There are no exclusive worshippers of Siva besides the sect of naked gymnosophists, called Lingi; and the exclusive adorers of the goddess are the sacta sect. Major Moor mentions that the indecent worship of this sect is most grossly so, and consists of unbridled debauchery with wine and women; they are held in deserved detestation; and even the decent sacta followers do not make public profession of their tenets, nor wear on their foreheads the marks of their sect, lest they should be suspected of belonging to the other branch of it. The saiva and sacta delineate on their foreheads three horizontal lines with ashes obtained, if possible, from the hearth on which a consecrated fire has been maintained; they add a red circlet, which the saiva make of red sanders, and which the sacta, when they avow themselves, mark either with saffron or with turmeric and borax. The Saura or Suria are true worshippers of the sun; and some of them adore the dormant and active energies of the planet conjointly. This sect, which is not very numerous, is distinguished by the use of red sanders for the horizontal triple line, as well as for the circlet on their foreheads. The left-handed path, or indecent mode of worship, of the several sects, especially that of the sacta sect, is founded on the Tantra, which are, for this reason, held in disesteem. The worshippers of Vishnu, Siva and the Sakti, are not to be confounded with the orthodox adorers of those divinities; few brahmins of learning, if they have any religion at all, will acknowledge themselves to belong to any of the popular divisions of the hindu faith, although, as a matter of simple preference, they more especially worship some individual deity as their chosen or Ishta Devata. They refer also to the Vedas, the books of law, the Puranas, and Tantras, as the only ritual which they recognise, and regard all practices not derived from those sources as irregular and profane. Vishnu, and all other of the hindoo deities, have their different avatars or incarnations, in all of which, except that of the Sacti themselves, they have their sacti (wives) or energies of their attributes. These have again ramified into numerous names and forms. The great point of difference amongst the sectaries is as to the claims of respective deities to be regarded as the First Cause. Some assert that as Vishnu (the preserving spirit of God) was sleeping on the serpent Ananta, or eternity, on the face of the waters, after the annihilation of a former world, a lotus sprung from his navel. From this issued Brahma, who produced the elements, formed the present world, and gave birth to the god Rudra (or Siva) the destroyer. He then produced the human race. From his head he formed the brahmins or priests; from his arms, the khetri or warriors; from his thighs the vaisya or merchants; and from his feet the sudra or husbandmen. If inquiry be made of a vaishnava, or one of the exclusive adorers of Vishnu, he will not fail of exalting the object of his own adoration to the throne of the one only almighty being; and with that view will call him Narayana, although, in fact, the name is not strictly applicable to that being, but to his spirit, if such a personification can be conceived. The Goculast'ha, a branch of the vaishnava, will similarly exalt Krishna, the exclusive object of their adoration; and in other personages we are scarcely able to distinguish the persons of Narayana and Brahma. On the other hand, many of the hindu sects seem to have originated, in a great measure, out of opposition to the brahminical order; teachers and disciples are chosen from any class, and the distinction of castes is, in a great measure, sunk in the new one of similarity of schism. The ascetics and mendicants, also, in many instances, affect to treat the brahmins with particular contempt, and this is generally repaid with interest by the brahmins. A portion, though not a large one, of the populace, is still attached to the Smarta brahmins as their spiritual guides, and so far are distinct from any of the sects; whilst most of the followers even of the sects pay the ordinary deference to the brahminical order, and especially evince towards the brahmins of their own fellowship, of whom there is generally an abundance, the devotedness and submission which the original hindu code so perpetually inculcates. Excluding those hindus who may be regarded as the regular worshippers of recognised gods, the following is an enumeration of the several sectaries of each class, and to them we refer for notices of their origin and tenets.

Vaishnava sects.

1. Ramanuja or Sri Sampradaya, or Sri Vaishnava.
2. Ramanandi or Ramawat.
3. Kabir Panthi.
4. Khaki.
5. Maluk Dasi.
6. Dadhu Panthi.
7. Raya Dasi.
8. Senai.
9. Vallabha Chari or Rudra Sampradayi.
10. Mira Bai.
11. Madhawa Chari or Brahma Sampradayi.
12. Nimawat or Sanakadi Sampradayi.
13. Vaishnava of Bengal.
14. Radha Vallabhi.
15. Sak'hi Bhava.
16. Charan Dasi.
17. Harischandi.
18. Sadhua Panthi.
19. Madhavi.
20. Sanayasi, Vairagi and Naga.

Saiva sects.

1. Dandi and Dasnami.
2. Jogi.
3. Jungama.
4. Paramahansa.
5. Urdhaba'hu, Akas-Muk'hi and Nak'hi.
6. Gudara.
7. Ruk'hara, Suk'hara and Uk'hara.
8. Kara Lingi.
9. Sanyasi.

Sakta sects.

1. Dakshini.
2. Vami.
3. Kanchebiya.
4. Kararia.

Miscellaneous sects.

1. Ganupatya.
2. Samapatya.
3. Nanik Shahi, of seven classes, viz.
    - *a.* Udasi.
    - *b.* Ganjbakhshi.
    - *c.* Ramrayi.
    - *d.* Suthra Shahi.
    - *e.* Govind Sinhi.
    - *f.* Nirmala.
    - *g.* Naga.
4. Jaina, of two principal orders,
    - *a.* Digambara.
    - *b.* Swetambara.
5. Baba Lali.
6. Pran Nathi.
7. Sadh.
8. Satnami.
9. Siva Narayini.
10. Sunyabadi.

Amongst other sectarians, we have—

Aghori.
Avadhuta.
Gudara.
Kanchelia.
Bhakta.
Saurapata or Saura.
Brahmachari.
Kerari.

The following are towns with celebrated vaishnava temples :—

Tirupathy (N. Arcot.) Vencata Ramah.
Conjeveram (Chingleput.) Vurda Raja.
Triplicane (Madras.) Parthasardy.
Seringham (Trichy.) Runga Naika.
Seringapatam (Mysore.) do.
Sevasumoodrum (Mysore.) do.
Malcotta (Mysore.) Chellapilla Roya.
Theroonarrayanapoorum (Mysore.) Yôga Narasimha
Nursepoorum (Mysore.) Narasimha.
Near Guntoor, Panaka Narasimha.
Bilegory Rungan Hill (Mysore.) Bilegori Runga.
Mondepollum (Coimbatore.) Vencata Rama.
Sutheagal (do.) Gunee Ramasawmy
Streeparamathoor (Chingleput.) Odayavur.
Tinanore (do) Baktha Vatchalasawmy.
Teroovellore (do) Veeraragavu.
Chicacole (Ganjam.) Chicacolusawmy.
Buthrachella (Ceded dists.) Rama.
Teroopagoodul (Chingleput.)
Caroor (Coimbatore.) Thauthony Vencataramen.
Uduppy (S. Canara) Krishna.
Ulamaloo Mungapoorum (N. Arcot.) Ulamaloomunga.

Other localities famed for incarnations of Vishnu are—

Kovilady.
Algherry.
Strevullyputtoor.
Strivycoontum.
Auuntasainum.
Triputor.
Janarthanum.
Ghuteka Chellum.
Ahabulum.
Srisailum.
Simhaudry.
Bhudradry.
Pundrapoorum.
Virarymuly.
Thenkasi.
Tirvuttoor.
Tirmamboor.
Mylapoor.
Kristampet.

Ashadi Ekadasi is the eleventh of the light half of the month Ashad, and is dedicated to Vishnu. It falls about the 12th July, and refers to the summer solstice, and, on this feast day, commences the night of the god, during which he reposes for four months on the serpent Sesha. The Battia are a hindu sect who worship Vishnu and his incarnation as Ballaji, at Panderpur and Triputti. They have a great reverence for their guru, whom they style maharaj, and place at his disposal tan, man, dhan, body, mind and means, and recently, in Bombay, scandalous immoralities regarding the carelessness of their women were shown. They are generally merchants. Amongst the vaishnava, the term Bhakta or Bhagat is now usually applied to a puritan, or individual more devout than his neighbours. The Bhakta' formerly were a sect who worshipped Vishnu as Vasudeva, and the Bhakta mala is a work in which is embodied the legendary history of all the most celebrated Bhakta or devotees of the vaishnava order. It was originally written in a Hindi dialect, by Nabha Ji, about A. D. 1580, but was added to by Narayan Das, who probably wrote in the reign of Shah Jehan. This, termed the *Mala*, was added to in A.D. 1713 by Krishna Das, the additions being named the Tika. The sacrificial offerings to Vishnu are rice, flowers, curds, fruits. To Siva and Durga, the objects offered in sacrifice, are goats, sheep and buffaloes.

The Tulsi plant is typical of a nymph beloved by Vishnu or Krishna. The Chatanula, according to Wilson, are a class of sudra who worship Vishnu exclusively, and whose occupation is the sale of flowers; and this seems to be the race known in the peninsula as the Satani or Satani-wanlu.

The Ananta chaturdasi is a hindu festival in honor of Vishnu.

The Bairagi or Viragi, meaning devoid of passion, are hindu devotees, worshippers of Vishnu. In the south of India Vishnu is considered by the vaishnava to be the supreme being, or the masculine power of the Parabaravastu, and he is one of the mummurthi.

The Bania race largely worship Vishnu, who is adored in some places as "the four-armed," and is placed upon an altar clad in robes of his favourite colour (pandu, or yellow ochre), whence one of his titles, Pandurang. At the intervals of the minor destructions of the world, Vishnu is represented as having reposed himself upon the serpent Sesha, amidst the waters by which the earth is overspread. He also sleeps for four months, from the 11th of Asharh to the 11th of Kartik, or from about the middle of June to the middle of October, or from the time the periodical rains usually commence till their termination. Vykoontha is the seat of Vishnu, the heaven which he quitted to assume the incarnate form of Rama. There sits the preserver of the world, enthroned with his consort Lakshmi, attended by Hanuman, Garuda, and watched by Droove, the north star, the keeper of his royal gate. Nothing has yet turned up to give a clue for ascertaining the age in which vaishnavism first originated. The most authentic fact of its earliest existence on record is furnished by the inscription on the iron pillar at Delhi, stating raja Dhava, who put up that pillar in A. D. 319, to have been a worshipper of Vishnu. The next fact is supplied by Fa Hian, who saw the Vishnupod to have been already established at Gaya in the beginning of the fifth century. Vishnu worship is said to have been instituted at Kanchi in the Carnatic by Luchmana Acharya, but it must have been by a learned brahmin either of Rajpootana or Guzerat, places famous for the life and acts of Krishna, that vaishnavism was modified to introduce the worship of that incarnation. The great text-book of the vishnuvites, Streemut Bhagbut, is supposed to be the work of Bopdeva, a grammarian who lived in the court of the rajah Deoghur in the middle of the twelfth century. In vaishnava hinduism, there are five stages of faith. The first and lowest is simply contemplative, like that of the rishi, Sanaka and Yogendro. The second is servile, like that of men generally. The third is friendly, like the feeling with which Sreedama and the Gopun regarded Krishna. The fourth is maternal, paternal, or filial, like that of Jushoda, Devaki, &c. The fifth and highest is amorous or loving, like that of Radha.

The name of Vishnu is said to occur in several hymns of the veda as an epithet of Indra; the earliest mention of Vishnu, however, now worshipped as Krishna, is on the iron pillar at old Delhi. Gaya is Fa Hian's Kia-ye. It is famous for the hindu vishnupod. The vishnupod, is a rival counterpart of the impression of Buddha's foot, and Gaya and Boodh Gaya, in each other's proximity, point out the alternate predominance of the antagonistic sects. The vishnupod had been set up prior to Fa Hian's visit. Gayalese widowers are barred the privilege of wiving after the death of their first wife, as hindu widows are barred the privilege of taking a husband after the death of their first lord. This savours of the celibacy of the budd'hist priests. The god Vishnu is to the mind of his hindu worshippers the one supreme being who created all things and exists in all things. According to a widely spread belief, Vishnu became incarnate in succession in the two heroes Rama and Krishna, for the purpose of delivering the human race from the oppressions of the Rakshasa, or demons; in other words, to drive out the buddhist hierarchy, and re-establish the brahminical system in India. From some cause or other, the worship of Vishnu declined in Bengal, but it was modified and revived in the fifteenth century by a celebrated religious teacher named Chaitunya. This eminent personage succeeded in reforming many religious and social abuses and founded a sect of all classes without any distinction of caste; and in so doing, continued the great work of Jayadeva, which was commenced about a century previously. The Bania race of Bengal chiefly belong to the sect of Chaitunya, and acknowledge him an incarnation of Krishna, without however adopting any of those ascetic habits which distinguish many of the vaishnava. The lay followers of Chaitunya are merely initiated in the mantra or invocation to the deity by their religious preceptors, who are called Gosains. These gosains are followers of Nityananda, the coadjutor of Chaitunya, and it was to this Nityananda that Chaitunya intrusted the task of spreading his religion after his retirement from his spiritual labours. Up to the beginning of the 19th century, the gosain were held in great veneration, but since then, in Bengal, they receive little respect excepting from hindu females, being regarded amongst the more enlightened hindu community, as the main preservers of superstitious ideas and usages. The gosain are otherwise called guru, and as such are hereditary preceptors in a family. The utmost respect that is paid to the Bengalee gosain by their followers, consists in taking and kissing the dust of their feet, but the younger females are not permitted to appear before them, and no scandals have arisen in the community like those which about the year 1867, obtained such unhappy notoriety in the western presidency. Throughout Bengal, Nuddea is celebrated as the great seat of hindu learning and orthodoxy, the most sacred place of hindu retreat. The Chaitunya Bhagbut states:—'No place on earth is equal to Nuddea, because Chaitunya was there incarnated. No one can tell the wealth of Nuddea. If people read in Nuddea, they find the răs of learning, and the number of students is innumerable.' The brightest epoch in the history of Nuddea, however, dates from the era of Chaitunyá. Regarded by his adversaries as a heresiarch, worshipped by his followers as an incarnation, he is now truly appreciated by the discerning generation of the nineteenth century as a reformer whose efforts produced a little good. The consorts of Vishnu are Lakshmi, Padma or Sri, and those of Siva are Parvati, Bhawani or Durga.—*Wilson's Hindoo Sects*, *Wilson's Glossary*, *Travels of a Hindoo, Coleman, Moor.* See Avatar, Bhavani, Hindoo, Inscriptions, Iswara, Kali, Kama, Kapila, Kedarnath, Krishna, Kurma, Lakshmi, Man-Lion, Maya, Mendicants, Mohini, Nandi, Naneshwar, Narayana, Parvati, Prit'hivi, Rama, Ramanandi, Ramavat, Ramayana, Ravana, Rosaries, Sakta, Salagramma, Sanyasi, Saraswati, Satani, Semiramis, Serpent, Sri Sampradaya, Surya, Takht-i-Suliman, Tripati, Vaishnava, Vamana, Varaha, Veda, Viragi, Vrishala, Yoni.

VISHNU BHAKTA, a worshipper of Vishnu, more especially as Ramachandra or as Krishna.

VISHNU KANTI. Hind. Clitorea ternata.

VISHNU KARANDI. Tam. Vishnu karanta, Tel. Evolvulus alsinoides, *Linn.*

VISHNU-MUNDIRU, is a flat-roofed building having one room with a portico in front, erected either within or without the wall which encloses a hindoo house, or at a little distance from the owner's house.—*Ward's View of the Hindoos, vol.* ii. *p.* 3.

VISHNU PUNYAJANA. See Inscriptions.

VISHNU PURANA. The fourth book of this work contains all that the hindoos possess of their ancient history. It is a tolerably comprehensive list of dynasties and individuals, but is a barren record of events. It can scarcely be doubted, however, but that much of it is a genuine chronicle of persons, if not of occurrences. The Vishnu Purana has kept very clear of particulars from which an approximation to its date may be conjectured. No place is described of which the sacredness has any known limit nor any work cited of probable recent composition. The Veda, the Purana, and other works forming the body of Sanscrit literature are all named; and so is the Mahabarata, to which therefore it is subsequent. Both budd'hists and jains are adverted to. It was, therefore, written before the former had disappeared; but they existed in some parts of India as late as the twelfth century at least, and it is probable that the Purana was compiled before that period. That it is discredited by palpable absurdities in regard to the longevity of the princes of the earlier dynasties must be granted, and the particulars preserved of some of them are trivial and fabulous. Still there is an inartificial simplicity and consistency in the succession of persons, and it is not essential to its credibility or its usefulness that any exact chronological adjustment of its different reigns should be attempted. Deducting however from the larger number of princes a considerable proportion, there is nothing to shock probability in supposing that the hindu dynasties and their ramifications were spread through an interval of about twelve centuries anterior to the war of the Mahabarata, and conjecturing that event to have occurred about fourteen centuries before christianity, the commencement of the regal dynasties of India is thus carried to about 2600 years before that date. After the date of the great war, the Vishnu Purana, in common with those Puranas which contain similar lists, specifies kings and dynasties with greater precision, and offers political and chronological particulars, to which, on the score of probability, there is nothing to object.—*Professor Wilson, pages* 64, 65, 70, *and* 71, *quoted at page* 235 *of Thomas' Prinsep, vol.* ii. See Kasambi, Puranas.

VISHNU-RAT'HA, the car of Vishnu. This is Garuda or Guruda, an eagle, now personified as a winged man.

VISHOLA. Rus. Cucumis colocynthis, *Linn.*

VISHWA-TULASI. Sans. Basella alba, *Linn.*

VISIGOTH. See Hindoo.

VISISHT'HA-DVAITA, a system of philosophy, founded by the vaishnava philosopher Ramanuja. See Sri Sampradaya.

VISLADEVA. See Haravati or Harauti.

VISRAVANA. See Ravana.

VISRI. Tam. a fan.

VISS. A weight of the peninsula of India of lbs. 3 oz. 3. In Burma, the viss is equal to 100 tikal in weight, or 336·6516 lbs. avoirdupois; the Burmese name of the weight is Paiktha.

VISSCHEN. Dut. Fish.

VISSER PALLAM. Tam. Ehretia buxifolia.

VISTARA-KULA-PALLA, or Istarakula palem, Holarrhena antidysentrica, *Wall.* The name is taken from the leaves being employed as trays by hindus to eat from, and which are often made from this tree, but also applied to Holostemma Rheedianum, *Spr.*

VISTNA KLANDI. Maleal. Vistnu Krandi. Tam. Vistnu Krandam. Tel. Evolvulus alsinoides, *Linn.*

VISVA DEVAH. See Hindoo, Saraswati.

VISVA KARMA, the Vulcan of the hindus.

VISVAMITRA. A famous rishi of the hindoos. Viswamitra was born a prince in the Lunar dynasty. According to the Ramayana, he was the fourth from Prajapati, but the Bhagavat makes him the fifteenth from Brahma. They agree in calling him the son of Gadhi, who, according to the first, was the son of Kusanabha, and, according to the second, the son of Kusamba. Viswamitra was sovereign of Kanoj, and engaged in war with the sage Vasist'ha for the possession of Surabai, the all bestowing cow. In this contest, the cow produced all sorts of forces, particularly mlechha, or barbarians, by whose aid Vasisht'ha overcame his adversary. There can be little doubt that this legend is an allegorical account of a real transaction, and that by the cow we are to understand India, or the most valuable portion of it, possibly the valley of the Ganges, for the sovereignty of which either two princes or two tribes, the brahmins and kshetriyas, contended. One of the parties calling to their aid the barbarians, the Persians, and not impossibly the Greeks, triumphed by their means. Viswamitra was born a sage, in consequence of his mother partaking of some charmed food prepared by the muni Richika for his wife, her daughter. After observing the superior might of the brahmins, he engaged in a course of austerities, to rise from the mortal order in which he was born to that of the sacerdotal, and ultimately compelled Brahma to grant him that elevation. To Viswamitra, and his successors, are attributed the ballads in the third book of the Rig Veda. The Viswamitras are known as the Kushika or Kaushika; that is, they came from Kush, to this day the name of a river near the Asia Palus, where M. Ferrier found the ruins of a large place called Kussan. The Kushan, he tells us, were a famous scythian race, who held Balkh in remote antiquity. Sir H. Rawlinson found their bricks, with cuneiform scythic legends at Susa and on the Persian Gulf. Cush is largely used in the local nomenclature of Central Asia. The Caspian Sea, Cashgar, Cashmere, Khas-Sak, (Sacæ or Cossack) Caucas-as (Khas-mountain) Cossæ or Cissii in Persia, the Bal-kash lake and the Kush, are terms, and these are but a mere sample, and it is supposed that the Scythians did not come to the Cushites, but that the Cushites colonized Mongolia, as they colonized Arabia, Ethiopia and the N. coast of the Indian ocean. Indra himself is called a son of Kusika. Fire and Indra worship seem to have been introduced by the Viswamitras and to have supplanted a previous sun worship of earlier immigrants.—*Calcutta Review, Ra-*

mayana, I. Sect. 41-52, *Mahabharat, Adi Parva. Bhagavat,* ix. 15, *&c.* See Brahmadica, Vidya, Hindoo.

VISVARAWA MUNI. See Ravana, Suryavansa, Kuvera.

VISWAKARMA, one of the gods of the hindoos, the architect of the universe, and the fabricator of arms to the gods, is the son of Brahma, and the Vulcan of the hindus. He is also called the Sutar, or carpenter, and presides over the arts, manufactures, &c. In paintings, he is represented as a white man with three eyes, holding a club in his right hand. Some of the most grand and beautiful of the cavern temples at Ellora, Nasik, &c., bear the name of this god. One, at the first mentioned place, is hewn one hundred and thirty feet in depth, out of the solid rock, presenting the appearance of a magnificent vaulted chapel supported by ranges of octangular columns, and adorned by sculptures of beautiful and perfect workmanship. In the sculptured representations of this deity he is shown in a sitting posture, with his legs perpendicular, and holding with the fingers of one hand the fore-finger of the other. Sir W. Jones considers Viswakarma to be the Vulcan of the Greeks and Romans ; being like Vulcan, the forger of arms for the gods, and inventor of the Agnyastra, or fire shaft, in the war between them and the Daitya, or Titans.—*As. Res. vol.* i. 264. See Inscriptions, Vidya, Saraswati.

VISWASEE, or Wisweesa, an Indian long measure, of from 4½ to 5 inches ; also a superficial measure of 20 to 24 square inches.—*Simmond's Dict.*

VISWASAH. See Inscriptions, Junagurh.

VISWA TULASI. SANS. Basella alba, Ocimum album.

VISWAVARNA. See Inscriptions.

VISWESWARA. SANS. Lord of all—an epithet of Siva. See Benares, Kala, Priyanath.

VITA BAJA. See Inscriptions.

VITACEÆ of Lindley's *Nat. Syst,* a natural order of plants, climbing, sarmentose, sometimes simple shrubs, rarely herbs. DeCandolle's Prodromus enumerates, under 5 genera, 102 forms, viz. 32 E. Indian ; 20 S. American ; 11 N. American ; 11 W. Indian ; 4 from Madagascar, Bourbon and Mauritius ; 4 S. African ; 4 from Guinea ; 1 from Zanguebar ; 4 Arabian ; 3 Syrian and Armenian ; 2 Japanese ; 2 from Timor ; 1 from New Holland ; and 3 unknown as to their native place.—*Voigt, p.* 27.

VITASTA. The Jelam or Hydaspes.

VITEX, a genus of plants belonging to the natural order Vitaceæ, the vine tribe. The species known to occur in India are

V. agnuscastus.
V. altissima.
V. alata.
V. arborea.
V. haynga.
V. heterophylla
V. incisa.
V. leucoxylon.
V. negundo.
V. pubescens.
V. saligna.
V. trifolia.

Mr. Rohde says that a species of Vitex, a tree of considerable size, is a native of the forests in the interior parts of Coromandel. Another species of Vitex is a native of Kaghan, where it is called Bankahu. Its wood is used for making large dishes. A third species of Vitex, Kjeyoh, *Burm,* as yet not specifically determined, furnishes one of the woods of British Burmah used for tool handles, and is much prized, but rather scarce; a cubic foot weighs lbs. 45. In a full grown tree on good soil, the average length of the trunk to the first branch is 15 feet, and average girth measured at 6 feet from the ground is 3 feet. The ancients considered the Vitex anti-aphrodisiac, but the berries, from their warm aromatic taste, must be possessed rather of stimulant properties. Vitex Agnus-castus, a native of the south of Europe, is the longest known species, in the month of February, in the tropical region below Darjeeling, it grows in profusion by the road-side and the air is scented with its white blossoms. It has digitate leaves of 5 or 7, nearly entire leaflets, something resembling those of the hemp-plants, and it forms a shrub of about 12 feet in height. The flowers are arranged in spiked whorls. The fruit is globular, rather smaller than black pepper with an acrid and aromatic taste, whence it is called Petit Poivre Sauvage in the south of France. It was well known to the ancients, and forms the Piper agrestis of some authors. The seeds are inodorous when entire, but when bruised their odour is acrid and disagreeable, the taste acrid and pepperish, very persistent. They are very rich in essential oil, and possess powerful stimulating properties. At Smyrna the powder strewed over sliced onion and applied to the stomach is deemed a certain remedy in colic. In India the fruits of the species V. triphylla and V. Negundo, which are indigenous there, have the same properties ascribed to them, and are called Filfil Burree (Large Pepper). There are in the Bombay presidency two species of the genus, V. alata and V. leucoxylon.—*Rohde MSS. Hooker Him. Jour, page.* 374. *O'Shaughnessy page* 485 *quoting Lindley.*

VITEX LITTORALIS, is the Puriri or oak or teak or iron-wood timber tree of New Zealand.

VITEX ALATA. ROXB.

Mel-elow. MALEAL.

A small tree found in the Naggery hills, leaves ternate, petioles winged. It occurs in the Bombay presidency, but is rare. Both it and V. leucoxylon have a white compact wood apparently good for turning, as well as for cabinet work. Its leaves and bark are used in medicine. —*M. E. J. R. Drs. Cleghorn and Gibson.*

VITEX ALTISSIMA. Linn.; *Roxb.*; *W. Ic.*

Tall chaste tree,	Eng.	Mililla gass,	Singh.
Katu mellau mara,	Mal.	Kat miella maram,	Tam.
Meeyan mililla-gass	Sin.		

This tree, in Ceylon, is common in forests, up to an elevation of 3,000 feet. In Coimbatore it is a large tree, of great beauty when in flower, and frequent on the slopes of the western ghats. The timber was reported to Dr. Wight as fit for cabinet purposes. But Dr. Gibson says he is not sure as to the species which Dr. Wight had in his eye when he remarked on this. In Ceylon, this tree produces one of the most valuable timbers in the island for building and other purposes, very hard, fine, close grained and heavy.—*Thw. En. Pl. Zeyl. p.* 144. *Drs. Wight, Cleghorn and Gibson. M. E. J. R. Mr. Mendis.*

A native of the mountainous parts of the Circars, of the forests of the Godavery, at Courtallum, growing in Silhet and Chittagong; very common at Moulmein, and found at Tavoy, Penang and Singapore, flowering in the hot season, and the seed ripens during the rains. In the Circars and Chittagong it grows to be a very large tree, and at Moulmein it furnishes a valuable small timber. Its wood is hard, of a yellowish brown colour, and when old is chocolate coloured, very hard and durable, which renders it useful for various ordinary purposes.—*Voigt. Roxb. Captain Beddome. Root and Leaves. Samalu. | Fruit. Filful bari.

A shrub or small tree common in Ceylon on the banks of rivers up to 3,000 feet, in the peninsula of India, Bengal, the Dehra Dhoon and the Moluccas, common in the Sewalik tract and up to 3,500 feet in the outer hills, and occasional in the Salt Range and out in the plains. The branches are used for wattle-work in Chumba. The leaves are given for colic and used in poultices; and the warm leaves are a useful application in rheumatism or sprains, and the mahomedans are in the habit of smoking the dried leaves in cases of head-ache and catarrh. The root and fruit likewise are officinal; a decoction of the aromatic leaves is used as the warm bath for women after delivery. In medicinal qualities it is similar to, but weaker than, V. Agnus castus. The decoction of the root is a pleasant bitter and is given in cases of intermittent fever. Fruit considered vermifuge in Behar.—*O'Shaughnessy, page* 435. *Drs. A small tree found in south-eastern Asia, not uncommon near the sea, in Ceylon, much cultivated by the Burmans, it bears a little but pretty blue flower. Both leaves and flowers are rather agreeably heavy scented. In the Dekhan, it is a common shrub generally to be met with growing in patches in moist places, appearing in April and May, but more or less throughout the year. Young shoots round and villous. Leaves slightly bitter, but of delightfully aromatic taste and smell, are deemed powerful external applications in rheumatism, sprains, &c. The powdered leaves are said to cure intermittent fevers. The fruit in powder is given usually in electuary or decoction, for amenorrhœa and several other diseases. The leaves are used to stuff pillows, to cure catarrh and headache. The flowers are prescribed in Behar with honey, in fevers attended with vomiting and much thirst. In the Punjab it is used in special diseases, and after parturition, also to produce appetite and increase the bile.—*Dr. Hamilton Buchanan. Powell Hand-book, vol.* i. *p.* 364. *Mr. Mendis. Thw. En. Pl. Zeyl. p.* 244. *Mason. Riddell. Sir William Jones, 4th vol. Asiatic Researches, p.* 293. *Ainslie,* ii. *p.* 238. *O'Shaughnessy, page* 484.

VITI-VER or Vetti-ver- TAM. Cuscus root, root of Andropogon muricatus.

VITIS, a genus of plants of the natural order Vitaceæ. The species growing in the East Indies are—

adnata,
angustifolia,
auriculata,
carnosa,
cordata,
elongata,
glandulosa,
glauca,
indica,
lanata,
latifolia,
lanceolaria,
muricata,
Neilgherrensis,
pallida,
parviflora,
pedata,
pentagona,
quadrangularis,
serrulata,
setosa,
vinifera.

They are climbing plants, found in many parts of Asia, Europe and America, and one species, V. vinifera, the common vine or grape vine, is largely cultivated all over the world from near 55° N. lat. to the equator, but in south latitudes it only extends as far south as 40°. It is cultivated at various elevations. In middle Germany it ceases from about 1,000 to 1,500 feet above the level of the sea. On the south side of the Alps it reaches 2,000 feet; in the Apennines and Sicily 5,000 feet; and on the Himalaya as high as 10,000 feet above the level of the sea. The point of the greatest importance in the ripening of the fruit of the vine is the length of the summer. Thus, although the maximum of summer heat is as great at Moscow as in Paris, yet the vine will not ripen its fruit in the former place, and this arises from the fact that although the greatest heat of the months of June and July are as great as that of Paris, the months of August and September are several degrees below. England, also, has a mean temperature as high as many parts of the world, where the vine flourishes in the greatest perfection; but it will be found that although England is warmer than these countries in the winter, it is not so warm in the months of September and October, at which time the vine is ripening its fruit. A multitude of varieties of this plant have been recorded, both occurring wild and resulting from its very extensive cultivation. Like most extensively cultivated plants, it is very difficult to ascertain of what country the vine is originally a native. It is among the plants of which we have the earliest records in the books of Moses, and from which it appears to have been made use of in the same manner as at the present day. Although the vine is found in many places wild, it may still be doubted whether it is indigenous there, on account of its frequent cultivation. There can be little doubt of its being truly indigenous in the East, in the district between the Black and Caspian seas. In the forests of Mingrelia and Imiretia it flourishes in all its magnificence, climbing to the tops of the highest trees, and bearing bunches of fruit of delicious flavour. In these districts no cultivation of the vine exists, and the inhabitants seldom harvest the abundance of fruit that is produced. In many spots in France, Germany, Portugal and Italy, the vine is found wild, but the fruit is very generally of an inferior kind, and it may be doubted whether it is truly indigenous in any part of Europe. There are three or four species of Vitis in Tenasserim.—*Eng. Cyc. Voigt, Hort. Suburb. Calcuttensis. Roxb. Flor. Indica. Wight, Icones. Mason's Tenasserim.*

VITIS INDICA. LINN.

Vitis rugosa, *Wall.*

Shembra vulli, MALEAL. | Amdhuka, BENG. HIND.

A wild shrubby climbing plant in the plains of India, and not uncommon in hot jungles, even at a considerable distance from the foot of the mountains, common throughout the Deccan and in the Tenasserim provinces; this is seen creeping over every hedge and bush, and has sometimes been mistaken by Europeans for the true grape vine, but the fruit is acrid, like all the indigenous species, and not edible even to a native. In the Himalaya however, it produces beautiful clusters of round purple berries and a large grape which is very fair eating; it is not the common vine of Europe, which nevertheless is probably this Himalayan plant, the Vitis Indica. The origin of the common grape being unknown, it becomes a curious question to decide whether the Himalayan Vitis Indica is the wild state of that plant: a hypothesis strengthened by the fact of Bacchus, &c. having come from the East. Dr. J. L. Stewart has not distinguished between V. indica, V. lanata and V. vinifera; he says V. lanata, with velvetty, white or red backed leaves, appears to run into the glabrous leaved wild one. In the N. W. Himalaya they are generally found at from 3,000 to 6,000 feet and appear to give both purple and green fruit, and Dr. Thomson says that specimens of V. vinifera are scarcely distinguishable from V. indica, *L.—Dr. J. L. Stewart Punjab Plants, p.* 33. *Thomson's Travels in Western Himalaya and Tibet, p.* 349. *Hooker. Him. Jour. vol.* ii. *p.* 187. *Drs. Riddell. and Mason.*

The common vine or grape vine seems to have been a native of N. W. Himalaya, the Caucasus, and Asia Minor, but is now cultivated throughout the world, and many varieties have been produced. In the Dekhan, the trees are reared from slips taken at the time of first cutting after the rains, and when ready to be removed are put about seven or eight feet apart. They are for the first twelve months trained on dry sticks; after that, a large straight branch of the pangrah, Erythrina Indica, with a fork left at the top to support the vine is placed about twelve inches from it; if put at a greater distance it is apt to give a bend to the vine which is hurtful. The vine cannot be too straight, and the length of the prop should be about five feet. The fruit is cultivated in the greatest perfection in all parts of the Deccan, and the finest flavored are found in the gardens in the neighbourhood of Dowlatabad, about nine miles N. W. of Aurungabad. Its agreeable sweet acid flavour when ripe has always rendered it a very desirable food when fresh. The ancients, also, there can be little doubt, were in the habit of drinking the expressed juice of the grape before fermentation. Grapes are also dried and used under the name of raisins. The drying is generally effected by cutting half through the fruit-stalk whilst they are suspended on the tree. Grapes thus dried are called Muscatel raisins, and principally brought from Spain and the Levant. The different kinds of raisins in use in India called Monuka, Kismis and Bedana, are brought chiefly from Istalik. Another small sized dried grape called currants, are the produce of a vine which grows in Zante and Cephalonia. The grapes of Kashmir are not equal to those of Cabool, possibly from the little trouble taken in rearing them. In many parts of the Punjab the vine thrives quite as well as in Europe; it seems to be indigenous in Hazara, and possibly also in the Salt Range. Its tendency is to grow too luxuriantly, so that it all goes to wood and leaves, and this might probably be counteracted by proper cultivation and by choosing a poor rocky soil, and selecting suitable varieties of vine. It is found in the Sutlej valley between Rampur and Sungnam at an elevation of 7,000 to 9,000 feet, but the grape is an uncertain crop. In Kanawar a spirit prepared from the juice is compared to grape-brandy by Hoffmeister. This spirit is called by the usual Arabic term arrak, and a wine also (sheo) is made there. The circumstance that the hindu name is applied to this and the barley brandy of Lahoul would seem to imply that the art of distillation has been introduced into these countries from below. In Afghanistan, Bellew states that a grape wine is prepared, which is consumed by well-to-do mahomedans, and a raisin wine for hindus. *Powell's Hand-book of the Punjab. Dr. J. L. Stewart Punjab Plants, p.* 35. *Dr. Cleghorn Punjab Reports, p.* 65. *Dr. O'Shaughnessy Bengal Dispensatory, pages* 251-254. *Royle Him. Botany. Riddell, Gardening.* See Grapes, Vitis, Wine.

    1 Gen. Hyæna, 1 sp.
   Sub-Fam Viverrinæ. Civets.
    7 Gen. 31 sp. viz.: Viverra, 5 sp.; Prionodon, 1 sp.; Parodoxurus, 10 sp.; Paguma, 1 sp.; Artictis, 1 sp.; Heupestes, 12 sp.; Urva, 1 sp.
  Fam. Canidæ. Dog tribe.
    3 Gen. 14 sp. viz.: Canis, 5 sp.; Cuon, 1 sp.; Vulpes, 8 sp.

Of the genus Viverra, known as civet-cats or genets, four species occur in the East Indies, which may be thus noticed.

VIVERRA CIVETTINA. Blyth.

V. Zibetha, *Water.* | Malabar civet-cat.

Found in the forests of the Western ghauts, and is destructive to poultry.

VIVERRA INDICA. Geof.; *Hodgson.*

The glossy genette, the civet of Europeans, is common in the northern province of Ceylon. —*Tennent's Sketches Nat. Hist. of Ceyl. p.* 32.

VIVERRICULA MALACCENSIS. Gm.

V. malaccensis,	*Gmelin.*	V. bengalensis,	*Gray.*
V. Rasse,	*Horsfield.*	V. pallida,	,,
V. Gunda,	*B.Ham. MSS.*	Genetta manillensis,	*Eydoux.*
V. indica,	*Geoffroy.*		

Malacca civet.	Eng.	Kasturi,	Mahr.
Lesser civet.	,,	Jowadi manjur,	,,
Katas,	Beng.	Punajin bek,	Can.
Gando-gokal,	,,	,, pilli,	Tel.
,, gaula,	,,	Sayer,	Nepal.
Musk-billi,	Hind.	Bug-nyul,	,,

This is found throughout India and the Archipelago. It lives in holes in the ground or under rocks. It can be quite domesticated. The Indian civet-cats secrete an odoriferous substance identical with civet, though not the civet of commerce. This species is not infrequently found in the Tenasserim villages, and its secretion enters into the Burmese materia medica.—*Blyth. Mason.*

VIVERRA TANGALUNGA. Gray. Inhabits the Malay peninsula and the islands of the Archipelago as far east as the Philippines.

VIVERRA ZIBETHA. Linn. Zibeth civet.

V. Zibetha,	*Linn.*	V. melanurus,	*Hodgson.*
V. Bengalensis,	*Gray.*	V. orientalis,	,,

Katas	Beng.	Kung.	Bhot.
Mach-bhondar	,,	Bhran	Nepal.
Bagdos	,,	Nit biralu	,,
Pudo-gaula	Bhot.	Saphiong	Lepch.

Inhabits Central India, Cuttack, Orissa, Bengal, Assam, Burma, Malayana, and China. It is destructive to poultry and game. Civet is obtained from the sub-caudal gland of this animal, which is 2½ inches in diameter, and in some places the animal is kept in confinement and the drug is collected periodically. —*Jerdon Mammals, Horsfield Catalogue.* See Mammalia.

VIVIAN, General Sir Robert J. Hussey, K. C. B., of the Madras Army. In 1818, entered the military service at Madras, and rose by gradual steps of promotion until he became a Major-General in 1854. He commanded the

Turkish Contingent in the East during part of the Crimean war, and shortly afterwards was nominated one of the Board of East India Directors.

VIZAGAPATAM, a town on the eastern coast of the peninsula of India, in lat. 17° 42′ N. long. 83° 17′ E. Vizagapatam is the chief town of the district, and has a convenient harbour ; vessels of 300 tons have been built there. Much work of horn and ivory and silver is performed. Ankapilly is another wealthy town, also Vizianagram. The population of the district is 1,254,272. Vizagapatam, as a Madras collectorate, formed part of the Northern Circars, in the low country between the Eastern ghats and the Bay of Bengal. Large supplies of Sal (Shorea) and Yegis (Pterocarpus marsupium) timber find their way to the coast in the north part of the Vizagapatam district, and in the whole of Ganjam.—*Conservator's Report*, p. 12.

VIZIANAGRAM, a town and military cantonment near Vizagapatam.

VIZIADROOG, in the Conkan ; its flagstaff is in lat. 16° 34′ N.

VIZIANAGAR, in 1441 was visited by Jamal-ud-din, whom his father Kazi-shah Ruh of Samarcand sent on an embassy to this place. See Nicolo di Conti.

VLASCH. Dut. Flax.

VLOER-TAPYTEN. Dut. Carpets.

VOBILINTA. Tel. Polygonum herniaroides, *Delil.*

VODDU or Woddu. Can. Used for catching fish, is like a large hurdle, the full breadth of the river, and is frequently thrown across a stream as large as the Thames at Richmond. The Coorg race annually place woddu at the heads of the Canara rivers to catch the fish returning from spawning.

VODALA. Tel. Poivrea Roxburghii, *De Cand.*

VODI. Tel. Spathodea Rheedii, *Spreng.*

VODISA. Tel. Cluytia collina, *Roxb.*

VODITE, also Tummeda. Tel. Species of Diospyros.

VODLU. Tel. See Oryza sativa.

VOGEL. Ger. Bird.

VOGEL-LEIM. Ger. Bird-lime.

VOGELS. A group of small islands off the Malay coast.

VOHEMO KADPHISES. See Kabul.

VOHORO, or Wohoro, properly Bohra, of Guzerat, are traders, shop-keepers, and bankers in the west of India. They are of two classes, Sulimani and Dawdi.—*Wils.* See Borah.

VOHU MANO. See Bactria.

VOIGT, C. J., author of Hortus Suburbanus Calcuttensis, published at Calcutta in 1845.

VOLA. Sans. Myrrh.

VOLATILE ALKALI. Eng. Ammonia.

VOLATILE OIL OF CASSIA BARK. Cassia oil.

VOLCANIC ROCKS. In Central India, volcanic rocks spread east and west from Neemuch in the form of basalt, basaltic greenstone, greenstone and greenstone amygdaloid, and southwards by Oujein and Saugor across the Vindhya, assuming a columnar structure in their steep descent to the Nerbudda. The trap across this river meets with sandstone and fossils in the Satpura range, and spreads over all western Berar and the Aurungabad province; it assumes a columnar form at Gawilgurh and Chikaldah, occupies Kandeish and the Concan to Bombay, and passes southwards to Malwa in latitude 16° north ; its southern limits being observed south of Punderpoor, and the right bank of the Kistna towards Bejapore. In the valleys near Homnabad, south and west of Beder, it is seen between and beneath, but never penetrating the great plateaux of laterite hills, and is noticed at Maharajah-pettah, 30 miles west of Hyderabad. The eastern edge of this vast tract of volcanic rocks, after crossing the Nerbudda to the south, skirts the town of Nagpore in Berar, passes Naudeir, onwards to the west of Hyderabad and to its southern limits just mentioned. South of this, as well as to the eastward, the trap only appears as great dykes, from fifty to a hundred yards broad, which run east and west parallel with each other. These dykes can, at places, be traced for a hundred and fifty miles, bursting through the granite and other rocks, tearing the highest of the hills asunder and filling the chasms and crevices with their dark and compact substance. In these provinces, the elements of the trap-rock assume, in the dykes, a variety of lithologic appearances, greenstone, and porphyritic greenstone ; and, in the great volcanic district, basaltic greenstone, hornblende rock, basalt, and amygdaloid, with cornelian, heliotrope, prase, jasper, agates and onyx. The dykes are particularly numerous near Hyderabad, but they occur in the Balaghaut Ceded Districts, in the Carnatic and Mysore almost to the southern cape of the peninsula, and, with very rare exceptions, they run due east and west.

VOLCANOES. The middle of the 18th century was a great epoch of earthquakes all over the world. In 1750 Chili was visited by an earthquake, by which the town of Conception was destroyed : the sea rolled over it, and the entire port from thenceforth became useless. The whole shore seems to have sustained an upheaval of about 24 feet ; and shells similar to those found in the adjoining seas, are now abundant on mountains above

1000 feet high. Lyell's Elements gives it 1848 English feet. On the 15th September 1751, the capital of St. Domingo was destroyed by an earthquake, and part of the coast, 40 leagues in length, sunk down, and has ever since formed a bay of the sea. The Lisbon earthquake, one of the most fearful on record, occurred in November 1755, and in 1757 the Azores were struck with an earthquake, during which eighteen small islands arose about 200 yards from the shore; these corresponded very closely with the Pondicherry explosion.

Volcanic regions occur to the westward of Kurrachee, and on the South Arabian coast, and in the Red Sea. The volcanic band trends away northerly from lat. 2° to lat. 22°, at the mouth and at the lower part of the Red Sea, commencing with Cape Aden, and concluding with Gibbel Teir, extending across from the former of these to the Salt Lake Assal, inland from Tadjpura, and so on towards Shoa.

Aden is spoken of by Arab writers as having been in a state of activity within the historic period, and though there scarcely seems sufficient evidence of this to be relied on, and a very strong presumption to the contrary, it has all the appearance of great recency. The Aden volcano forms the terminal point of Southern Arabia, where the shore, after having inclined gently southward from Ras-el-Hudd, 21° N. lat, at the entrance of the Persian Gulf, to 12°, stretches almost due west till it turns up the Red Sea. At no great distance of time it has obviously been an island, and is now connected with the mainland by a low sandy spit four miles long and half a mile across, only a few feet above high-water mark; the whole shore, indeed, consists of sandy downs or salt swamps, only a little above the level of the sea, and wearing the aspect of recent emergence. The peninsula itself is an irregular oval, five miles in its greater, and three in its lesser diameter. There are numerous little head-lands with sandy bays between, all around it. There is at the head of each little bay and on several points of the shore besides, a level expanse of rolled gravel and sea shells, evidently an old sea margin, brought to light by the same upheaval that converted the island into a peninsula, and raised the isthmus above the level of the sea. The rocks themselves are all lavas of various descriptions, more or less vesicular, and the volcano affords a vast diversity of igneous minerals. There seem to have been, from time to time, a number of craters in the mountain, one of very considerable magnitude, beyond the coal depot betwixt Ras Morbut and Ras Tar Shagan, having been blown outwards, and is now remaining as a valley ascending from the sea. The edge of the principal crater is near the centre of the peninsula. The crater itself occupies the eastern half. It is exceedingly well defined indeed, and at once indicates its origin to the spectator. It is about one and a half mile in diameter, and is nearly circular, affording a circuit of five miles. Of this half a mile has been blown out right down to the level of the sea. The bottom of the crater, on which stands the town of Aden and the British cantonments, is covered with a bed of rolled gravel and sea shells, proving that there has been no trace of eruption since the last general upheaval, which produced the sea beach all along these shores, but which is still believed to have been within the human, perhaps even the historic, period. The Shum-Shum range, which forms about half the wall of the crater, reaches an altitude of above 1760 feet. There is a huge crack or slip which cuts above a third off the eastern side of the volcano, and through a portion of this constituting a narrow gorge or pass, ten feet wide, and twenty or thirty high, the road from Steamer Point enters the crater, and leads to the cantonments. Dr. J. P. Malcolmson supposed this to have been the remains of the latest great eruption of which the effects are chiefly manifest on the table land on the eastern buttress of Shum-Shum; by this the ancient crater was shattered nearly through its centre from the northern to the southern pass, breaking into pieces and separating the whole of the eastern side of the edge of which Seera Island is a fragment, and in these views Dr. Buist concurs. (See London As. Trans. 1836.) On the one side of this which remains, the wall of the crater subsides from 1700 to 607 feet, and then breaks away altogether. The rift probably occurred when the side of the crater was blown out and demolished. The walls of the crater, as now existing, when seen from the cantonments, present the most magnificent view that can be imagined; one semi-circular precipice, five miles in circuit, ascends some 1776 feet from the plain. It is in most places perpendicular. The cliff is of a rusty dark brown colour, and full of caverns and recesses, carved almost like the altar screen of a Gothic cathedral. Great streams of lava may be observed from point to point, as if the fiery cataract had been arrested in its progress, and congealed as it flowed from the lesser rents of the principal crater. On many parts of the rock, 500 feet above the level of the sea, to the level of Shum-Shum, great masses of volcanic ashes are strewed amongst the crevices of the rocks; these generally abounding, as does the surface all around, with sea shells in a state of great decay, to all appearance borne up by the volcano on its last emergence from the deep.

Right across the bay to the eastward, at a distance of five miles, are the magnificent remains of another crater, called Jab'l Hassan. It is nearly of the same size and form as Aden, but rests on the mainland. The centre peak attains an altitude of 1237 feet, and on sailing round, in certain aspects, it presents the appearance of a stupendous Gothic cathedral ; two peaks of 700 feet, close beside each other, have obtained the very unpicturesque name of the Ass' Ears, from the appearance presented by them far out at sea. Seven miles beyond this, and seventeen from Aden, another fragment of a cone of smaller size but considerable beauty rises up to the altitude of 700 feet and projects about three miles into the sea, while half-way betwixt this and the strait, Jab'l Kurruz or St. Antony, apparently a volcano, reaches an elevation of 1772 feet. Barren Peak and the high range of Jab'l Arrar, or the Chimney Peaks, just opposite the strait, have been all set down by the surveyors as hills of volcanic origin. The range from this bends northward and follows the line of the shore of the Red Sea. From Aden to Bab-el-mandeb, indeed, the rocks along the Arabian shore seem to be wholly volcanic for a distance of above 100 miles. On the African shore a singular cove at the upper end of the Bay of Tadjoura, called Joobul Khareb, seems the crater of an old volcano ; it is connected with the Bay of Tadjoura by two narrow channels, the whole width across from coast to coast being about three quarters of a mile, with a small island near the middle. One of the channels is forty yards wide, with sixteen fathoms water ; the other 250, with three fathoms. The cove inside is about thirteen miles in diameter by six, the western portion is volcanic. At its extremity is a basin, or crater, 300 yards in diameter, surrounded by precipitous volcanic cliffs through which the sea makes its way to the water inside ; the entrance is dry at low water. Lava and scoriæ abound everywhere around. The waters of the cove are said occasionally to be violently agitated and disturbed without apparent cause, probably by the emission of gas from below, the volcano being scarcely yet asleep. Off the outer bay, the hills are of limestone, and rise to the height of 2000 feet.

The rocks around the Salt Lake Assal, whose waters are now nearly dried up and encrusted with salt, are all volcanic on the eastern side. A bed of lava, containing several deep fissures, separates the waters of the lake from those at Joobul, or Guba-el Kherab, of which it appears to have been a continuation. The lake is in 11° 38′ 12″ N., and 42°30′ 6″ E., it is about seven miles across in its larger diameter and 570 feet below the level of the sea. For about 300 miles westward into the interior the whole country seems volcanic.

To the south-westward of this, near Shoa, is the volcano of Jab'l Abida, about 4000 feet high, its crater opening to the N. W., and about two and half miles in diameter, and further on the still higher peak of Aiullo. Here, there is an even plain about thirty miles in diameter, studded with small cones, of which as many as twenty may be counted at once, each exhibiting a distinct and well formed crater. The lava everywhere around is fresh and glossy, but no tradition exists of any eruption having occurred within the memory of man.

The volcanic peaks of the High Brothers are just outside the gut of the Strait of Bab-el-mandeb on the African shores. The island of Perim, which occupies a portion of the strait near the Arabian side, with the Bab-el-mandeb Peak on the mainland close by are masses of lava. Along the African shore, from lat. 11° to lat. 14° and from long. 42° to long. 44° the series of volcanoes is uninterrupted for the space of 400 miles, running into the interior about 10° N. towards Ankobar, long. 40° E. How far the volcanic district extends into the interior along the African shore within the Strait of Bab-el-mandeb does not appear. A range of hills above fourteen miles from the sea to which it is nearly parallel is set down on the chart as mostly volcanic. There is a second chain of very high mountains parallel to this again, about fifty miles further to the west, but its character does not appear to have been ascertained.

On the Arabian shore, from lat. 30° to lat. 15°40′, for a distance of nearly 200 miles, a range of hills of volcanic origin is set down on the map about twenty miles from the shore, with a second range behind them, like that on the African side, undescribed. The lower range is a continuation of the Aden volcanoes, thus extending in a continuous line for above 300 miles along shore. There can be no reasonable doubt that the whole basin of the Red Sea, here about 100 miles across, from the Arabian to the African chain of peaks, is volcanic, studded as the intermediate channel is with cones now in a state of activity, so that the ascertained area of this region from Aden to near Ankobar, and from this to Jab'l Teir is about 350 miles from E. to W. and 450 from S. to N. Within the channel of the Red Sea the most conspicuous peaks are the Harnish Islands, and Jab'l Googur, betwixt lat. 13° 40′ and 14°, the Zebeyar Islands in lat. 15° and

Jab'l Teir in lat. 15° 30′. A violent eruption of short continuance occurred in the Zebeyar Islands on the 6th August 1846. Jab'l Teir has for nearly a century been known to be in a state of constant activity. It was visited by Bruce in 1774; it then gave out smoke, and was said occasionally to emit flame and stones; he describes the masses of lava as having shells embedded in them, a circumstance that has not, so far as has been observed, been noticed by any other traveller. It was visited by Capt. Elman when engaged in survey in 1838, and by Dr. Kirk in 1841.

The island is circular, about seven and a half miles round, and estimated variously from 300, 500 and 900 feet high, resembling on being approached, a hill of considerable elevation rising from a plain terminating in a bluff steep on the eastern extremity. The summit of the hill is about 300 feet above the sea level, there are no soundings close in shore, at 150 fathoms, so that the visible portion is merely the summit of a hill the base of which is hid by the water, in all probability 1,109 feet high, or 1,900, if the altitude of 900 feet assigned it by the chart be correct. The whole surface is covered with ashes, lava, and cinders; near the summit there are about fifteen small open craters, from several of which steam and hot air are continually issuing and occasionally smoke. Streams of indurated lava are seen to proceed from these chiefly towards the, east side of the island. It is said to have been on fire about 1828 or 1830. One of the peaks in which it terminates exhibits the remains of two craters of about twenty-five feet in diameter; both have fallen in. A single crater of much more recent formation than the others appears in the northern peak of Jab'l Teir, it seems the northernmost of the volcanoes in the Red Sea, and probably limits the band.

The following letters from Commander J. W. Barker, Indian Navy will set the question as to the Zebayer eruption completely at rest. The smoke was first pointed out to him by Assistant Surgeon Nicolson, and seen by all on board the Victoria not at one moment, but at different periods; and at the time it was first seen, the Hindostan was to N. N. W. of the Quoin Rock, the northernmost of the Zebayer group, and distant from the Victoria at least 16 or 18 miles in a contrary direction.

14th August 1846, 8 A. M.—Passed Jibbel Teir all sail set with a light breeze from N.

9 A. M.—A heavy black cloud, rising rapidly from the S. W. which in half an hour formed into about a dozen large water spouts.

10 A. M.—Saw the Quoin Rock.

10-30 A. M.—The squall burst upon us with heavy rain and blowing furiously, with much lightning and a continuous roll of thunder, which had a very peculiar sound, as if close upon the water. Hauled out S. by W. ship steering previously S. S. E. At 11-30 the rain abated a little: saw the Zebayer islands bearing easterly, distant about seven miles and a steamer between us and the islands distant from about four miles. The weather continued thick and squally, with much lightning, till we got as far as Mocha. Barometer was very slightly affected by it. Mr. Henry P. Lovell, Acting Commander Steamer Hindostan, was on board the steam vessel Victoria at the time that Commander Barker alludes to, and he noted down at the time all the circumstances relating to this sudden outbreak of Saddle Island, and gives the substance of his notes, from which will at once be seen the facts of the case:—He adds '14th August 1846, off Zebayer Islands, lat. 15° 7′ long. 42° 12′, on the voyage to Suez. The whole forenoon has been calm and excessively sultry. Skies overcast; particularly dark and threatening towards the N. W. Thermometer 95°. Sighted the Peninsular and Oriental Steamer bound for Aden; she passed about four miles to the west of us as we were closing in with the group of islands. Soon after she passed a violent squall from the N. W. burst upon us. It was accompanied by a drenching shower of rain, heavy peals of thunder, and vivid flashes of lightning. Ship going about eight knots during the forenoon—reduced to three knots when the squall came on; temperature brought down to 80 degrees. Passed along the western side of the Zebayer group of islands. When opposite to Saddle Island (one of the Zebayer group), and only about three miles distant from it, observed a column of smoke issuing from the summit of one of its cones. The squall was then at its height. The column gradually increased in size, while at the same time, distinct jets of smoke issued, as if from numerous small apertures round the outer margin of the cone. Before the squall burst, the summit of the island was perfectly clear. After passing the island, and while it continued in sight, we observed the smoke.

The above furnishes one more illustration of the intimate connection betwixt earthquake, volcanic, and meteorological phenomena so well adverted to by Captain Baird Smith. During the Cleopatra's hurricane of the 19th April 1847, and again at the period of the land squall on the 6th April 1848, the magnetic instruments at Bombay continued in a state of great disturbance for upwards of two days.

An eruption of a volcano occurred near Edd on the African shore of the Red Sea, about half way between Massowah and the Strait of Bab-el-mandeb. A native of that village stated that "on the night of the 7th, or morning of the 8th instant, the people of Edd were awakened by the shock of an earthquake followed by others, which continued with little intermission. For about an hour at sunrise, a quantity of fine white dust fell over the village like rain. About noon the character of the dust appeared to change, and then resembled red earth; shortly afterwards it increased to such an extent that the air was perfectly darkened, and we had to light lamps in our houses. It was darker than the darkest night and the whole place was covered with this dust nearly knee deep. On the 9th the dust somewhat abated, and we were able to see a little in our houses without lights. At night we saw fire and dense smoke issuing from a mountain named Jab'l Debbesh, situated about a day's journey inland, and this continued all the time I remained at Edd. The ashes only fell for two days, and sounds like the firing of guns issued from the mountain. This mountain is inhabited, but no one had reached Edd thence, when I left; nothing of the kind had ever been heard of before, and the people are exceedingly frightened." This account was afterwards amply confirmed from other sources, and the most remarkable feature of the case is the immense extent affected by the disturbance. The officer commanding the detachment at Perim heard the sounds emitted by the volcano distinctly, and attributed them to a bombardment. He reported that the firing commenced about 2 A. M. on the 8th instant, and continued with long intervals up to the 10th or 11th. The general idea at Perim was that the sound proceeded from the African coast. The firing on the 8th was very heavy and continued for 9 or 10 hours. Both the steamers Candia and Ottawa reported having had two very hot days in the lower part of the Red Sea, and on the 10th instant they encountered what appeared to be like a London fog, which continued for several hours. The captain of the latter vessel described this fog as consisting of very fine dust, so thick that he could not see the length of the ship, and during its continuance the weather was perfectly calm. On the 8th of the month several shocks of an earthquake were felt at Mocha and Hodeida; and there, as well as along the entire coast of Yemen and inland as far as the mountain range, the dust described as white ashes fell for several days. The noises were also heard, and as usual, were attributed to artillery. The Nacoda of a boat which brought a letter from Mr. Barrow was detained ten days in the Dhalae Archipelago unable to continue his voyage owing to dense clouds of dust which darkened the air; many other Nacodas reported the same thing, and one brought a specimen of this dust, which he said had fallen on his ship in such quantities that he could not keep his proof clear by continual sweeping. The dust appears like very finely powdered pumice containing minute particles of mica.

Although the greater part of the shores of the Red Sea are undoubtedly of igneous origin, no active volcano has been known in modern times save in the Zebair Islands, one of which was observed in a state of activity by the commander of the I. N. steamer Victoria in August 1860.

There is no information whatever as to any volcanoes in the interior of Arabia, or to the northward.

An extinct volcano, called Mount Nimrod, is described by Mr. Chancourtois as existing near the Salt Lake Van in Armenistan, on the frontiers of Persia, between the 38th and 39th degrees of latitude.

On the banks of the Euphrates, near the city of Hit, in the region of the petroleum wells, Dr. Winchester found scoria on the summit of a detached hill about eighty feet above the level of the plain; no other volcanic appearances were observed.

Lyell in his Principles of Geology, 1832-1851, remarks that the city of Oujein was, about fifty years before the christian era, the seat of empire, of art, and of learning, but in the time of the rajah Vicramaditya, it was overwhelmed, together, as tradition reports, with more than eighty other large towns in the provinces of Malwa and Bagur, 'by a shower of earth.' The city which now bears the name is situated a mile to the southward of the ancient town. On digging on the spot where the latter is supposed to have stood, to the depth of fifteen or eighteen feet, there are frequently discovered entire brick walls, pillars of stone, and pieces of wood of an extraordinary hardness, besides utensils of various kinds, and ancient coins. Many coins are also found in the channels cut by the periodical rains, or in the beds of torrents into which they have been washed. A large quantity of wheat was found by a man digging for bricks. It was almost entirely consumed, and in a state resembling charcoal. In a ravine cut by the rains, from which several stone pillars had been dug, Mr. Hunter saw a space from twelve to fifteen feet long and seven or eight feet high, composed of earthen vessels, broken and closely compacted together. It was conjectured, with great appearance of probability, to have been a potter's kiln. Between this place and the new town is a hollow, in which, tradition says, the river Sipparah formerly ran. It changed its course at the time the city was buried, and now runs to the westward. The soil which covers Oujein is described as being of an ash grey colour, with minute specks of black sand. That the shower of earth which is reported to have fallen from heaven, was produced by a volcanic eruption, we cannot doubt, although no information has been obtained respecting the site of the event, and the nearest volcano of which we read is that which was in eruption during the Cutch earthquake in 1819, at the distance of about thirty miles from Bhooj, the capital of Cutch, and at least three hundred geographical miles from the town of Oujein.

Captain F. Dangerfield, who accompanied Sir John Malcolm in his military expedition into Central India, states that the river Nerbudda, in Malwa, has its channel excavated through columnar basalt, on which rest beds of marl impregnated with salt. The upper of these beds is of a light colour, and from thirty to forty feet thick, and rests horizontally on the lower bed, which is of a reddish colour. Both appear from the description to be tuffa composed of the materials of volcanic ejections, and forming a covering from sixty to seventy feet deep overlying the basalt, which seems to resemble some of the currents of prismatic lava in Auvergne and the Vivarais. Near the middle of this tufaceous mass, and therefore at the depth of thirty feet or more from the surface, just where the two beds of tuff meet, Captain Dangerfield was shown, near the city of Mhysir, buried bricks and large earthen vessels, said to have belonged to the ancient city of Mhysir destroyed by the catastrophe of Oujein. But Capt. Dangerfield in reference to Mhysir, seems to have believed the earthy mass on the banks of the Nerbudda alluvial, not volcanic. Mr. Hunter seems to have written as to the volcanic action from hearsay. Conolly, on the other hand, speaks from careful and minute personal observation, he being one of the most exact and observant writers of his time; but another writer says the theories which account for the change of site of Oujein appear to him all equally unsatisfactory. He neither believes with Hunter that a shower of earth nor with Malcolm that a flood, overwhelmed the old city, nor with the natives that it was turned topsy turvy. The tales of old bricks, and of wood of surprising hardness, &c. dug up at depths of fifteen feet seem exaggeration. Several people were interrogated who had been twenty and thirty years at the place, none of them had ever positively seen such things though all believed most religiously both these and much more wonderful curiosities to be found. The theory of an inundation is principally supported by a tradition that the river has changed its bed.

Capt. R. L. Playfair, officiating Political Resident, Aden, wrote an account of the outburst of the volcano near Edd on the African coast of the Red Sea. At Edd, lat. 13°57′ N, long. 41°4′ E, about half-way between Massouah and the Strait of Bab-el-Mandeb, earthquake shocks occurred on the night of the 7th of May or the morning of the 8th during about an hour. At sunrise fine dust fell, at first white afterwards red; the day was pitch-dark and the dust was nearly knee-deep. On the 9th the fall of dust abated, and at night fire and smoke were seen issuing from Jab'l Dubbeh, a mountain about a day's journey inland, and sounds like the firing of cannon were heard. At Perim the sounds were heard at about 2 A. M. on the 8th, and at long intervals up to the 10th or 11th. The dust was also met with at sea; and along the entire coast of Yemen the dust fell for several days. Several shocks were felt on the 8th at Mokha and Hodaida.

Further to the east the region of recent direct volcanic action seems to terminate with the extremity of the delta of the Ganges. [Col. Canseley, Bl. As. Trans. vol. XVII. p. 1.] A few hot springs are all we have to indicate the agency of a subterranean fire for nearly 1000 miles across the peninsula. There are hot springs in the Damoodah valley, 23° 10′ N., in Gangetic India, in Kunawar, in the lower Himalaya, and near Lohunkund on the Sutlej. The most notable of these is that at Sargunga, near Chota Nagpore, in Central India, where the temperature of the water is 184°: it smells strongly, and seems to be a Harrowgate.

Indications of active volcanic action are numerous, and in the valley of Kashmir, Dr. Falconer reports that a singular 'field of fire' exists in the valley, of considerable dimensions, and through crevices in which flames continually issue. The outlines of this volcanic tract are distinctly defined, and the action appears to be strictly local; the soil is completely burnt, and in some spots has been vitrified. The igneous action has continued now for upwards of two centuries, as the existence of this remarkable spot is certified by Abul Fazil, the learned minister of the Emperor Akber. [Second Report on Geology of Hyderabad.] Dr. Vosey describes a hot saline spring near Hyderabad in the Deccan, and hot springs occur in four places in Ceylon, in the Tannah collectorate of Bombay, in Sindh, in Kattyawar, at Basman in Beluchistan, in Bheerbhoom, near the Parbutti or Poorub river in Ladak, and other places. (See Hot springs.)

Mr. Moorcroft in his Travels in the Himmalayan Provinces, vol. ii. p. 277, mentions a hill within three days' journey of the city of Cashmere, from which loud explosions are heard at intervals, accompanied by the escape of gaseous matter, with force sufficient to tear off the doors and windows of buildings situated upon it. There was nothing on the hill resembling a crater, but the inhabitants on the spot asserted a distinct recollection of the explosions.—[Bl. As. Trans. vol.XII, part II for 1843, p. 1046.] In the Concan there are no fewer than twelve hot springs betwixt Dasgaum and South Rajpore, and they are supposed to follow the line of the great Ghaut chain southward to Ceylon: the majority occur near the great lines of dislocation. There are two hot springs in Candeish and several in Katiawar, and lower Sind, as we shall presently see, abounds with them.

Lake Loonar, in the Sichal Hills, is the only instance of a volcanic outburst observable in this immense volcanic region. [Malcolmson, London Geological Transactions, 1839.] It was first described by Lieut. Alexander in the Madras Literary Transactions, subsequently by Mr. Orlebar in the Bombay Geographical Transactions. It is a nearly circular or oval depression in a country composed entirely of tabular and nodular basalt; it is 500 feet in depth, and three or four miles in circumference. In the bottom of the hollow is a lake five feet deep, the waters of which are impregnated with muriate and sulphate of soda, and sulphate of lime; subcarbonate of soda prevails in the neighbourhood. In 1851 it was examined by Dr. Bradley, who met with abundance of scoriæ in the neighbourhood, and was able to trace a vast stream of lava to the east and westward. The great intervals betwixt the points of volcanic activity in this part of India, even when connected by hot springs, prevents them from being associated as groups anywhere betwixt Arracan and Cutch.

On the 27th May 1846, a hill on the Nerbudda, called Dumoh Phar, or smoking mountain, about 500 feet high above the plain, gave out alarming moans, to the terror of the neighbourhood, and then an enormous outburst in it occurred. The appearance this presented when examined shortly afterwards by Col. Skene and Lieut. Briggs was such as might have been produced by the explosion of a mine, making a rent in the hill from top to bottom about thirty feet across, and six feet deep. Great trees were upset by it, and the rocks rent twenty to thirty feet in pieces, as if blasted by gunpowder, and thrown to the opposite sides of the fissure. The appearance presented in no way resembled that of a landslip, the bursting force had obviously been from the interior. It was not stated that any erupted matter had been thrown out; there was no appearance of any volcanic vent in the neighbourhood, and no tradition of volcanoes ever having existed. [Bl. As. Trans. vol. XVI.]

In the end of October 1849, something like an ebulition of pestilential gas, the discharge probably of a submarine volcano, occurred off Porebunder in Kattiawar, and was manifest for thirty or forty miles out at sea; the fish were poisoned by it, and for days lay floating in myriads on the surface of the water. [Report of 1850, Bomb. Geog. S.] An incident similar to this had occurred at Berhampore in May 1810; the water in a large tank, usually pure, and which for a period of thirty four years had never exhibited any thing extraordinary, suddenly became of a dark green colour, and an immense quantity of fish, many of them weighing from eight to fourteen pounds, floated dead on the surface, and were afterwards removed in cart loads, and made use of as manure; the people ascribed it to an earthquake which then visited Calcutta.

There is no record of the Cutch volcanoes having ever been in a state of permanent activity, and they seem rather to have played the part of spiracles to the gases of earthquakes, when "the earth seemed with a kind of colic, pinched and vexed," with fits of vomiting of lava or of flame. On the border of the chain of mountains, and eighteen miles from Lukput, the most westerly town in Cutch, is a hill believed by the hindus at one time to have been a volcano. It has long ceased to emit flame or smoke, but is still an object of worship amongst the hindus. It does not appear to exhibit any vestige of lava, scoriæ or ashes; a bituminous earth, with a strong disagreeable odour, is dug out of the side of it and used as incense in the worship of Assapoora: it is found in small pieces imbedded in the common soil, from which it is separated without difficulty.

On the occurrence of the great earthquake shock of June 1819, vast clouds of dust were seen to ascend from almost every hill or range of hills in Goozerat and Cutch; smoke was in many cases visible, and some flame was perceived. Dr. Thomson, in his account of the Geology of Bombay, published in the Madras Literary Transactions for 1837, after describing the hurricane and earthquake which occurred all along the coast on the 15th and 16th May, (the 26th and 27th new style, exactly 200 years to a day before the occurrence of similar events in 1848,) says:—Besides the appearance of a violent commotion in the atmosphere, and a perceptible concussion in the earth, volcanic action seems to have occurred, if we may be allowed to deduce such an inference from the highly embellished representations of the historian, of giants seen in the air throwing great globes of fire at each other, confusion of human voices in the atmosphere, the trampling of horses, and the sound of warlike instruments. It is added that much of this nature occurred in Salsette and other places. "The metaphorical figures," concludes Dr. Thomson, "expressed in the latter part of the description, are strikingly similar to those employed by Dion Cassius in his account of the eruption which destroyed Herculaneum and Pompei, where we are told giants were seen, and the sounds of trumpets heard in the vicinity." There is so little appearance of any recent volcanic eruption near Bombay, that Dr. Thomson is disposed to ascribe the appearance, probably in both cases, to the meteorological phenomena always coincident with earthquakes and volcanic action. At a place twenty-six miles west from Bhooj, fire was seen in considerable volume to burst forth, a blazing ball was projected into the air and fell to the ground, where it was broken into four or five pieces, on which it became extinguished and invisible. No fragments could be discovered, but the vegetation was found scorched where it fell. On being examined next day, the hill was found rent and shattered, as if something within had sunk. Fire, to a certain extent, was said to have issued from a bituminous hill from which alum is made, near Merv: the height of the hill was considered to have been reduced, and it was rent and shattered into ravines. Near the town of Sinderee situated where a branch the Indus joins the Runn, and which was permanently submerged on the occasion, a number of small cones, six or eight feet in height, burst up from the ground, and continued for many days to emit bubbles of air and mud from their summits. The first and greatest shock occurred about seven p. m. on the 16th June; lesser shocks continued till the 20th, when the volcano called Denodour, about twenty miles N. W. of Bhooj, burst into action, and the movements of the earth immediately stopped; but the authority on which this statement is made is not stated. Vestiges of recent outbursts, though of unknown date, appear at the village of Wage-ke Pudda. A high table land of volcanic matter, about two miles square, has been blown out into a flat basin, the sides being broken into fissures, with craters, ravines, and hollows; and the interior, or bed of the basin, interspersed with hillocks and cones of every variety of colour, black, red, yellow, and white, and with patches of cinders similar to the refuse of a furnace, the whole looking as fresh as if the igneous agents were still in operation. The surface of the table land immediately surrounding the blown out space is covered with burnt iron-stone, similar to septaria, divided into irregular cells. On other parts of the table land, craters of some fifteen or twenty feet in depth have been blown out: they are composed of the materials just described, and are covered with patches of sulphur. [Grants, Geology of Cutch. London Geol. Trans.]

The rocks around the hot springs of Peer Muggen, ten miles west of Kurrachee, consist of nummulite limestone, in some cases highly crystalised, and where the fossils, according to Captain Viccary, occasionally are extensively altered. Two miles further to the westward, occurs the group of Minora hills, about 800 feet above the sea, and 500 above the plain surrounding. On the eastern side a crater has been blown out,—the ruins are scattered around. It is oval in form, about 150 feet in length, and fifty across. The explosion has burst away one of the sides and blown through the strata adjoining. It seems as if a vast deluge of water had for a short time been discharged from it; there is no tradition in existence regarding it, nor is anything known of the date when it was in action. It has clearly been subject to the great changes which have taken place around, though it is probable it preceded the deposit of the post pliocene clays found at its base, as these bear no appearance of disturbance and have most likely been deposited by the sea subsequent to the explosion. There are several other craters of lesser size and more imperfect structure round Minora.

Capt. Carless, who gives by far the best account of this district yet published, speaks of a celebrated hill called Jibel Pubb twenty miles N. W. of the hot springs, of which wonderful stories are related all over the country, but he does not tell us what these stories are.

Capt. Viccary describes the clays as post pliocene. He makes no mention of the crater. I visited it, he writes, and took careful drawings and measurements of it in March 1850. The highly crystaline state of the rock is conspicuous. I confess I could discover no evidence of any material diminution of its fossils around the springs or near the crater. The rocks, which everywhere around are one mass of shells and zoophytes, the corals being often in the most beautifully perfect state that can be imagined, have been in some places highly crystalised, the organic remains being in part obliterated. The crystals are occasionally arranged in beautiful star-like forms, like many members of the zeolite family.

The rocks at the hot springs of the Lukkee Pass appear to be of exactly the same description as those at Peer Muggen, their position in all likelihood due to volcanic influences of comparatively recent existence. The hot springs of Peer Muggen attain a temperature of from 100 to 160, and yield a very copious discharge. The water is perfectly pure, and fertilises the soil around. The hot spring takes its name from Peer Muggen, a mahomedan saint, whose shrine is close by. The coincidence of the sound with the designation given to the long snouted crocodile (muggur) has led to the inference that it means Peer Muggur, the Crocodile Saint. The crocodiles in the tank are of the kind called garial: they are precisely similar to those of the Nile and Ganges. One of the tanks contains nearly 200 crocodiles; there is a spring at no great distance which affords large deposits of sea salt.

The next volcanic group to be met with in this direction is that of Hinglaj, a series of mud volcanoes along the sea board of Lus and now in great activity, very similar in point of form to those of Chedooba. Here there is no appearance whatever of there ever having been any eruption of lava. The first of these are called the koop of Chundra. They are believed to be of divine origin, and to be possessed of miraculous virtues. They are within two days' sail of the port of Kurrachee, and within a hundred yards of the sea; the group of mud volcanoes are known by the name of the Koop of Rajah Rama Chundra. Three of these were visited by Captain Hart: a fourth was seen by him at a distance, and they are said to be very numerous, and to extend some way along the shore, and far into the interior.–[*Extracted from the Reports of the Bo. Geo. Society for May* 1850.]

About two miles from the wells of Tilook Pooree, three hills of extremely light-coloured earth, rise abruptly from the plain. The centre hill is conical, slightly flattened, and divided at the top: it is about 400 feet high: its southern and western sides are more precipitous than the others. The second of the group is about half the height of the first; the two are connected by a causeway about fifty yards in length. The third covers a greater area than either; its apex seems destroyed or broken off, otherwise the characteristics of the three closely resemble each other. They are all indented at the base with numerous chasms and fissures, which run into the interior, and their sides are streaked from the summit down as if with sluices of mud or water overflowing from the crater. A basin of liquid mud about thirty yards in diameter occupies the whole summit of the largest of the three. Air bubbles and jets of mud arise from the basin continually, the semi-fluid mass within being constantly disturbed by them. The whole summit of the hill is crusted over with caked mud. Almost exactly the same appearances are presented by the craters of the two other hills,—with this difference, that in the case of one of them the mud was said to rise and fall, occasionally overflowing the crater, sometimes sinking in it above 15 feet. A fourth hill, similar to those just described, was seen at some six miles off, but 'was not visited.' The water and mud all around is salt. The ground at the base of the hills is full of cracks and rents. It is the same volcanic agency, most probably, which gives rise to the hot springs of Peer Muggen, that supply the famous crocodile tank, which feeds or stimulates the mud volcanoes. Abundance of brimstone is found at no great distance, and one eminence some twelve miles off is known by the name of the sulphur mountain." Capt. Robertson describes the whole district, for an area of probably not less than 1000 square miles, from the Hara range westward, as covered with mud cones, active or quiescent. He spent a fortnight amongst them in 1849 and could discover no particular day on which they were unusually affected: Captain Hart had been told that on Monday they were more active than they were on other days. The native tradition regarding them is, that on the abduction of the goddess Sita by Rawun, Sedashew, a form of Mahadeo, was, amongst others, occupied in endeavouring to discover the place of her concealment. For twelve years he prosecuted his search unceasingly, but without effect. Worn out with exertion, and enraged at the fruitlessness of the task he had imposed on himself, he dashed his sacred cake on the ground. It broke into eighteen pieces, and from every fragment a koop arose. The goddess instantly appeared, and chid his wrath and impieties, assuring him that throughout his wanderings she had accompanied him in the shape of a fly which generally sat on his holy cake. In commemoration of his exertions on her behalf, she ordered that every pilgrim should pay his devotions to one of the koop before visiting her temple. The koop are called by the name of her husband Rama Chandra. On nearing the crater, the holy man who precedes the pilgrims continually cries out, speak Oh! Rama Chandra!—and to their astonishment, accordingly, they find on their arrival the mud at the top in a state of commotion,—evidence to them sufficient that the invocation has been listened to, and the deity is present. A more minute and copious account of the mud craters of Higlaj than that given by Captain Hart is published in the 13th number of the Transactions of the Bom. Br. of the Roy. As. So. for 1850, written by Capt. Robertson of H. M.'s 8th, and it confirms the perfect accuracy of Capt. Hart's account, so far as it goes.

Turning back on the Indus, to the hot springs in the Lukkee Pass, the range of hills in this neighbourhood is composed of little ridges not exceeding 400 feet above the plain of the Indus, their apices with nearly horizontal strata, their sides abrupt and precipitous, and non-nummulitic. The valleys, or intervening spaces between the hills, have been much disturbed. A variegated clay, abounding with gypsum, but containing no fossils, is of common occurrence. A brown, rust-coloured rock is abundantly distributed on the surface in the shape of rounded boulders, the most promising specimens of which are manufactured by the natives at Kotree into iron. Between this and the Indus are numerous low hillocks of aluminiferous clay used for the manufacture of alum by the Sind'hi. The hot springs issue from the bottom from what appears an external crater, of the same general character as those already described near Peer Muggen. There are here several hot springs near each other—they are all salt and sulphureous, the whole valley smells strongly of sulphuretted hydrogen gas which rises in bubbles from the well, and a scum is constantly gathering on the water, which the natives remove and use as sulphur. Near one of the hot springs is an aperture in the rock three inches in diameter, from which, until of late years, a jet of flame used to issue ; it was called the peri's fire by the natives, and is believed to have become extinguished on some infidel having bathed in the neighbouring well.—*Transactions of the Bom. Br. of the Roy. As. So. No.* xiii. *for* 1850, *by Capt. Robertson of H. M.'s 8th. Capt. V. Hart's Pilgrimage to Higlaj, Bom. Geo. Trans.* 1839, *and Reports* 1850, *p.* cviii.

There is a very copious hot and sulphurous spring at Gurmab (i. e., hot well) in the Bolan Pass, about 200 miles to the northward, but the writer is not aware of any between this and Lukhee.—*Col. Campbell's Map.*

The area of the volcanic field of Beila has never been precisely determined : it extends some fifty or sixty miles inland, and at least three times as much along shore.—*Dr Thomson on the Geology of Bombay; Mad. Lit. Trans. Bartolomeo's Voyage to the East Indies, Rome* 1796 ; *Translation* 1800.

" The island of Vaypi, on the north side of Cochin, rose from out the sea in the year 1341 : the date of its appearance is determined by its having given rise to a new era amongst the hindoos called Puduvepa, or the new introduction. Contemporaneously with the appearance of Vaypi the waters, which during the rainy season were discharged from the ghaut, broke through the banks of the channel which usually confined them, overwhelmed a village, and formed a lake and a harbour so spacious that light ships could anchor where dry land formerly prevailed."—*Asiatic Researches, vol. III. p.* 396. *Physical Geography, vol. I. p.* 257, *Ed.* 1851.

One of the most terrible and active group of volcanoes in the world begins with the Banda group of islands, and extends through the Sunda group of Timor, Sumbawa, Bali, Java, and Sumatra, separated only by narrow channels, and altogether forming a gently curved line 2000 miles long ; but as the volcanic zone is continued through Barren Island and Narcandam in the Bay of Bengal, (lat. 12° 15') and northward along the entire coast of Arracan, the entire length of the volcanic range is a great deal more. The band is not limited to Arracan, but extends northward to Chittagong, lat. 22° or 600 miles beyond Barren Island. Lieutenant Colebrook visited Barren Island in 1787, when it was in a state of violent activity ; he does not seem to have landed on it, and he quotes entire the account of it given by Capt. Blair in his survey of the Andaman Islands. The cone which springs from near the level of the sea, rises at an average of 32° 17' to 1800 feet nearly. Later authorities make it 500 feet, and this is probably its true altitude. Mr. Lyell gives the following account of it quoting Von Buch as his authority, " Barren Island is in the Bay of Bengal, and as an illustration of the phenomena of ancient craters, of elevation, as contrasted with modern craters of eruption, permitting a contrast of the ancient crater of elevation with the cone and crater of eruption in its centre. When seen from the ocean this island presents on almost all sides a surface of bare rocks, which rise up with a moderate declivity towards the interior : but at one point there is a narrow cleft, by which we can penetrate into the centre and there discover that it is occupied by a great circular basin, filled by the waters of the sea, bounded all round by steep rocks, in the midst of which rises a volcanic cone, very frequently a source of eruption. The summit of this cone is 1690 French feet in height, corresponding to that of the circular border which encircles the basin, so that it can only be seen from the sea through the ravines. This seems to be taken from Capt. Blair's estimate of 1800, since upset, as already stated, by Captain Miller, Dr. Adam, and others. Barren Island was visited by Dr. John Adam in 1831. The water close in shore was hot and steamy, while steam and smoke issued from the crater, but no lava or flame. He estimates the diameter of the base at about 800 or 1000 yards, and the orifice of the crater, which occupies the entire summit of the cone, at about 30. Captain Miller visited it in 1834. His account of it is the same in its general features as that of Lyell, but he estimates the altitude of the cone at no higher than 500 feet; and considering the limited distance to which it is visible at sea, this seems to be more correct than other estimates. He sets down the slope of the cone at 45, which would give an altitude of above 1,000 feet, were Dr. Adam correct as to the diameter of the base. He states that it could only be ascended by climbing, and it is probable that Captain Blair's assumption of 32·17, which was determined by measurement, may be near the truth. The volcano, like the others along the bay, is chiefly active during the S. W. monsoon.

Next to Barren Island is the volcanic island of Narcandam, in lat. 13°22′. The cone is about 800 feet high, no soundings are to be had within half a mile of the shore.

Crossing over to the other side of the bay where perfect tranquillity seems for nearly a century to have reigned, we find a period when the Coromandel Coast was as much moved by volcanic agency as that of Arracan itself.—*Report of Calcutta Coal Committee.*

The earliest account we possess of any actual eruption in the Bay of Bengal is that contained in the 1st vol. of the Annual Register, 1776, reprinted in the Bengal Asiatic Transactions of 1847. [Bengal Asiatic Transactions 1847, vol. xvi. p. 499, Reports and Asiatic Researches, vol. i p. 175.] It was written by an officer on board a French East Indiaman, and addressed to his friend at the Hague: there seems no reason to question its perfect accuracy. In July 1757, fires were seen from Pondicherry to break out on the surface of the sea three or four leagues from shore. These blazed out with the greatest fury, throwing up pumice stone and combustible matter. This was accompanied by a noise like thunder, or the discharge of heavy ordnance. An island, a league in length and about the same in breadth, with a cone and crater in the centre, then appeared. A vast quantity of dead fish were afterwards seen floating on the surface of the water, destroyed by the eruption. The sea was some days afterwards so covered with pumice stone that vessels found it difficult to make their way through it, while they ran the risk of being burnt from the showers of hot ashes with which the air was darkened. The island seems speedily to have subsided again as we hear no further mention made of it.

A shoal, called the Goris Bank, was seen by H. M. S. "Melville" in a line joining Pondicherry and Chittagong, and a shoal is noted on an old chart as having been met with by an American ship in the line betwixt Pondicherry and Chedooba; both these have since then disappeared.

The volcanic region in the Bay of Bengal seems, about the year 1750, to have been in a state of general activity. Off the coast of Arracan, the island of Chedooba, situated in lat. 18° 50′ N. and long. 90°40′, is fifteen miles in length and seventeen in breadth or of about 200 square miles in area. Its general appearance is that of a fertile, well wooded island, of moderate height and irregular outline. A band of level land, covered with fragments of coral shells, and gravel, and but a little way elevated above the sea surrounds it: three distinct terraces are visible, the result of so many separate upheavals.—*Captain Baird Smith on Indian Earthquakes, in Bl. As. Trans. vol.* xii. 1842.*Madras Lit.Trans.* 1837 *quoted from Gower's Portuguese India tome* iii. *Capt. Halsted's Report on the Island of Chedooba, Bl. As. Trans.* 1841 *vol.* x. *p.* 434.

Captain Baird Smith gives an account from the "Gentleman's Magazine" of a violent earthquake which occurred at Calcutta in 1737. Twenty thousand vessels of various sizes are said to have been destroyed by the inundation which accompanied it, and 30,000 lives are said to have been lost on the occasion. No volcanic phenomena, strictly so called, seem to have attended it. It took place during a furious hurricane.

The earliest Indian earthquake, of which particulars are given, is that which accompanied the hurricane of 26th May 1618, by which 2,000 lives and 60 vessels are said to have been lost at Bombay.

There are four large volcanoes in Chedooba, detached mounds rather than cones, varying from 100 to 1000 feet above the level of the sea. They are composed of stiff grey clay, with large quantities of singular fragments of stone: their sides are much cut up with rain; their summits, which are from 50 to 240 yards in diameter, are quite bare. Capt. Halsted gives maps of the island of Chedooba and of Regwan, adjoining to it. On the summits of these are numerous well formed cones, from a few inches to four feet in height, and about the same in diameter. On the outside they are hard, within they are filled up with a *thick, uniform, well-mixed* mud, which every now and then runs out at the side or over the edge of the crater, bubbles of gas rising at intervals of three or four minutes; there is no appearance of eruptions of lava scoria, or vestige of the agency of actual fire: some of the volcanoes throw out hot sea water in place of mud: they are most active during the rains, and then occasionally emit flame and stones, as well as mud, throwing these to a considerable height: the stones are obviously torn from the beds through which the water passes; portions of copper occasionally adhere to them. Petroleum wells abound here, as they do all round the neighbourhood. Capt. Halsted visited Chedooba in 1841, and his survey in the "Childers" extended above 100 miles along the coast. The shore here is marked by three well-defined terraces, or raised beaches, covered with coral and shells, and manifestly the result of three distinct upheavals, with considerable intervals—of just a century, the natives believe, betwixt them. (*Mrs. Somerville Physical Geography, vol. I. p.* 254.) The uppermost of these is less conspicuous and distinct than the two lower, but on the western coast a remarkable column of rock stands out on the beach, about 40 feet high, with oyster shells still attaching to it, showing the second line of beach, just thirteen feet above the first. The last of these was said by an old man of 106, who remembered it when he was a lad of 16, to have occurred about the year 1750. Mrs. Somerville speaks of these as the result of gradual upheavals going on within the last hundred years, but it appears to have been the effect of sudden and instantaneous elevation. There is no evidence of any subsequent change of level having occurred within this period along the shores of the Bay of Bengal. Mr. Piddington suggests that it is not unlikely that it may have occurred simultaneously with the eruption at Pondicherry in 1757—natives being proverbially inaccurate as to dates—during the occurrence of violent earthquakes, when the sea washed several times over the lower part of the island, and then permanently retired as the land emerged. Captain B. Smith thinks it likely to have occurred during the Chittagong earthquake of 1762. Immense quantities of fish were found on the recovered land, and the feasting which occurred on these is still a favourite tradition in the islands: no rent occurred in the earth, and no lives were lost, or mischief occasioned: for more than half a century much of the soil remained salt. The elevation has been greatest towards the centre of the line examined, where it is twenty-two feet; at the termination it is thirteen, and at Foul Island nine. Regwan, lat. 18° 37′ 49″ just to the north of Chedooba, is marked by three distinct risings, each about eight feet. The outer portion of the island was said to have been raised about 1760, most likely as Mr. Piddington supposes, in 1757. The original island contains two terraces, about nine feet high—the outer margin is as yet barren; it consists generally of corals, shells, and gravel; the rest is a level plain of rice fields. In the adjoining island of Ramree, or Rumbree, off Kyouk Phyoo, there are some beautiful mud volcanoes, the cones of which are almost all covered with luxuriant casuarina trees—the only places where they are found in the neighbourhood. The craters and expelled matter possess the same general characteristics as those of Chedooba. This was first described by Lieut. Foley in vol. 4th of the Asiatic Journal: the cones are said by him to vary from five to 1500 feet, one peak, called Teaka, reaching the altitude of 3000. Vapour and flame were seen to issue from one of the peaks during the earthquake of 26th August 1833.—*Lieut. McVolloth, R. N. Map of Ragwan. Bl. As. Trans.; Johnstone's Physical Atlas. Dr. Spry. Bl. As. Trans.* 1851, *vol.* x. *p.* 1845. *Lieut. Foley vol.* 4 *of the Asiatic Journal.*

There are various hot springs at Chittagong subject to periodical eruption, and which constantly emit gas and flame.

There is a small volcano near Kyouk Phyoo in a state of constant activity, and which frequently emits smoke and flame. Cottages at the distance of four miles from it were on the occasion of the eruption of 1842 brightly illuminated, yet so little was the heat that the specimens from the crater were no where melted.

Within little more than ten years of the elevation of the island off Arracan a catastrophe, precisely the opposite of that from which Chedooba suffered, overtook Chittagong. During the great earthquake of April 1672, sixty square miles of the lowlands along shore were permanently submerged: Ces-lung-toom, one of the Mug Mountains, entirely disappeared, and another sunk so low that its summit only remained visible.—(*Phil. Transactions* 1763, *given entire in Capt. Smith's paper on Earthquakes, Bl. As. Trans. vol.* xii. *p.* 1047, *quoted in Report of Coal Committee, republished in the India Review,* 1839, *p.* 71.)

Four hills are described as having been violently rent asunder, leaving open chasms, varying from thirty to sixty feet in width. Other mountains and hills were variously disturbed; some were partially thrown down so as partly to disturb the courses of rivers. One eminence became degraded by little and little till it returned to the level of the plain. In the plain, the earth opened in several places, throwing up water and mud of a sulphurous smell. At Barcharra 200 lives were lost on a track of ground that sunk suddenly. It is said that at Arracan the effects of the earthquake of 1752 were not less fatal to human life and property than those of the Lisbon one in 1755; while at Dacca the waters rose so suddenly as to throw all the boats on shore, on its retirement sweeping multitudes of human beings away. From the notices of islands now no longer to be found on the western shore of the Bay of Bengal, in the accounts of Arab navigators, there can be no doubt whatever that numbers of these have been from time to time submerged.—(*Mr. Torrens, Bengal Asiatic Journal Reports, Feb.* 1845, *p.* xxvi; *Ibid p.* xxii. *Ibid Dec.* 1843, *vol.* xii. *Ibid, vol.* ii. *p.* 1117.)

About an hour after sunrise on the 26th July 1843, the inhabitants of Chedooba and Flat Island heard a great noise, and saw fire rising out of the sea; an earthquake had been felt just before; this continued for four days, when, on the 29th, a small island seemed to arise above the surface of the waters. It continued visible for about a month, but it was now the monsoon, and the weather was too boisterous to permit its being approached. In October, on the return of the fine season, search was made for it but no trace of it could be found. A careful survey of the spot was afterwards instituted by order of Government, but no indication of commotion, and no change in the aspect of the shore, or bottom of the sea was discoverable.

On the 2nd January 1845, between the hours of six and seven p. m., about an hour after sunset, the people of Kyouk Phyoo, on the coast of Arracan, were astonished to see the eastern horizon to seaward become brightly illuminated: it continued flickering, like the reflection of distant flame from a ship on fire, for about half an hour, when suddenly immense volumes of flame were seen to burst as if from the depths of the ocean, presenting a most sublime and awful spectacle to beholders. It was accompanied by a low continuous rumbling sound, which seemed to ascend from the bowels of the earth, and was re-echoed from the hills around. The duration of the exhibition is not mentioned, though it was seen by many witnesses: it seems to have been very transient. A vessel was sent out to sea immediately under the impression of its being a conflagration, but saw nothing. Government, on being applied to by the Asiatic Society, instituted a careful survey of the coast, but no change in the depth of the soundings or character of the bottom could be discovered. There can, at the same time, remain on reasonable doubt that the exhibition was volcanic—probably a sudden emission of gas through an aperture or crevice not detected by the sounding line. Three accounts of this most singular occurrence are given with minuteness. The best account is that of Lieut. Hawkins.—(*Reports of Proceeding of the Bengal Asiatic Society for February* 1845, *p.* 24,28, *not indexed. Topography of Assam, by Dr. McCosh. Calcutta* 1837.)

The extreme frequency of earthquakes in Assam would lead to the inference that it was the theatre of lively volcanic action. No fewer than twelve of these occurred betwixt May 1834 and May 1835. "About twenty years ago," says Dr. McCosh, writing in 1837—that is, about 1817, "the natives inhabiting a small knoll near the hill of Goalpara were so terrified by the unusual shaking of their little hill, that they fled from it for safety, and ran to a distance: on their return their houses and hill had disappeared, and a large pool of water, thirty or forty feet deep, occupied its place.

The whole coast from Cape Negrais to Akyab on the eastern side of the Bay of Bengal, the island of Regwan or Flat Island, as well as all the other islets and rocks on that part of the coast of Arracan, are now undergoing the process of upheaval. This fact was brought to notice in 1840, by means of the nautical surveys of the Brig "Childers." The coast from Akyab to Cape Negrais is indented by deep and narrow gulfs similar to the fiords of Scandinavia, and lies within the prolongation of the great volcanic band of the Sunda Islands, which extends from Java to Sumatra, Barren Island and Narcondam: and indeed all the islands on the coast of Arracan bear evident marks of subterranean fire. In the island of Cheduba, 300 miles south-east from the Sandheads, in latitude 18° 51′ N., longitude 93° 28′ East, there are two mud volcanoes which rise to a height of from one hundred to two hundred feet. This line of upheaval is in the direction of N. W. by N. to S. E. by S. It is one hundred geographical miles in length, and varies in breadth from twenty miles to a very narrow strip of islets and rocks. The upheaval has been greatest in the middle of the line. At the Terribles it was 13 feet; at different parts of the N. W. reefs of Cheduba, 22 feet; at the north point of the island 16 feet; in the middle or the west coast 13 feet; at the south end 12 feet; and the islands south of Cheduba to Foul Island, 9 to 12 feet. The first symptoms of upheaval appeared about the year 1750 or 1760, on the occurrence of a great earthquake by which the sea was driven over the land and the effects of which were felt as far as the city of Ava. An earthquake is said to have occurred one hundred years earlier, and the inhabitants believe that a similar phenomenon occurs every century. (*Johnston's Physical Atlas.*) In the island of Kyouk Phyoo, 35 geographical miles north, or nearer the Soonderbuns, a volcanic eruption took place suddenly east of the station.

In Burmah, mud volcanoes, the highest about 15 feet, are situated close to the village of Memboo, nearly opposite to Maghwe on the Irawadi. At little more than a mile from the village, the view opens on a great sea of blue mud, with a few projecting humps in various parts, while several conical hills rise boldly from the great swelling to various heights. From these, inradiating lines, flows of the mud can readily be traced, and at short irregular intervals a hollow gurgling sound is heard, followed by a kind of flop in the mud. On examination, the centre or conical hollow or crater of one of these volcanoes, which was not exactly at the summit, but a little below at one side, was found filled nearly to the brim with bluish gray oily looking mud—liquid mud—about the consistency of heated pitch, although, of course, less adherent. The whole surface of the liquid mud within was observed to heave and swell upwards, till suddenly a great bladder like expansion of the mud was thrown up, and breaking, fell back into the cauldron below with a sudden flop. At each successive throw a portion was ejected, and issuing by a narrow opening, came flowing down the side of the cone in a regular channel which it had made for itself, its surface marked by thin filmy flakes of the earth oil with which it is partly associated. The mud and muddy water thus thrown out are only slightly salt to the taste, but are used largely in the preparation of salt close by, by lixiviating the mud, collecting the water thus passed over it, and concentrating it to crystallization over slow fires.

At Grobagan, at the centre, on the limestone district, is a mud volcano 16 feet in diameter. The black mud every two to five seconds bubbles up and subsides ; it rises to a height of 20 to 30 feet, then explodes with a dull noise, scattering a shower of warm brine springs from which salt is extracted. Its eruptions are most frequent in the rainy season. It is called kuwu, "the place of abode," and an old legend is that it is the residence of a monster snake whose writhings cause the eruptions. Similar mud volcanoes occur in the Taman peninsula of the Crimea.—*Oldham in Yule's Embassy, p.* 341.

With such violent but subterranean forces in operation, even at the present day, it is easy to apprehend how numerous must have been the uprisings and subsidings of the solid matter of the earth during by-gone ages. According to the views which have been adopted from Sir Charles Lyell's prolonged investigations, it is little probable that all these changes occurred at one time, but they must have resulted from a series of great up-pourings from the interior during by-gone ages, identical with those still in operation, though perhaps all in the lines which we observe in the direction of the existing mountain ranges. One of these, prolonged through Arracan, halts at Point Negrais, to reappear through the Andamans and Nicobars ; and this Eastern Asiatic range, after extending along the S. W. coast of Sumatra, terminates at its S. E. point. Another runs along the Malay Peninsula, is lost for a time, but appears again in the high peak of Lingin, and terminates in Banca and Billiton ; and a branch from this separates at Pulo Timon, on the east coast of the peninsula, and ends at Carimata, in the strait between Billiton and Borneo. Two ranges traverse Cambodia and Cochin-China in the same direction, and these will be found to extend to, and, perhaps, to traverse Borneo. Between the Cambodian range and the mountains at Sarawak, on the north-west extremity of Borneo, the Natunas islands and Pulo Condor form the connecting link ; and as the Sarawak hills run to the south-east, the range is probably continued, either by a connected line, or by isolated mountains, until it terminates in the Gunung Ratos, near Cape Selatan. More recent data shew that this range, after traversing the western part of Borneo, terminates on the south coast, a little to the eastward of Kotaringin. The Gunung Ratos would therefore appear to have been formerly connected with the primary range which shows at Bintulu, on the north-west coast of Borneo, and which may be a continuation of one of the Indo-Chinese ranges. The Anam or Cochin-Chinese Range is that which can be traced most distinctly across the Archipelago to Australia at the present day. There seems no doubt that the multitude of islands which are now to be seen are merely plutonic masses upraised by subsequent volcanic action : or the tops of great volcanic outbursts which have appeared above the ocean. There are innumerable coral reefs and coral islands, but Mr. Darwin's essay on the "Structure and Distribution of Coral reefs," has satisfactorily shown that "Atolls" or annular reefs were originally fringing reefs constructed around islands that have since subsided. The depth of water on these banks averages about 30 fathoms, depending rapidly as the edge is approached, and shoaling gradually towards the land. And where the earth has not risen above the surface waters, great submarine banks are to be traced from one island to another. One of these is termed the great Asiatic Bank, and the countries lying on it may be noticed first. The mountain ranges in the south-eastern part of Asia invariably run in a direction nearly N. N. W. and S. S. E., and are all of the primary formation. The chain which extends along the Malay peninsula is the most conspicuous of these ranges, and is continued at intervals to Banca and Billiton, and perhaps may be traced as far as the north coast of Java. It is this range that most abounds in metals, or, at all events, in which mining operations are pursued with greatest success, probably from the strata, owing to its central position, having been little disturbed by the convulsions which have shaken the countries on either hand. The productiveness of the gold mines of the Malay Peninsula and of the tin mines of Banca is well known. This range may be considered as the backbone of the great Asiatic Bank which extends into the Archipelago from the south-eastern extreme of Asia to a distance of nearly 1000 miles, in fact to within 50 miles of Celebes, perhaps to the south-western extremity of that island also ; but there is a space of nearly 30 miles, across which no soundings have been carried. Sumatra, which lies on its western verge, has been subjected to volcanic action, but not to so great an extent as to disturb the direction of its mountain range, which runs parallel to that of the Malay Peninsula. The third and last range that can be traced into the Indian Archipelago is the one that traverses Laos and Camboja, at the southern extremity of which it disappears for a time, showing itself only at Pulo Condor and Natunas, until it emerges near the north-west extreme of Borneo, and is continued along the entire west coast of that island. Here it again disappears, and only shows itself again on the north-coast of Java, where it ceases entirely ; the remaining portion of this island, with, perhaps, a part of the north-west extremity being either of volcanic formation or of alluvial deposit. The celebrated teak-tree which abounds on the Cambojan part of this range, but is not found in Borneo, is again met with here, the projecting part of the north side of Java, between Samarang and Surabaya, being a vast teak forest, from the timber of which the greater portion of the shipping employed in the Archipelago is constructed. Java is the only island in the eastern seas in which the teak-tree is indigenous, nor will it thrive in the volcanic parts of the island where its cultivation has been attempted. This, which we may call the Cambojan Range, is also rich in minerals, especially the Bornean part of it, where large quantities of gold and many diamonds are obtained by the miners. The volcanic islands of the Archipelago also contain metals, gold-dust being found at the bottoms of many of the mountain streams, but it does not exist in veins, as in the Malayan Peninsula and on the west coast of Borneo, these having apparently been broken up by the violent convulsions to which these islands have been subjected. The metal is therefore only obtained from the bottoms of the mountain streams, where it has been deposited when the earth in which it had been contained was washed away.

The limits of the volcanic band which crosses the Archipelago are distinctly defined by the active volcanoes with which it is studded. There appears a great volcanic stream in the neighbourhood of Kamtschatka, from which it can be traced in a south-west direction through the Kurile Islands, Japan, and Loo-Choo, skirting the coast of Asia, to Formosa, where it meets another coming from the south and south-west through the Philippines and Mindanao to the Moluccas, embracing the eastern extreme of Celebes and the western peninsula of New Guinea, and then another curve from the westward along the Trans-Javan Chain to the Strait of Sunda, when it meets that one which comes from a north-westerly direction through Cheduba island, in the northern part of the Bay of Bengal through the Andamans and Sumatra. From the western extreme of New Guinea, however, along the north coast of that island to New Britain, although its volcanic character has been decided by recent French navigators, there remains a tract, including thirteen degrees of longitude, in which no active volcano has been seen. Indeed, it is by no means improbable that the band which takes a southerly direction from Japan through Fatzima, the Bonin and Mariana Islands, may prove to be continued to New Ireland ; in which case the chain of active volcanoes which extends through the Solomon Islands, and the New Hebrides to New Zealand, and perhaps further to the south, may indicate the course of an independent stream.

The Eastern Archipelago from the Nicobars by the Malay Peninsula to the east, is 4,000 miles long from east to west, and 1,300 broad from north to south. The volcanic belt of the Archipelago is marked by a chain of active and extinct volcanoes through the whole length of Sumatra and Java, and thence by the islands of Bali, Lombok, Sumbawa, Flores, the Servatty islands, Banda, Amboyna, Batchian, Makian, Tidore, Ternate and Gilolo to Morty island. Here the belt is broken and shifted 200 miles to the west, to north Celebes, from which it passes on to Siau and Sanguir, to the Philippine islands, along the eastern side of which it continues in a curving line to their northern extremity. From the extreme eastern bend of this belt at Banda, for 1,000 miles, to the N. E. coast of New Guinea, is a non-volcanic district. But there, on the N. E coast of New Guinea, another volcanic belt can be traced through New Britain, New Ireland, and the Solomon islands to the farthest eastern limits of the Archipelago. The united length of these volcanic belts is 90 degrees, their width about 50 miles, but, for about two hundred miles on either side of them, evidences of subterranean action are to be seen in recently elevated coral rock or in the barrier coral reefs which indicate recent submergence. In some part or other of all the line, earthquakes are felt every few weeks or months, varying from a slight tremor to great movements, shaking down villages and destroying life and property, and some of them devastating the adjacent lands. Java has nearly 45 volcanoes, active or extinct, many of them with volcanic cones, and averaging 10,000 feet high. In Java, in 1772, the volcano of Papan-dayang was blown up by repeated explosions and a large lake left in its place. In Sumbawa in 1815, 12,000 people were destroyed by the great eruption of Tomboro. Makian, an island of the Moluccas, was rent open in 1646, by a violent eruption. On the 29th December, 1862, it again suddenly burst forth, blowing up and altering its face and destroying the greater part of the inhabitants and sending forth such quantities of ashes as to darken the air at Ternate forty miles off and destroying almost the entire crops of that and neighbouring islands.

Sumatra, in reference to its extent, has few volcanoes, and a considerable portion has probably a non-volcanic origin. Sumatra, the uncultivated parts of Java and Celebes, Borneo, the Philippines and New Guinea are all forest countries, but on Timor and on all the islands around it, there is absolutely no forest, and this character extends to Flores, Sumbawa, Lombok and Bali.

Mr. George Windsor Earl, in a pamphlet on the Physical Geography of South Eastern Asia and Australia (1855), pointed out that the islands of Sumatra, Java, and Borneo are connected with the Asiatic continent by a shallow sea, and that a similar shallow sea connects New Guinea and all the adjacent islands with Australia, these last being all characterized by the presence of marsupial animals : and, carrying out Mr. Earl's suggestion, Mr. Wallace maintains that some of the islands had long been connected with the Asiatic continent, and others equally long with that of Australia, and that a line of separation can be drawn between them, and he designates the Asiatic portion Indo-Malayan and the Australian division Austro-Malayan. The seas between Sumatra, Java and Borneo are so shallow that ships find anchorage in any part of it, as it rarely exceeds forty fathoms. And the seas eastward to Java rarely exceed one hundred fathoms.

The elephant and tapir of Sumatra and Borneo, the rhinoceros of Sumatra, and the allied species of Java, the wild cattle of Borneo, and the kind long supposed to be peculiar to Java, are now all known to inhabit some part or other of Southern Asia ; and, of the birds and insects, every family and every genus of the groups found in any of the islands occurs also on the Asiatic Continent, and in a great number of cases the species are also identical. The great islands of Java, Sumatra and Borneo, even yet resemble in their natural productions the adjacent parts of the continent almost as much as such widely separated districts could be expected to do, even if they formed part of the Asiatic Continent. The Philippine islands agree in many respects with Asia and the western islands, but present some anomalies.

The eastern portion, on the other hand, from Celebes and Lombok eastward, exhibit as close a resemblance to Australia and New Guinea, as the western islands do to Asia. Australia has no apes, monkeys, cats, tigers, wolves, bears, hyænas, no deer or antelopes, sheep or oxen, no elephant, horse, squirrel or rabbit. In lieu it has kangaroos, opposums, wambats and the duck-billed palypus. It has no woodpeckers or pheasants, but has in lieu the mound making brush turkeys, honey-suckers, cockatoos, the brush-tongued loris, which are found nowhere else in the globe, and all these peculiarities are found in the islands which form the Austro-Malayan division of the Archipelago. The islands eastward from Java and Borneo form a part of a previous Australian or Pacific Continent, although some of them may never have actually been joined to it.

The Aru islands, Mysol, Waigyou and Jobie agree with New Guinea in their species of mammalia and birds, and they are all united to New Guinea by a narrow sea. The 100 fathom line around New Guinea marks the range of the paradise birds.

This separation has no relation to their geological character. The Indo-Malayan and Austro-Malayan divisions hold two distinct types of the human race, the Malay and the Papuan, who differ radically in their physical, mental and moral characters, and under one or other of these two forms, as types, the whole of the people of the Eastern Archipelago and Polynesia can be classed; and the line separating these two types comes near but somewhat eastward of that part of the zoological regions.

This easterly jutting of the Malay line has been caused by the maritime enterprise and higher civilization of the Malay races, who have overrun the nearer part of the Austro-Malayan region, and have supplanted the original inhabitants and spread much of their language, their domestic inhabitants and their customs far over the Pacific. To the Malay type and to the Papuan type, respectively, all the people of the various islands can be grouped. The Asiatic races include the Indo-Malay and all have a continental origin, while the Pacific races, including all to the east of the Malay (except perhaps some in the northern Pacific) are derived not from any existing continent; but from lands that now exist or have recently existed in the Pacific Ocean.

The volcanoes of Java are in two lines, one commencing near Cape St. Nicholas, its N. W. extremity passes diagonally across the island to its south east headland on the Strait of Bali. The other line runs parallel, and extends from Cheribon on the sea coast to the Strait of Sunda. The volcanoes are in two separate fissures in the earth's crust, and the volcanoes in it are cones of elevation, each distinct and separate, their number being 38, and some of them of immense size. They throw out volcanic ashes, sand and scoriæ, and sometimes trachytic lava. White clouds of sulphuric acid gas continually wreath their peaks and are destructive to life. Large quantities of sulphur are dug out.—*Bikmore.*

A severe earthquake was experienced in Batavia, and over an extensive region in Java on the 16th of November 1847. In the Courant of the 27th October 1847, it was mentioned that a shower of ashes had fallen at Buitenzorg on the night of the 17th, which came from the Guntur mountain, in the district of Limbangan, residency of Preangar. On Sunday the 17th October, at 11 o'clock P. M., the earthquake shocks, following each other in quick succession, were felt at Tijandjur, the first of which was very strong, and lasted for fully ten seconds. The shower of ashes began to fall the same night, and on the following morning had already clothed the earth, grass, trees, and buildings with a brown covering. The fall of ashes and sand lasted the whole day, and made it very inconvenient to be in the open air. The eyes of travellers suffered. The earthquakes had not wholly stopped at Tijandjur on the 29th October. The mountain had, however, fortunately begun to be at rest, and no damage had been caused by the eruption. The shower of ashes had reached as far as the frontiers of the residency of Bantam, a distance of more than 80 miles to the west.

The Tenger mountains of Java, mean the wide or spacious mountains. There is here an old volcano with its trachyte crater 7500 feet above the sea, in diameter 3½ and 4½ miles. It is the largest crater in Java, and one of the largest in the world. Its bottom is a level floor of sand, which in some places is drifted by the wind like the sea, and is called by the Malays the Laut Pasar or Sandy Sea. Four cones of elevation rise from this sand floor, the smallest of which, called Bromo, in 1866 was active, throwing out ashes. It rises like Monte Somma in the crater of Vesuvius. But trachyte, obsidian and pumice have been thrown out in succession.—(*Bikmore* 74.)

Papandayang, another volcano in the island of Java, in 1772, in a single night, threw out scoriæ and ashes, which Dr. Junghuhn thinks made a layer 50 feet thick for seven miles around. In Dr. Horsfield's account of it, drawn up from the native testimony, it is stated that an extent of ground of the mountains and its environs 15 miles long and full 6 broad, was by this commotion swallowed up within the bowels of the earth ; but this sinking, according to Professor Bikmore (p. 75), does not seem to have occurred.

Mount Galung-gong, a few miles north-east of Papandayang, is also a Java volcano. On the 8th July 1822, at noon, not a cloud was seen in the sky, when suddenly at half-past one a frightful thundering was heard in the earth, and from the top of this old volcano a dark dense mass was seen rising higher and higher into the air, and spreading itself out over the clear sky with such an appalling rapidity that in a few moments the whole landscape was shrouded in the darkness of night. Through this darkness flashes of lightning gleamed in a hundred lines, and many natives were struck down by falling stones. Then a deluge of hot water and flowing mud rose over the rim of the old crater and poured down the mountain side, sweeping away trees and beasts, and human bodies. At the same moment, stones and ashes and sand were projected high into the air, and as they fell destroyed nearly every thing within a radius of more than 20 miles. A few villages being built on eminences on the lower declivities of the mountains, escaped as they were above the streams of hot water and mud, and the stones thrown out fell beyond them, destroying villages at a greater distance. By 4 P. M. the extreme violence of the eruption had passed; by sunset the sky was again clear and the sun shining on a scene of desolation. A second eruption occurred five days afterwards, and by that time more than 20,000 persons had perished. Tenger mountains are occupied by a peculiar people who speak a dialect of Javanese, and despite the zealous efforts of the mahomedans, they still follow the hindu religion.—(*Bikmore, pp.* 75, 76.)

Volcanoes in Java are usually bare of foliage alike on their summits as on their base, owing to the large quantities of sulphur that are washed down their sides. (*Bikmore, p.* 87.) Mount Slamat Peak is 11,330 feet above the sea, and is an active volcano; it is next to the highest in the island. Ungarung Peak is about 5,000 feet. The north coast of Java is low. Further inland from Ungarung are Mount Prabu, Mount Sumbing, and Mount Sindoro. At Boro-Boro hill in Java, which is terraced, is a buddhist temple built A. D. 1334, and many buddhist images remain, and at Brambanan are 296 hindu temples, erected A. D. 1266-1296. The Telaga-bodas,

White Lake, in Java, is the old crater of the volcano of Papandayang. Java coast towards the south is bold, and its rocks consist of hard volcanic basalts and trachytes.—(*Bikmore,* 79.)

The volcano of Tael is in the island of Luconia in Manilla. The island is formed by a mountain from three hundred and fifty to four hundred yards above the level of the Laguna de Bombon, is about three leagues in circumference and has a crater about two miles at its circumference on its summit. The lining walls of the interior are fifty to seventy-five yards in perpendicular height, and five cones of eruption covered with sulphur rise from the centre of the crater, a lake of green water which boils in several places. The Laguna de Bombon itself has a circumference of thirty leagues; its waters are brackish and bituminous, and of great depth; in some parts no soundings at 125 fathoms. The great eruptions occurred in the years 1716, 1746, and 1754.—(*Elder's Biography of Dr. Elisha Kent Kane,* 1858.)

North of Batchian is Makian, a volcano of which in 1646 there was an eruption.

North of Makian is Motir, a trachytic cone.—(*Bikmore, p.* 299.)

Gold has been washed for in the island of Batchian ever since 1774.

Makian is an island 50 miles from Ternate, consisting of a single grand volcano. In 1646 there was a violent eruption, which blew up the whole top of the mountain, leaving a truncated jagged summit, and vast gloomy crater valley. It was said to have been as lofty as Tidore before this calamity. On the 29th December 1862, another eruption of this vast mountain took place, in which all the villages and crops were destroyed and many of the inhabitants killed. The sand and ashes fell so far that crops 50 miles off at Ternate were destroyed, and it was so dark at Ternate that lamps had to be lighted at noon.—(*Wall,* 9.)

Ternate is merely a high volcano, with its base beneath the ocean. Its circumference around its shore is six miles and its height is 5,400 feet. Severe and destructive eruptions took place in 1608, 1635, 1653, 1673, and next on the 26th February 1838, then on the 25th March 1839, and on 2nd February 1840. In that of 1673, a considerable quantity of ashes was carried to Amboyna. In that of 2nd February 1840, for fifteen hours, the solid ground rolled like the sea, but the heaviest ground wave was at 10 A. M. of the 15th February, and the people then took to their boats. In this interval were great eruptions of ashes and hot stones which fell like hail. Lava poured from the crater into the sea. For ten days clouds of black smoke poured out. About midnight of the 14th, the shocks were more violent, and before half past three A. M. every house was levelled. Fissures formed in the earth, out of which hot water rose for a moment, and then the earth closed again to re-open at another place, nearly every house was destroyed. Its population in 1865 was 9,000. The lower part of the mountain behind the town is covered with fruit trees, and hundreds of men, women and children go daily to the mountain to bring in the fruit, durian mango, lansat and mangustin. When Drake visited Ternate in A. D. 1579, the Portuguese had been driven out of the island by the sultan. Ternate with Batchian constitutes the ancient Moluccas. The people are of three well marked races, the Ternate Malay, the Orang Sirani and the Dutch. The first are the descendants of the intruding Malay who drove out the indigenes (who were no doubt the same as those of the adjacent mainland of Gillolo) and established a monarchy; their language is quite unintelligible. The Sirani are the Christian descendants of Portuguese. Ternate town is at the foot of the mountains. Ternate, Tidore, Motir and Makian are only cones standing on the same great fissure of the earth.—*Bikmore,* 306-312. *Wallace,* i. 300, 311.

Goram is a group of three islands in the East Archipelago. S. E. of Goram is a high group composed of raised coral reefs 300 or 400 feet, with a volcano on the island of Teor which broke forth in 1659. In the Goram group, at Manowolko, east of Ceram, a slight infusion of Papuan on a mixture of Malay and Bugi, has produced a good looking people. The Goram people are wholly traders, every year they visit the Tenimber, Ke and Aru islands, the whole N. W. coast of N. Guinea, from Oetanata to Salwatty and the islands of Waigiou and Mysol. They also extend their voyages to Tidore, Ternate, Banda and Amboyna. Their prahu are all built by the Ke islanders, who annually turn out hundreds of neat boats. The Goram people trade in tripang, medicinal Mussoi bark, wild nutmegs and tortoise shell, which they sell to the Bugi traders at Ceram Laut and Aru.—*Bikmore*, 243. *Wall*. ii. 53, 60. *Mr. Piddington on the subject of Eruptions in Bengal Asiatic Soc. VOLKAMERIA FRAGANS.

Irun, Hind.

A large common shrub with ovate cordate dentate leaves, white fragrant flowers (in the cold weather), terminal panicles.—*Riddell.*

VOLKAMERIA INERMIS. Linn. syn. of Clerodendron inerme, *Gært.*

VOLKAMERIA INFORTUNATA. Roxb. syn. of Clerodendron viscosum, *Vent.*

VOLKAMERIA KÆMPFERII. Willd. Clerodendron squamatum, *Vahl.*

VOLKAMERIA MULTIFLORA. Burm. syn. of Clerodendron phlomoides, *Linn.*

VOLKAMERIA SERRATA. Linn. syn. of Clerodendron serratum, *Blume.*

VOLOGESES, a Parthian king, successor to Gotarzes. Josephus tells us that, on his accession, he made over the province of Media (which, of course, would include Khorasan and as much of Ariana as belonged at that time to Parthia,) to his younger brother Pakores and Armenia to Tiridates, a younger brother. The Vologeses of the Greeks is however supposed by Lassen to be the Abagasus or Abalgasius, one of the Greek successors to Alexander in Arian Abakhafasa, A. D. 70 or 80. See Abagasus, Greeks of Asia, Kabul.

VOLUTA, a genus of molluscs of the family Volutidæ.

Genera. Voluta. Volute. *rec.* 70 sp. *fossil*, 80 sp.
Sub-genera. Volutilithes. *rec.* 1 sp. also *fossil.*
Scaphella. *rec.* and *fossil.*
Melo. *rec.* 8. sp.
Cymba. Boat-shell. *rec* 10 sp.
Mitra. Mitre-shell, *rec.* 350 sp. *fossil*, 90 sp.
Sub-genera. Imbricaria.
Cylindra.
Volvaria. *fossil*, 5 ? sp.
Marginella. *rec.* 90 sp. *fossil.*
Sub-genus. Hyalina. *rec.*

VOLVARIA. See Voluta. Vespertilio.

VOMIT NUT. Eng. syn. of Strychnos nux vomica, *Linn.*

VON HANEN. See Neibuhr.

VONONES, B. C. 100, called Balahara, supposed to have been a Parthian satrap who asserted independence, and created a kingdom for himself out of the dominions of Azilises. See Greeks of Asia, Kabul.

VOOCH. See Khyber, p. 514.

VOODAGA WOOD. A wood of the Northern Circars.

VOODHARUM. See Hindoo.

VOOGHAPALA. Sans. Cynanchum extensum.

VOOPOO-CAREE-NEER-MOOLLEE. Dilivaria ilicifolia.

VORDIKAS. See Brahman.

VORI, or Vuri. Tel. Oryza sativa, *Linn.*

VOROKHTHA. See Kishm Island.

VORUKU GADDI, at Simhachalam, not identified.

VATTE HULLY. Can. A wood of S. Canara.—*Mad. Cat. Ex. of* 1862.

VORKAY, an island of great importance for the pearl fishery lying exposed to the ocean. At a distance of eight miles to the eastward, lie several small islands, between which and Vorkay the trepang banks are situated. At low water, hundreds of men, with their wives and children, may be seen wading from Vorkay towards these isles (the water being only two or three feet deep), carrying a basket at their backs, and having in their hands a stick provided with an iron point. When the water is deeper than this they make use of canoes. For fishing on the banks situated at a greater distance, the Alfoer race use a prahu constructed for the purpose, in which they embark their entire families. These vessels have a very strange appearance. They have agreat beam,andthe stern runs up into a high curve, while two planks project forward from the bows. The family reside in three or four huts composed of atap, or Nipa fruticans leaves, erected within the vessel, and a railing runs entirely round it, apparently to prevent the children from falling over board. The prahu is propelled by a large sail made of rushes, which folds up like a fan (in a similar manner to the sails of a Chinese junk), set upon a tripod mast of bamboos, while it is steered with two rudders. Two other masts are also erected, which answer no purpose but that of displaying several small flags. The pearl fishery is thus carried on. The trader makes an agreement (for the oysters) for so much a hundred, paying in advance a certain quantity of arrack, cloth, &c. When the price is agreed on, the fisher goes to the bank and dives for the oysters, which are mostly small and black, in from twenty-four to thirty feet water, selecting the best he can find. The diving is attended with much difficulty and danger, as, from the time he remains under water, the blood often bursts from the nose and mouth of the diver, while he is also liable to be destroyed by the numerous sharks which are to be found there. In engaging these people, it is necessary to pay off their debts, and, free from this incumbrance, they will readily proceed to any part of the Archipelago.—*Mr. G. W. Earl Indian Archipelago and Papuans.*

VOWS. Luke v. 14. "Offer for thy cleansing, according as Moses commanded." A hindu, after recovering from sickness, presents the offerings he had vowed when in distress; as a goat, or sweetmeats, milk, or any thing directed by the shastras.

VRASH. Hind. Rhus buckiamela.

VRI-HASPATI. The founder of the atheistical school of the hindus. He asserted that the whole of the hindu system is a contrivance of the priesthood to secure a means of livelihood for themselves.

VRIHASPATI, or Varahspati, one of the most common names of the planet Jupiter. Vrihaspiti chacra, the cycle of 60 years, which gives a specific name to all the Solar and Luni solar year. Vrihaspati mana, the year of Jupiter, during which he describes one sign of his orbit. The Telugu astronomers make no difference between this and the common solar year. Vrihaspati, the planet Jupiter, is the guru or priest of the Devas, whom he once deprived of his blessing, in consequence of which they suffered greatly. The word is from vrihat, great, and pati, lord. See Graha, Inscriptions.

VRIHI. Sans. Rice.

VRIJ, the Suraseni of the Greeks. Nothing presents so great a contrast as the poor, slovenly appearance of the Vrij-bashi men, and the delicate features and the brilliantly fair complexion of the Vrij-bashini or ladies of Vrij. Though brought up in poverty and destitution, the women possess a grace and dignity which would warm the coldest heart to admiration. Nearly all that has been said about the Chowbay sect, might apply to the Vrijbashi of the same race, manners, and pursuits. But the Vrij-bashi are a more pastoral people than their richer brotherhood of Muttra. There are about 5,000 Vrij-bashi, out of which 200 families follow the profession of Panda. The Vrij-bashi are dobay—their brethren of Muttra are Chowbay. The principal business of a Panda is to keep a look out for pilgrims. In the midst of the town of Vrij is the handsome tomb of Runjeet Sing, who defended Bhurtpore so bravely against Lord Lake's army. Inside the dome of Runjeet Sing's tomb, the siege of Bhurtpore is represented. Lord Lake is dismounted, and standing before his white horse giving orders to his soldiers. On the opposite side of the dome, Runjeet Sing, in a plain white dress, is standing erect before his idol, at his devotions, with his ministers behind him. On the other two sides he is at his favourite field sports.—*Tr. Hind. vol.* ii. *pp.* 95, 96, 111, 112.

VRIKSHA. Can. Acacia serissa, also Dalbergia latifolia, *W. & A. Roxb.*

VRINDA. Sans. Ocimum sanctum.

VRINDA-VANA. Sans. From vrinda, thick, and vana, a forest, a village on the right bank of the Jumna, the original country of the Yadu,—Bindraban, or Vrindavana, signifying a grove of "Toolsee" trees. It is a holy hindoo town situated on the right bank of the river Jumna, from over which, in a boat, a most picturesque view may be obtained of it, presenting a panorama of great beauty. The circumstance which imparts most to the sacredness of Bindraban, is its having been the seat of the early revels of Krishna, the Apollo of the hindoos; Mutra having been his birth place. While many a hindoo Anacreon courts the muses with lays dedicated to this youth, prominent in hindoo mythology, minstrels and maids join in soft strains to his praise. Bindraban, among other things, is now noted for the manufacture of pretty toys made of a composition that may be mistaken for a mineral. Indeed the vendors pass them off as such, and to enhance their value declare that they are brought from Jeypoor, where articles of this description and marble toys especially receive a fine finish. The Valabba Charya sect of the vaishnava hindu have many hundreds of their temples at Mathura and Bindraban. At Benares and Bindraban, the annual dances constituting the Ras-Yatra, in commemoration of Krishna and the sixteen Gopi, are performed with much display.—*Tour of India by French, p.* 214. See Rad'ha, Vallabhi, Ras Yatra, Rudra Sampradayi.

VRISHA. See Nandi, Vrishala.

VRISHALA. Sans. In the hindu religion, a bad man who slays a bull. Nandi is the sacred bull of Mahadeva, or Siva: it is his vahan, and by some described as the emblem of justice. In the institutes of Menu, c. 8, v. 16, the divine form of justice is represented as Vrisha, or a bull; and the gods consider him who violates justice as a Vrishala, or one who slays a bull. Nandi is the epithet always given to the vehicle of Siva; and it may be applied also to the vehicles of other deities. We sometimes find it used in speaking of Garuda, the vehicle of Vishnu, and of the goose or swan, Hanasa, the vahan of Brahma.—*Moor.* See Chandragupta, Nandi, Siva.

VRITRA, otherwise called Ahi, in hindu mythology, the personification of the rain-cloud; with whom Indra, the lord of thunder, had a contest.—*Thomas' Prinsep's Antiquities.* See Vedas.

VRUKCHUM. Sans. See Tree.

VRUTES are unconditional vows to perform certain religious ceremonies, Mununu is a conditional vow, promising to present offerings on condition that the god bestow such or such a benefit.—*Ward's View of the Hindoos, vol.* ii. *p.* 75. See Vows.

VUCCA. Tam. a thick rope made of the Crotalaria juncea fibre, for dragging timber, made in Travancore.—*Simmond's Dict.*

VUCKANA MARAM. Tam. Diospyros cordifolia.

VUCKU-NAR. Tam.? Mal.? Crotalaria juncea.

VUDA GADDI, or Udagadi. Tel. Panicum flavidum. *Retz.*

VUDAH. Arab. Ficus religiosa.

VUDAM. Tel. Terminalia catappa, *Linn.*

VUDAM VITTULU. Terminalia catappa, *L. R.* ii. 430. *Rheede.* iv. 3.

VUDAPA ALLAM. Tel. Poa bifaria, *Roxb.*

VUDAPA CHETTU, or Gatrinta. Tel. Hugonia mystax, *Linn.*

VUDATA CHETTU, or Balikomma. Opilia tomentacea, *Roxb.*

VUDA TALLAM. Poa bifaria, *R.* i. 331.

VUDATA TOKA GADDI. Lit. Squirrel's tail grass. Eleusine calycina, *Roxb.*

VUDDAMBA. A Travancore wood of a brown colour, specific gravity 0·750, used in building common houses.—*Colonel Frith.*

VUDGE. Pers.? Sweet Flag, properly Vaj or Vuj.

VUDYA, or Vudza. Tel. Acorus calamus aromaticus. Sweet Flag.

VUGEPALA. Sans. Cynanchum extensum.

VUGEN. Dut. Figs.

VUJ. Pers. Acorus calamus aromaticus, *Linn.*

VUJRAKANTAKA. Sans. Euphorbium.

VUKKA. Tel. Nut of Areca catechu, Betel nut.

VUKKU-NAR. Tam. Fibre of Crotalaria juncea, *Linn.*

VUL-VAYLUM, or Vel-vaylum. Tam. Acacia ferruginea.

VULA. Tel. Cadaba Indica, *Lam.*

VUL-ADAMBU. Tam. Calonyction grandiflorum, *Choisy.*

VULA-MARAM. Tam. Feronia elephantum.

VULA POLUMORINIKA. Tel. Cadaba Indica, *Lam.*; *W. and A.*

VULCAN. See Saraswati, Kartikeya, Yavana, Viswakarma; the last named is the Vulcan of the hindus.

VULISI. Tel. Guizotia oleifera, *D.C.*

VULLA, properly Velli pundu. Tam. Garlic.

VULLAK, properly Vilak yennai. Tam. Ricinus communis. Lamp oil.

VULLAR, a lake of Kashmir, from which the Jhelum issues.

VULLAR, or Vullai tutam. Tam. White copperas, Sulphate of zinc.

VULLARI, or Vullari kire. Tam. Hydrocotyle Asiatica, *Linn.*

VULLAY, or Vellai kungillam. Tam. Dammer.

VULLAY NAWEL PALLAM. Tam. Calyptranthes caryophyllifolia.

VULLAY PASHANAM. Tam. Arsenic.

VULLAY KALANGU. TAM. Batatas edulis.

VULLERI-KAI. TAM. Cucumis sativus.

VULLERI VIRAI. TAM. Seeds of Cucumis sativus.

VULLI KEERAY. TAM. Convolvulus repens, *Linn.*

VULLI GADDA. TEL. Allum cepa, *Linn.*

VULLI KANIRAM. MALEAL. Cocculus acuminatus, *D.C.*

VULOCAL, or Vulvaylum maram. TAM. A strong wood of Ceylon which is used by the natives in making farming utensils. It grows to twenty inches in diameter, and twelve feet in height. The bark of this tree, with the Maradum bark and ginger, is used by the natives for cleaning and preserving the teeth.—*Edye, Ceylon.*

VULPES. the Fox.

Taaleb,	AR.	Nomri,	HIND.
Shual,	HEB.	Kokri,	MAHR.
Lomri,	HIND.	Robur of	CANDAHAR.

In India, three foxes are met with, and may be noticed separately :

Vulpes Bengalensis. *Shaw.*

Canis Bengalensis,	*Gray.*	V. corsac,	*Gray.*
,, kokree,	*Sykes.*	V. Bengalensis.	,,
,, rufescens,	*Gray.*	V. Indicus et Kokree,	*Blyth.*
Vulpes Indicus,	*Gray.*		
Lomri, Loomri,	DUK.	Bengal fox,	ENG.
Noomri,	,,	Common fox,	,,
Bengal dog,	ENG.		

Lives in the entire of India and the adjacent countries, but varies both in size and colour in different localities ; generally of a greyish brown with a fulvous cast, passing in some cases to Isabella : it is always variegated above with the intermixture of whitish hairs. It is a very pretty animal, but much smaller than the European fox, with a short head, very sharp muzzle, oblique eyes, nut-brown irides, very slender legs and very bushy tail trailing on the ground. Its principal food is rats, land crabs, grasshoppers, beetles, and fruit, the mango and custard apple are largely eaten. It always burrows in open plains, runs with great speed, doubling like a hare ; but instead of stretching out at first like the hare, and trusting to its turns as a last resource, the fox turns more at first, and if it can fatigue the dogs it then goes straight away.

Vulpes flavescens. *Gray.* Silver Fox.

Vulpes montanus,	*Hodg.*	Bobur of	CANDAHAR.

This species is numerous in the valleys around Candahar, hiding in burrows and holes in the rock. It is about two feet long from the nose to the insertion of the tail, and the tail is about seventeen inches, height at shoulder about fifteen inches. Its tail is yellowish, back rather darker inclining to brown, face and outer side of fore legs and base of the tail pale fulvous, spot on the side of the face just before the eyes, the chin (breast), the front of the fore legs, a round spot on the upper part of the hind foot, and the tips of the hairs of the tail blackish, end of tail white and ears externally bladic. The skins are soft and are made into the reemchah and posteen. One night, says Adams, we were disturbed by the barking of a fox, and at daybreak on the following morning, I shot a female and cub of the silver fox, Vulpes flavescens, both within a few yards of my resting place, where thay had been devouring the refuse of my previous night's dinner.

Vulpes montanus. *Pearson.* Hill Fox.

Canis vulpes montanus,	*Pears.*	Vulpes nepalensis,	*Gray.*
,, himalaicus,	*Ogilby.*	Mountain Fox	*Eng.*
Vulpes montanus,	*Gray.*	Hill ,,	,,
		Red ,,	,,

The hill fox of India dwells in the Himalaya, ranging up to the snow limit ; and in winter, when the snow is on the ground, they are very numerous about Simla, coming close to the houses in search of offal. Its fur is exceedingly rich, dense and fine, the longer sort measuring fully two inches upon the back and the inner every where of considerable length and woolly character. General color pale fulvous, head mixed with white, tail bushy and white tipped. V. montanus was not seen by Dr. Adams beyond the wooded regions of Cashmere, and is evidently replaced by the silver fox, V. flavescens, which is not however partial to the barren regions of Ladak, but is also to be met with on the tops of the southern Punjab. Vulpes montanus is generally distributed over the lower and middle regions of the Himalaya, up even to the limits of frost. Although often seen during the day, its depredations are chiefly at night, when it prowls about houses after poultry ; and in the jungles, when it preys on kalij pheasants and other birds. This handsome species is readily recognised by the rufous on the back and pale fulvous on the legs.—*Adams. Jerdon. Horsburg.*

VULR. HIND. Verbascum thapsus.

VULTURE.

FAMILY Vulturidæ.

Sub-Fam. Vulturinæ, 2 gen. 2 sp. viz., 1 Vultur ; 1 Otogypscalvus.

Sub-Fam. Gypinæ, 1 gen. 3 sp. viz., 3 Gyps.

Sub-Fam. Sarcorhamphinæ, 2 gen. 2 sp. viz., 1 Sarcorhamphus : 1 Neophron percnopterus.

Sub-Fam. Gypætinæ, 1 gen. 1 sp. viz., 1 Gypætos barbatus.

The Egyptian vulture is a native of eastern Europe, Asia, and Africa. On the temperate regions of the Himalaya it follows man wherever he congregates ; and on the plains of India its gaunt forbidding figure is seen stalking among all animal refuse. It is the smallest of the tribe found in the East ; its total length seldom exceeding 26 inches. The vulture and crane, which soar high in the heavens, are sometimes called garuda, and geed. Vultur monachus has been met with at Umballa. One shot there in 1866, weighed lbs. 17, and was 8 feet 2 in wing measurement.

VULULUVI. Tam. Celastrus paniculatus.

VUL-VAYLUM. Acacia ferruginea.

VUM-MAAI. Tam. Chloroxylon swietenia, *Roxb. W. & A. DC.*, also Vum-madi. Tam. Chloroxylon swietenia, *DC.*

VUM-PARATI. Gossypium herbaceum.

VUNGALA-PATCHEI. Tam. Verdigris.

VUNI. Tel. Acacia ferruginea, *DC.*

VUNKI. Tam. An article of jewellery.

VUNNY —? Prosopis spicigera.

VUNU-DEVI. Sans. From vana, a forest, and devi, a goddess.

VUPANAYANAM. See Upanayanam, Hindoo.

VURAITCH. See Jat.

VURKI-ZUKKUM. Arab. Euphorbia netilfolia, *Linn.*

VURNU-SUNKURU. Sans, from varna, caste or profession, and sankara, mixed.

VURTULI. Hind. Dichrostachys cinerea, *W. & A.*

VUSALAI KIRAI. Tam. Spinacea oleracea.

VUSHIRA. Sans. Potentilla officinalis.

VUTTA-KELOO-KELOOPAY. Crotalaria verrucosa.

VUTTA TAMARE. Tam. Macaranga Indici, *R. W.* A simple pure gum of a crimson colour from Travancore is obtained from this tree, it has been used for taking impressions of leaves, coins, medallions, &c. When the gum is pure and carefully prepared, the impressions are as sharp as those of sulphur, without its brittleness, the exudation so far as known is an entirely unknown production.—*M. E. of* 1857.

VUTTI-KHILLO-KILLUPI. Tam. Crotalaria verrucosa, *Linn.*

VUTTOM. In Southern India, pieces of cast steel, as they come from the crucible.

VUTTY MARITHY. Tam. A Travancore wood of a brown colour, specific gravity 0·595, used in building common houses.—*Colonel Frith.*

VWI—? Dioscorea, species.

VWIR. Hind. Salix alba.

VYA-KARANA. Sans. In Sanskrit, grammar is called vyakarana, which means analysis or taking to pieces.—*Muller's Lectures,* p. 107.

VYAMBU, or Vashampu, or Wussumbu. Mal. Acorus calamus aromaticus.

VYANA. Mal. Cinnamomum iners.

VYAN MATA. The kula-devi, or tutelary goddess of the house of Esupgol of Bunderdeva, whose daughter married Bappa.

VYASA, son of Satyavati, his specific name was Krishna Dvaipayana.

VYASA. Son of a rishi by the daughter of a fisherman, author of the Mahabharata, and arranged the Vedas. The Vedanta of Vyasa considered all existing beings and things to be an evolution of the deity in and throughout all beings and things. Sankaracharya went further and declared that the soul of man is a part of the deity, not different, but confined in the body as a temporary prison, and on the death of the body flowing back to the deity. Vyasa, the author of the Mahabarata, was son of Santana, of the race of Heri, sovereign of Delhi, but by Yojnaganda, a fisherman's daughter, consequently illegitimate; he became the spiritual father, or preceptor, of his nieces, the daughters of Vichitravira, the son and successor of Santana. Vichitravira had no male offspring. Of his three daughters, one was named Pandea; and Vyasa, being the sole remaining male branch of the house of Santana, took his niece, and spiritual daughter, Pandea, to wife, and became the father of Pandu, afterwards sovereign of Indraprestha. Arrian gives the story thus. He (Hercules) had a daughter when he was advanced in years, and being unable to find a husband worthy of her, he married her himself, that he might supply the throne of India with monarchs. Her name was Pandea, and he caused the whole province in which she was born to receive its name from her. Vyasa is reputed to have arranged the Vedas as they now are. In the Vishnu Purana is a list of 28 Vyasa. In Sanscrit, Vyasa means distributor, in this, Vyasa is kindred to the Greek Homeros, ἁμ and ἀρ.—*Tod's Rajasthan, vol.* i. *p.* 30. *Rev. William Taylor.* See Inscriptions, Nyaya, Pandu, Polyandry, Vidya, Advaitam, Veda, Vyasa.

VYASA'S SUTRA. See Vallabha Acharya.

VYAS RISHI, a sacred pool at the Rotang pass, the source of the Beas river. Vyas Rishi pool is 13,000 feet above the sea. Endrasa is at the site of the confluence of the Beas and Sutlej rivers.

VYGAH, a river in Madura, lat. 10° 17′ lon. 71° 37′ runs S. E. into the Bay of Bengal, after a length of 130 miles. The large anicuts upon it are Conoor, diverting a stream of same name, Parea, Anai, and Chittanaik.

VYGEN. Dut. Figs.

VYHRITIS. Sans. These are the mysterious words Bhur, Bhuva and Swaha. See Gaitri. Hindu.

VYLEN. Dut. File.

VYUHA. See Sri Sampradaya.

W, the twenty-third letter of the English alphabet, takes its shape from a repetition of the letter v. Most of the modern languages of Europe do not have the letter w. In the English language it is a consonant when at the beginning of words and syllables, as wail, forward; but is a vowel when at the end of words, as in new, row. Many races have a difficulty in pronouncing the consonantal w, and others interchange it with the letter v. In all the dialects and tongues of the East Indies, there is a perpetual tendency to interchange the sounds of v and w, or to substitute the latter entirely. The mis-use of these two sounds is, in India, like that of London. In Tamil, this often occurs, so that varam becomes waram, and in the Persian wao, used in Hindustani words derived from the Arabic, it has the sound of v and w, as vakil, wakil; vazir, wazir. In Mahrati, for the same letter, are the two sounds of wau and vau, the latter especially occurring when before i or e, or when combined with ri or r. In Malayalam it has usually the sound of v, but in composition that of w, as in swarga. In Guzerati, the uneducated people pronounce the sound as w the educated as v.

WA. Burm.

Wass,	Singh.	Varsh or Warsh,	Sans.
Barish,	Hind.		

Wa is the three months of the Burmese rainy season. During these three months the wandering buddhist mendicants were enjoined to remain in a fixed habitation. The monks are expected during this season to be doubly particular in abstraction from secular affairs, in abstinence and meditation: it is the great season for preaching to the laity.—*Yule, p.* 120.

WA. Burm. Mouth of a river.

WA. See Myen-mo.

WA. Burm. Amorphophallus campanulatus, *Bl.*

WA. Burm. Bambusa arundinacea, *Roxb.* The bamboo.

WA. Burm. Gossypium Indicum, *Lam.* Gossypium herbaceum, *Linn.* Native cotton.

WA-BO. Burm. Bambusa gigantea, *Wall.*

WACHES. Ger. Wax.

WACHOLDER-BEEREN. Ger. Juniper berries.

WACHOLI. Hind. of Bunnoo, same as Barani, or rain irrigated land.

WACSH. Dut. Wax.

WADA-GALLAI, a sect amongst the Tamil sudra, commonly known as the right-hand caste, to distinguish them from the Ten-gallai, or the left-hand caste. The literal meaning of these words are northern sect and southern sect, but the points of difference are very obscure. See Left Hand Castes, Right Hand Castes, Tengalai.

WADALEE. Singh. Inspissated juice of Acacia catechu.—*Sim. Dict.*

WADANG, or "Bayur," a light and tolerably durable wood of Java, employed for masts and spars of small vessels; but the surface must be covered with resinous substances to prevent it splitting.

WADARA, or Waddar, the Wadara wanloo of the Tiling people, are to be seen all through the Hyderabad dominions. They are migratory, dwell in little huts of reed or fine grass, and move to any place where they can find employment. They are spread across the peninsula of India from the valley of the Nerbudda to the south, all speaking Telugu. They are road-makers, tank-diggers, and labourers. The men and women vary greatly in size, though some of the men are stout and athletic. They all drink heavily. Wadaru have two castes, one of them earth diggers who eat rats, the other quarriers and stone-cutters.

WADDA-KAHA. Sing. Sweet flag, Acorus calamus, *Linn.*

WADERS, an order of birds known to naturalists as the Grallatores. In India the small waders are particularly common, including most of those found in Britain, in greater or less abundance.

WADIAR, Waddiwara, the Waddara race speaking Telugu, who are road-makers, tank diggers. See Wadara.

WADI-ARABAH. The valley connecting the Gulf of Akaba with Palestine, is in length 105 miles, its summit level is 495 feet, and Dead Sea extremity 1446 feet below the Mediterranean.—*Petterman in Lond. Geo. Trans.* 1848, *vol.* xviii. 89. *Dr. Buist's Catalogue.*

WADI BUTI. Hind. See Ajuga bracteata.

WADI TOR, or Bell Mountain in the peninsula of Mount Sinai. During certain states of the wind, its sands, when put in motion, give out sounds like a bell. A similar mountain occurs near Cabool, described by Burnes in Bl. As. Trans. 1838, as Reg Rawan or Moving Sand.—*Newbold in Lond. As. Trans. vol.* vii. *p.* 78. *Dr. Buist's Catalogue.*

WADI ZEBID. Arab. See Ficus religiosa?

WADURANEA. Singh. A carpenter's measure, composed of 24 angula, which is divided into four parts. The angula is equal in length to a grain of rice.—*Simmond's Dict.*

WAE KOOMBHA. Mahr. Careya arborea, *Roxb.*

WÆLA. Singh. Artocarpus integrifolia, *Linn.*

WAEL-KOLUNDU. Singh. Wormwood.

WAFKAN. Bokhara town is in L. 39° 27′ N., L. 80° 19′. It is surrounded by a desert, but is watered by the little river Wafkan, which flows between forests of fruit trees and gardens.

WAGA. Acacia odoratissima.

WAGHER, a race who occupy Dwarika. They and the Badhail were long the terror of the neighbouring seas. See Badhail, Dwaraka, India, Kattyawar, Jhareja, Kutch.

WAGHERI, a race of hunters in western India, considered outcasts from society. Hindoos regard their flesh-devouring propensities with horror, and mohamedans, however poor, loath the men who track the wild boar to his reedy bed, and voraciously devour his unclean carcass. The Wagheri has a bright, restless eye, and a wild and independent bearing; the expression of his features is strongly marked, evidencing the existence of more powerful passions in the individual than is common to the general character of the hindoo races. European sportsmen frequently retain them at a hunting establishment, and habit has enabled these Wagheri to trace the wild boar and other large game. In character, the Wagheri is daring and revengeful, ready to commit any act of violence for reward.—*Postan's Western India, vol. I., p.* 203-4.

WAGHIA, also Wagoba, the tiger deity worshipped by the Bhil and Naikude Gond races, and under the name of Bag Deo, by the Kurku. Waghia is worshipped by the Bhil in the form of a rude stone, at the edge of a forest or jungle, and sometimes in the form of a tiger. A recent writer says he overhead two village Bhil, Gopaji and Devaji by name, reviling their idol at the edge of the jungle in round terms. "You fellow!" cried Gopaji, "I gave you pulse and broth, and a chicken, yet you killed my buffalo!" "Broth and a chicken!" screamed Devaji; "I gave you three chickens and a goat, yet you carried off my child! What more do you want, you rascal?" The forest races of the Spondoor valley style the tiger their brother, and allege that their brother never hurts them.

WAGHORN, a Lieutenant of the Royal Navy, the first who advocated the Red Sea line for communication with India, and made great efforts to promote its success. He devoted several years of his life to the establishment of overland communication with India. He died 8th January 1850, neglected and in poverty, but his widow was granted a small pension from the Royal Funds.

WAGHUTTI. Mahr. Capparis grandis and Capparis brevispina.

WAGHYZ. Hind. Pusht. Juglans regia. Walnut.

WAG-NAK. Malay. The Bag-nak or Tiger-claw weapon of the Mahrattas, worn on the fingers.

WAG-NA-KHYAT. Burm. Bambusa spinosa, *Roxb.*

WAGTAIL. Several kinds of wagtail occur in India. The gray wagtail is the Motacilla boarula; the lark-toed wagtail, Budytes citreola, occurs in the irrigated fields; the spotted hill-wagtail, Enicurus maculatus, is one of the most handsome denizens of the mountain streams. It is larger than the pied wagtail, and nearly 11 inches in length.—*Adams.* See Birds.

WAGU. Jav. Gnemium gnetum.

WAGUR, the most eastern part of Kutch, inhabited by the Wagila rajputs.

WAH! Amongst mahomedans and Sikhs, an exclamation, used like the English Bravo! Well done! Hear! Hear! Hurrah! The usual war cry of the Sikhs is "Wah! wah! Guru ji ke fattah!" Hurrah for the victory of the guru.—*History of the Sikhs, p.* 143.

WAHABI. Mahomed ibn Abd-el Wahab, a native of the province of Nejd, belonged to the pastoral tribe of Temin. He was born at El-Ayneh in 1691, and from him sprung a sect which assumed the name of Wahabee. The doctrines which they adopted were severe and puritanical. They acknowledged one God, and believed that the Koran was an inspired writing; they also acknowledged Mahomed to be the prophet of God, but deprecated any peculiar homage being paid to him, as they considered him a mortal like themselves, though gifted with a divine mission. These doctrines spread with amazing rapidity through the various tribes of Nejd, and the reformers soon obtained a preponderating influence in the north-east part of Arabia; while by his powerful servant, sheikh Mekrani of Nerjan, Abd-el-Wahab carried his victorious arms into Yemen. On his death he was peaceably succeeded in his temporal and spiritual power by his son Abdool-Azees, during whose reign the doctrines of the new sect were received through the greater part of the peninsula. Mecca and Medina were added to their conquests in 1803 and 1804, the treasuries were plundered, and all the holy tombs, which were an abomination to these reformers, were destroyed. The southern Wahabees began their career in 1834, when Abd-el-Hakal, chief of the Beni Hassen, commenced striving for conquest. The power of the Wahabees continued to increase until 1813, when Mahomed Ali, pasha, took up arms against them and restored the holy cities of Medina and Mecca, to the nominal protection of the Porte, but virtually made himself master of the Hejaz : and during the years 1814-1815, conducted operations with varied success. On his return to Cairo, he sent his son Ibrahim Pasha, and the campaign which followed, characterized by a series of the most barbarous cruelties, resulted in the complete downfall of the Wahabee power, the conquest of Deria, and the capture of Abdulla-ibn-Saood, the Wahabi chief. Ibrahim returned to Cairo, embarking from Jedda for Cossier on the 16th November 1819, but under another leader progress was made in bringing the rulers in Yemen, and particularly the Imam of Senaa, under the yoke of Mahomed Ali. The doctrines of the Wahabi sect spread into India and other mahomedan countries. In India the followers are undoubtedly the most intelligent of the mahomedan races and sects, but the Wahabi are still numerous in northern and eastern Arabia.

Muhammad-ibn Abul-l-Wahhab was not an innovator but a reformer, whose aim was the restoration of islam to its primitive purity and simplicity, by insisting that its fundamental dogma, " there is no deity but God," absolutely forbade all veneration to man, prophet or apostle, living or dead, however highly distinguished by the divine favour. There can be no doubt that beyond this utter exclusion of human merit the formula, as originally proclaimed by Mahomed, implied the doctrine of the absolute sovereignty of God in a sense which reduced all created beings to a mass of unconditional passiveness. Palgrave gives a splendid dissertation on the full import of this symbol of islam. The great Wahhabi appears to have grasped this theory, but it is highly probable that his efforts to explain it only added to its abstruseness, thereby giving some colour to the charge brought against his writings by the orthodox, that they consisted chiefly of " sophisms and speculations." It is equally reasonable to suppose that a very limited number of his disciples were capable of appreciating the more recondite views which his power of abstraction enabled him individually to entertain of the nature and attributes of the supreme being ; less difficult of general comprehension, however, was that part of his system which denounced all honours paid to saints and tombs as heretical innovations, detracting from the worship due solely to the Creator, and therefore to be regarded and dealt with as idolatrous. To say nothing of pagans and christians, whom all mahomedans hold to be polytheists, the doctrine thus revived placed Sunni and Shiah, Ibadhiyah and Rafidhi, alike in the same category, and moreover sanctioned their being dealt with as such, despite their negation of any deity save one by a strict adherence to the orthodox formula. Hence it was that " they legalized the despoiling of the mahomedans, taking their wives in marriage before they are legally divorced from their husbands, and without observing the *Iddh*, and also the enslavement of their children." All these outrages, from the Wahhabi stand point, were solemn duties imposed upon them by their obligations to God and islam, which they could not forego without risking their own salvation. Wahhabeism, in fact, apart from certain speculative notions respecting the supreme being,—in the main perfectly in accordance with the theology of the Koran,—may be defined as a politico-religious confederacy, which legalizes the indiscriminate plunder and thraldom of all peoples beyond its own pale.

Towards the latter part of the 18th century the sect became very numerous, powerful, and fanatical. In 1803 they laid siege to Mecca and Medina and took them, slaughtering all who would not embrace their doctrines. They held these holy cities until the year 1809, when the legions of Eygpt and Turkey were poured in against them. After many sanguinary engagements the Wahabees were defeated, but not exterminated. It was against the political power of this sect that the Indo-British army and navy fought the battles of Ras-ul-Khyma and Beni-bu-Ali in 1819and 1821. This secthas got adherents throughout all India, and some of its members seem early to have organized a conspiracy against the British Government. Mr. William Tayler, in 1857, was the Commissioner of Patna at the very outset of the revolt and he placed the leading moulvies (among whom was the notorious Ahmed-oola) under precautionary surveillance, thereby paralyzing the entire body. Dewan Mowla Buksh, the deputy magistrate, devoted himself to loyal co-operation with him and seven years afterwards received the Star of India. Wilayat Ali Khan, the most influential citizen of Patna, cast in his lot from the very first with the British authorities, and did inestimable service, for which he received neither commendation nor reward. Caze Ramzan Ali and many others behaved well. In the middle of the century, acting from Patna as their head-quarters, the Wahabees engaged for many years in treasonable practices, sending men and arms and treasures beyond the frontiers for the purpose of raising and waging a jehad or religious war against the British. Notwithstanding the events of the mutiny, the Wahabee moulvies or preachers in Patna redoubled their exertions to collect recruits and money for a jehad. Emissaries were sent to all parts of the country to preach and induce ignorant men to join in the undertaking. Thousands of quiet villagers from Lower and Eastern Bengal flocked to Patna, where they were entertained for a few days at Sadikpore and thence sent forward in bands of eight or ten through Umballa to the Mulka Sittana Hills. Then followed the Frontier War in 1863, under Brigadier Chamberlain, which cost the British Government much trouble, no small amount of treasure and many valuable lives, there having fallen in that short campaign 847 European and Native officers and men. Even whilst the war was being waged, the Wahabee moulvies at Patna were sending, in large quantities, gold mohurs and hoondies for the support of the rebels, and although the rebellion was crushed, temporary failure but stimulated them to renewed exertions, openly preaching sedition in every village of the most populous districts, unsettling the minds of the mahomedan population, and obtaining an influence for evil as extraordinary as it was certain. It is one of the leading principles of the Wahabees, that it is their duty whenever the occasion offers to commence a jehad or holy war for the extirpation of all infidels, in which class they regard not only christians, but also mahomedans of other sects. For this purpose they monthly and yearly lay bye part of their incomes; and through their moulvies or teachers they are continually fomenting discords. They are in numbers wherever there is a mahomedan population. Madras, Vellore, Bangalore, and the Mysore country have got their goodly quota. Generally they repudiate the name of Wahabee, but they virtually belong to this powerful mahomedan sect and their itinerating moulvies travel through the country. The influence which these men exert on the sect is extraordinary, whether under the appellation of Wahabee, Ferazi, Hidayeti, Mahomedi or Nya Mussulman, and is evinced by their blind obedience to their moulvies, teachers, and leaders, and the pertinacity with which they adhere to the duty of jehad. Most of the beef-butchers of Hyderabad, Madras and Bangalore are of this sect, and from Madras, as a centre, there is sent out a moulvi and a pesh-imam to itinerate amongst the towns and native regiments. The mahomedans, in so acting, are watching their opportunity. Undoubtedly however, there is great room for reform in the tenets of the mahomedans, all over the world. Contrasting the practice of islam in these days with the pure deism inculcated by the Koran, Sir John Malcolm justly remarks :—"The followers of the prophet of Arabia have relaxed from the principles of their religion, and have granted a species of adoration not only to him and his immediate descendants, but to a number of learned or pious men who have been canonized as saints. The feelings of gratitude and veneration which the conduct of individuals first created have grown by excessive indulgence and by the ardour of passions excited by contrary opinions—into sacred reverence and devotion. Their very garments have become relics of inestimable value; and in the course of time the same properties have been assigned to them as are supposed to have belonged to their possessors." From this common progress of superstition hardly one of the numerous sects into which the mahomedan religion is divided can be deemed exempt. By way of illustration, the author in an appended note refers to the "incredible veneration paid to the early martyrs and confessors by their pious contemporaries" as having been the cause of many evils in the Christian Church. The parallel holds good still.—*History of Persia, vol* ii. *pp.* 377-8. *Niebuhr's Travels, v.* ii. *p.* 131. *Jahan Numa, p.* 523. *Wellsted's Travels, v.* i. *p.* 5. *Burton's Pilgrimage to Meccah, v.* iii. *p.* 272. *Playfair's Aden. Imams* of *Oman by R. G. P. Badger, F. R. G. S. pp.* 63-65. *Palgrave's Central and Eastern Arabia, vol.* i. *pages* 365—373.

WAHLEA. Mahr. Basella alba, *Linn.*

WAHSHA. See Masailma and El Aswad.

WAIBHASHICA. See Vidya.

WAID. Ger. Woad.

WAIGIOU, written also Waigyu, an island between New Guinea and Gilolo, in the Eastern Archipelago, and not far from Gilolo. The island is occupied by a Negro race, with nose flat, the lips thick and projecting, the complexion a dark olive, the eyes deep seated, and on an average, the facial angle 77°, but as high as 81°. In Gebbe or Waigyu and in some parts of the coast of New Guinea, the complexion is lighter, and the peculiar texture of the Negro hair is absent.

The inhabitants of Waigyu Islands, lying between New Guinea and Gilolo, are Negroes. They are described by M. Du Perry, who represents them as having more regular features.

The language spoken at Waigiou is entirely Papuan, being that which is used on all the coasts of Mysol, Salwatty, the N. W. of Guinea, and the islands in the Great Geelvink Bay, Waigiou, Gueüe, Poppa, Obi. Batcheau between New Guinea and the Moluccas as well as the S. and E. peninsulas of Gilolo, possess no original tribes, but are inhabited by people who are evidently mongrels and wanderers. The Waigiou Islanders barter trepang for cotton and woollen stuffs, brought in the Chinese juncs.—*Wallace, vol.* ii. *p.* 216, 217. See India.

WAI KUMBA. MAR. Careya arborea.

WAILLEE WANEE. See Kush or Cush.

WAIN-GANGA. A river which rises in the Seoni district, a few miles to the east of the Nagpur and Jabalpur road, near the Kurai Ghat. For a short distance it flows in a north-westerly direction, then turning to the north, it skirts the west of the Seoni district, and not far to the west of Chhapara, where it is crossed by a fine bridge with twelve arches of fifty feet span, it turns again and flows towards the east down to its junction with the Thanwar. At this point it changes its course to the south, and after passing through a mountain gorge, enters the open country known as the valley of the Wainganga. For about sixty miles it flows nearly due south, forming the boundary between the Seoni and Balaghat district, it is then joined by the Bagh, and flows in a south-westerly direction through the Bhandara district. At the junction of the rivers Wainganga and Wardha commences that mass of rocks which is known as the Third Barrier of the Godavery. The Wainganga is navigable during the rains for about one hundred miles above the junction with the Kanhan. Its greatest breadth is about three hundred yards. Its length to its junction with the Wardha is about three hundred yards.

WAIRAGARH. The eastern pargana of the Brahmapuri tahsil in the Chanda district. It is bounded on the north by the Bhandara and Raipur districts, on the east by the Raipur district and Bastar, on the south by the A'mbgaon pargana and zemindars, and on the west by the Wainganga. Wairagarh is very unhealthy during the autumn and early winter months, and its trade has consequently been almost wholly diverted to the neighbouring town of Armori, but the zemindars of the north and north-east still look upon it as their capital, and many of the surrounding landholders have residences here. Good sandstone and granite are obtained near the town, and mines of diamonds and rubies were formerly worked in the vicinity. The town contains government schools for boys and girls, a district post-office, a police station-house, and the office of a patrol of customs.

WAISH. See Afghani.

WAJEYA. See India.

WAJRI, a race in Okhamundal.

WAK. The supreme being of the Galla race of Shoa. Ateti, the female power of Wak. See Semetic races.

WAKALAH. In Egypt a caravanserai or khan.—*Burton's Pilgrimage to Meccah, vol.* i. *p.* 60.

WAKALU. KARN. TEL. A plural of Wakl or waql, a farmer or agricultural race.

WAKAMBA, a tribe about 70,000 in number on the Eastern Sohaili coast, formerly nomades, but now with some skill as farmers and traders, and have flocks, herds and domestic ornaments. They wear a leather thong round their loins, and allow one end to fall behind like a tail. They have smooth dark skins and slender forms. Their features are not those of the Negro, towards which race they feel a great contempt.

WAKARA. SINGH. Artocarpus integrifolia, *Linn.*

WAKE. TEL. Carissa carandas, *Linn.*

WAKHAN, a hill state north of Badakhshan, its chief lays claim to Grecian origin. Wood mentions a torrent in Wakhan called Zerzamen, probably Zar-zamin, "Gold-ground." He also says all the tributaries of the Oxus are fertile in gold.—*Wood's Oxus* 382. *Yule Cathay,* I. *p.* 236. *Afghanistan.* See Kabul, Kush or Cush, Tibet.

WAKIDI, a biographer of Mahomed, born at Medina, and died aged 78 in Baghdad. A. H. 207 (A. D. 803.) He expended 2000 dinar in buying books and left behind him 600 chests full. His secretary was Ibn Sa'd; and he had two slaves as amanuenses.

WAKKA. TEL. Betel-nut, areca-nut, Penang nut, the nut of Areca catechu.

WAKKOO. MALEAL. TAM. Crotalaria juncea. Wakkoo-nar. TAM. Fibre of Crotalaria juncea, *Linn.*

WA-KU-LA. BURM. Gossypium acuminatum, *Roxb.* Pernambuco cotton.

WALA. HIND. Valeriana Wallichiana.

WALA. In the Ferozepore district, the addition of "Wala" is a common term in naming villages, such as Sultan Khan Wala, Bootawala, Akberwala; and probably the name of Ferozshahr may have been Ferozshahwala, and from the length of the word the latter part may have been dropped or shahar (a city) substituted.—*History of the Sikhs, p.* 54.

WALA-JAH. PERS. the title granted by the mogul emperors of Delhi to Mahomed Ali, nabob of the Carnatic, and the family are styled Walajahi.

WAL-AHATTOO. Singh. Ficus heterophylla, *Roxb.*

WAL AJWAIN. Hind. Ptychotis sylvestris.

WAL KAHA. Singh. Curcuma zedoaria *Roxb.*

WALA KHARWALA. Hind. Salix Babylonica.

WALAN, the name of a large but rare and much valued tree in Amboyna, which was first described and figured by Rumphius, in his 'Herbarium Amboinense,' and called by him Ichthyoctonos montana. The inhabitants of Amboyna use the bark of the roots for catching fish. It is powdered, and when it is collected for fishing, a large party attends. It is powdered by a single individual with a large stone, and whilst this process is going on, the rest lie round the stone in a circle; when all is over, a signal is given by one of them crowing like a cock; they then arise and collect the powder into little baskets which is reserved for use. In catching the fish the party goes in the morning early, and after throwing the powder upon the water and mixing it till it foams, they cast a net over the river, and then retire from the river, maintaining silence till the poison has acted on the fish. In the course of an hour the net is generally found full of half-dead fish. The fish will recover from the effect of the poison if thrown into fresh-water and are quite wholesome as food, although they will not keep so long as fish caught by other means. Rumphius procured some of the bark, and, omitting the ceremonies, found it a very successful mode of fishing.—*Eng. Cyc.*

WALA PALLAM. Tam. Plantain fruit, Banana.

WAL BAMBOO. Singh. Eugenia laurina.

WAL'D. Ar. He was born ; son : walid. father, therefore maulud, Ar. born, birth. a manludi.

WALDOMBE. Singh. Calophyllum acuminatum.

WALE. See Karang Bollang.

WAL EKA WERIYA. Singh. Ophiorrhiza mungos.

WALERANG. Jav. Sulphur.

WALER, a term used by the British in India to designate N. S. Wales horses. The supplies from British India itself and the neighbouring inland countries have been insufficient to meet the demands and wants of India, and since A.D. 1840 small batches have been received from the Cape of Good Hope. These are horses of good figure and good temper, suitable for riding horses and for draft, but like the Arab horse higher priced than can easily be afforded. Australia however has taken a hold on the Madras and Calcutta markets, and its horses are termed "Walers." What number of new horses of all sorts are needed for British India annually, is not known, but the town of Madras alone takes about sixty every month, and the following have been the numbers of Walers imported into Calcutta since 1863-64.

1863-64 ...	... 1,020	1867-68 ...	... 899
1864-65 ...	... 469	1868-69 ...	... 1,198
1865-66 ...	... 667		
1866-67 ...	... 1,025		5,278

WAL-GONA-GASS, Singh. Ficus cinerascens, *Thw.*

WALGU-MERIS. Singh. Cubebs.

WALI. There were formerly four Wali or tributary princes in Persia, viz., the prince of Georgia, Sinna, Loristan, and Haweiza; but the Wali of Sinna is the only one remaining. The prince of Haweiza was called Moula, or holy, and was a syed or supposed descendant of Mahomed. Kalb Ali Khan, the murderer of Messrs. Grant and Fotheringham, was descended from the Wali of Loristan, who was of the Feili tribe.—*Rich's Residence in Koordistan, vol.* i. *p.* 211.

WALID, Khalif of Bagdad, the 6th of the Ummiad khalifs, ascended the khalifat in A. D. 708. He conquered Sind, and carried his arms to the Ganges. Three years thereafter in A. D. 718, his general Mahomed bin Kassim overran Guzerat and spread devastation in his progress. He advanced on Chittore, but he was met and completely defeated by Bappa, a descendant, of Goho who had founded Edur.—*Elliot Hist. of India.*

WALI KUKUN, a wood of Java, equal to the kusambi in weight, and exceeds in hardness: it is employed for anchors, naves of wheels, machinery, &c.

WALKERA SERRATA. Willd. Gomphia angustifolia, *Vahl*, a native of Malabar and Ceylon, has serrate crenate leaves, racemes of flowers somewhat corymbose, and the lobes of the calyx lanceolate yellowish flowers and reddish fruit. The roots and leaves are very bitter, and are used in decoction by the inhabitants of Malabar as a tonic and anthelmintic.

WALKER ERDE. Ger. Fuller's earth.

WALKESHWAR, near Bombay, has a tank called Ban-Ganga, fabled to have been produced by Krishna firing an arrow at the spot.

WALKING-STICK, a staff or cane carried in the hand for ornament or support. There are numerous kinds, as Malacca-cane, Penang-lawyers, Wanghee, Supple-jacks, and other fancy varieties. The bamboo furnishes useful walking-sticks, as also the various palm trees, the Licuala, cocoanut tree, sago palm, betel palm, palmyra palm, also the kumb'ha wood of the Gmelina arborea, and the Chittunkoodoo wood of the N. Circars, perhaps Chitankaloo or Wrightia tinctoria.

WALKO-GUNDO. SIND. Artemisia Indica, *Willd.*

WAL-KURUNDA. SINGH. Cassia bark.

WALLA. See Rajpoots, Wala.

WALLACE, Alfred Russell, a naturalist of England, author of a work in two volumes on the Eastern Archipelago. Mr. Wallace (ii. 250) believes that the numerous intermediate forms which occur among the countless islands of the Pacific are not merely the result of an intermixture of their races, but are to some extent truly intermediate or transitional, and that the brown and the black, the Papuan, the natives of Gilolo and Ceram, the Fijian, the native inhabitants of the Sandwich islands, and those of New Zealand, are all varying forms of one great Oceanic or Polynesian race. Professor Huxley however is of opinion that the Papuans are more nearly allied to the negroes of Africa than to any other race. Mr. Wallace has given to Europe a very full knowledge of the birds of that extensive region. Livistonia rotundifolia is supposed by Mr. Wallace to be the fan-palm, of the leaf of which the people of Celebes make water buckets and baskets.

WALLAEEL. TAM. Bangles.

WALLANCHOON, a pass in Nepal in Lat. 27°52′ long. 87° 14′. The crest of the pass is 16,775 feet above the sea. The path leading up the pass for eight miles is a narrow, stony, and steep gorge. The top is a low saddle, between two ridges of rock.

WALLARAI KALENGU. TAM Potato.

WALLAS. JAV. Aristolochia Indica.

WALL-BAT. See Cheiroptera.

WALLEEBHIPUR. See Kattyawar.

WALLEE——? Cinnamon.

WALLEH. See Kattyawar.

WALLEPANE. See Rhodia.

WALLEROO. A Dhangar tribe in the northern division of the Madras Presidency. They are also styled Yerra-walleroo.

WALL FLOWER. Cheiranthus cheiri.

WALLICH, Nathaniel, a medical officer of the Bengal Army, an eminent botanist. In 1828, he arrived in England with an enormous number of specimens of plants, which he had been accumulating for several years, collections made by himself and those along with him, in the Calcutta garden, in Nepaul, in Singapore and Penang, in Oude, Rohilcund, the Valley of Deyra, Martaban, Ava, &c., collections made in Silhet by Francis de Silva, in Kumaon by Robert Blinkworth, in Srinaghur by Kamroop, in Tavoy and the Tenasserim coast by William Gomez, plant collectors under Dr. Wallich: in addition were specimens collected by Heyne in the Peninsula generally, by Noton in the Neilgherries, also by Moorcroft in the more elevated mountains bounding India on the north, in the Himalayan range by Dr. Royle, in Sirmor by Mr. S. Webb and Dr. Govan, in Silhet and Chittagong by Bruce, in Pundua by Smith, and in Penang by Porter.

His book, the Plantæ Asiaticæ Rariores, consists of three volumes folio, and contains 295 coloured lithographic plates with a map of India, on which are delineated the different routes of the principal botanists : the letter-press contains some admirable monographs by Professor Nees Von Esenbeck on Indian Laurinea and Acanthaceæ, by Mr. Bentham on the Labiatæ, Professor Meisner on the genus Polygonum, and Von Martius on Restiaceæ. This book was his magnum opus, and that on which Dr. Wallich's fame as a botanist may safely rest. Dr. N. Wallich, of the Bengal Medical Service, was a distinguished botanist, and long in charge of the Government Gardens at Calcutta, having succeeded Dr. Roxburgh. He was the author of Plantæ Asiaticæ Rariores, or description and figures of a select number of unpublished Indian plants, Lond. 3 vol. 8vo. Wrote on Indian woods, in Bl. As. Trans. 1833, vol. ii. 77. On two new species of Saccolobus and other plants, in As. Res. vol. xiii. 369. On some rare Indian plants, Ibid, vol. xii. 566. On a new species of wild Nepaul camelia. Ibid. 428. Dr. N. Wallich also collected birds in Nepaul, and besides editing his portion of the 'Flora Indica' of Dr. Roxburgh, commenced, in India, an illustrated work on Nepal plants, Tentamen Floræ Nepaulensis, which was the first specimen of lithography ever produced in India ; and after his return to England, he published a series of 296 plates of plants in the Plantæ Asiaticæ Rariores. The history of the great Wallichian Herbarium is given in detail in the lithographed list of its contents which was distributed with it, also in the 'Plantæ Asiaticæ Rariores,' and in the introduction to Wight and Arnott's Prodromus. It is not easy to say how many species are contained in the Wallichian collection, but the 9,000 numbers may, we think, be diminished by at least one-fourth, as Dr. Wallich, being obliged to distribute without describing, very judiciously avoided uniting apparently distinct forms. Drs. Hooker and Thomson therefore estimate this great collection at between 6,500 and 7,000 species.—*Hooker and Thomson. Dr. Buist's Catalogue. Wight's Prodromus Floræ, vol.* i. *p.* 18. *List of East Indian Plants.*

WALLICHIA OBLONGIFOLIA, the Ooh of the Lepcha, a palm which grows in Sikkim. It affords an admirable fodder for horses, who prefer it to any other green food to be had in those mountains.—*Hooker, vol.* i. *p*. 143.

WALLI GADDA, also Chella-gadda, or Genasu-gadda. Tel. Batatas edulis, *Choisy*.

WALLRATH. Ger. Spermaceti.

WALLURSI. Tel. Walsura piscidia.

The walnut tree, Juglans regia, grows wild in the N. W. Himalaya at heights from 8,000, to 10,000 and 11,000 feet; but it does not ripen its fruit above 9,000. It has long been cultivated in Persia and Turkistan, and has been taken westward to England and eastward to China. Honigberger states that a twig of the walnut tree, Juglans regia, is kept in a room as a means of dispelling flies. The same author mentions that bitter almonds are poisonous to wild beasts. The Persian walnuts are most esteemed. The kernels are eaten, or are made into pickles or ketsup. —*Faulkner. McCulloch. St. John's Forest Trees of Britain, v.* i. *p*. 66. *Dr. J. L. Stewart, Punjab Plants. Honigberger, Smith Chinese Mat. Medica.*

WALNUT of Belgaum, also Indian Walnut, Aleurites triloba.

WALNUT OIL, a bland and useful oil obtained by expression from the walnut.—*Simmond's Dict.*

WALSURA. Tam. Walsura piscidia.

WALSURA GARDNERI. Thw. A small tree growing in the central province of Ceylon, at an elevation of 2000 to 4000 feet.—*Thw. En. Pl. Zeyl. vol.* i. *p*. 61.

WALSURA PISCIDIA. Roxb.; *W. & A.*; *W. Ill.*

Joe-boe,	Burm.	Valarasi,	Tel.
Walsura,	Tam.	Wallurasi,	,,

This tree grows in the Circars, is very plentiful in the Pegu, Toungboo, and Tharawaddy forests. Its timber is large, heavy and strong, white coloured and adapted for every purpose of house building. In India the bark is thrown into ponds to stupify fish, which, coming to the surface, are easily taken, and are not considered injurious to be eaten.—*Royle, Ill. Him. Bot., p*. 143, *Voigt, Dr. McClelland.*

WALSURA ROBUSTA. A tree of Sylhet, the bark is not employed as a fish poison.—*O'Shaughnessy, page* 247.

WALSURA TERNATA. Roxb.; *W. & A* is the Vada-valasa or chinna-valasa of the Teling races.

WALSURA VILLOSA. *W. & A.*, is a tree of Moulmein.

WALTJEDDE. Singh. Cyclea burmanni, *Arnott.*

WALUKENE. Singh. A tree growing in the western and southern districts of Ceylon; it weighs 39 lbs. per cubic foot, and lasts about 10 years. It is used for masts of dhonies.—*Mr. Mendis.*

WALU-LUWAY. Singh. Amygdalus communis, *Linn.*

WAMAN-DUADASI. From waman, a dwarf, and duadasi, the 12th day of the month Paksh, about the 10th September. It is a hindoo ceremonial in commemoration of the fifth incarnation of Vishnu, who assumed the form of a dwarf to prevent Bali by his austerities acquiring dominion over three worlds. The dwarf put his foot on Bali's head and crushed him to Patali.

WAMPEE. Chin. Cookia punctata, the Chinese wampee tree.

WAN. Jap. Pease.

WAN, also Wanna. Hind. A shrub, or plant; hence,

Spera Wan, Populus Euphratica.

Pastu Wanna, Grewia oppositifolia.

Pa Wanne, Clematis Nepalensis, also Boucerosia aucheri.

Pastu Wanne, Grewia villosa.

Perei Pastu Wanne, Fluggea virosa.

Ple Wanne, Flacourtia sepiaria.

Spera Wanne, Flacourtia sepiaria, also Ærua Bovii.

Wara Wanne, Ribes rubrum.

Khara wanne, Ehretia aspera, also Solanum verbascifolium.

WANA. Divinities of the air in opposition to Asa, pl. Asen, which according to Bunsen, means " existent," " living ones."

WANA-GANA-KALOO. Curraganica, Punchunganigaloo. These are dealers or shopkeepers of Telingana and called, in common parlance, by the Hindi word "Teli" or Oilman. They are petty traders and shopmen.

WANDA, a river near Chichundra in Baitool.

WANDAK. Hind. Clematis Nepalensis.

WANDEROO. Singh, is the name in Ceylon for the Presbytes ursinus, the P. thersites, P. cephalopterus, and other species. The name has also been applied, though erroneously, to the Silenus veter, *Linn.*, of the Malabar coast. The low country Wanderoo, P. cephalopterus, is replaced in the hills by the larger species, P. ursinus, which inhabits the mountain zone of Kandy, P. thersites is chiefly distinguished from the others by wanting the head tuft; is so rare that it was for some time doubtful whether the single specimen procured by Dr. Templeton from the Nuerakalawa, west of Trincomalie, and on which Mr. Blyth conferred this new name, was in reality native; but the occurrence of a second, since identified by Dr. Kelaart, has established its existence as a separate species. Some are as large as an English spaniel dog, are of a darkish grey colour, and black faces with great white beards round from ear to ear, which make them show just like old men. This sort does but little mischief, keeping in the woods, eating only leaves and buds of trees, but when they are caught they will eat anything. Knox, whose experience during his long captivity was confined almost exclusively to the hill country around Kandy, spoke in all probability of one large and comparatively powerful species, Presbytes ursinus, which inhabits the lofty forests, and which as well as another of the same group, P. thersites, was, till recently, unknown to European naturalists. In Ceylon there are five species, four of which belong to one group, the Wanderoo, and the other is the little graceful grimacing Rilawa, which is the universal pet and favourite of both natives and Europeans. The Tamil conjurors teach it to dance, and in their wanderings carry it from village to village, clad in a grotesque dress, to exhibit its lively performances. It does not object to smoke tobacco. The Wanderoo is too grave and melancholy to be trained to these drolleries.—*Tennent, Skets. Nat. Hist. p.* 10.

WANDIWASH, a fort 20 miles north of Gingee, was stormed in October 1752, by the sepoy soldiers under Major Lawrence.

WANEDILE. A rather hard, fine, close, even-grained, heavy, Ceylon wood.

WANGIWANI. See Token Bessey.

WANGLO——? Gingelly seed.

WANGPO. See Kunawar.

WANGTONG, north and south, two islands, about a third of a mile apart, North Wangtong forming one side of the Bocca Tigris.

WANGTU. The breadth of the Sutlej at Wangtu is about ninety feet, the height of its bed, as determined by Gerard, 5,200 feet.—*Cleg. Punjab Reports, p.* 56.

WANI, a lingaet or jungum sect numerous in the Canarese speaking country and extending in the direction of Poonah and Bombay. They arrange themselves into the four sections Rasot, Diksot, Melwant and Tailwant, who eat together but do not intermarry. The Tailwant drink only tank water, which is first strained and carefully covered with a cloth to prevent injury to animal life. The Rasot have no guru, which the other three have. The Wani are shopkeepers and agriculturists. They marry girls when five to eight years old. The couple are placed sitting on a mat or bullock saddle, to which they are lifted on the crossed hands of four men, who put betel leaf in their mouths and complete the ceremony. Widows are remarried. They inter their dead in a sitting posture, and on the third day, sprinkle rice and milk on the grave. See Bania, Jain, Jungum, Lingaet.

WANIA, also Vania, pronunciations of the Bania name.

WANIKA, the general name given to the African tribes near the Suhaili coast. They fear an imaginary being called Muansa, which they suppose to be a wild beast in the woods, and an imaginary spiritual shade called Koma.

WANKAI. Tel. Solanum melongena, *Linn.*

WANTE VENTRUKULU. Tel. Camel's hair.

WANWANGAN. Hind. Podophyllum emodi.

WANWAR, of Punjab and Sind, the cotton plant.

WAPACHA. See Somal, Beer-us-somal.

WAR. Syriac, the general term for a stony district. War-ed-djamous, "the war or district of the buffaloes."—*Robinson's Travels, vol.* ii. *p.* 127.

WAR. Hind. Ficus venosa.

WARA. Hind. a field, a common termination to towns and portions of towns, as Anhilwara, Dherwara, Bahmanwara.

WARA, a town in the Konkan near Bombay from which was obtained a sculptured slab. The character used in its inscription is that of the Saurashtra coins, and long-tailed Deva-Nagari. No gods are mentioned, but there is a trisula on the slab. The inscription is a fragment, and cannot be fully translated; but Mr. Prinsep says it may be as old as the Gujerat coins with Greek heads upon them. The trisula, without the mention of hindu gods, would seem to indicate that it is not necessarily an exclusive emblem of Siva.—*Prinsep's Antiq. vol.* v. *p.* 340.

WARA GUDU. Tel. Cycas circinalis, *Linn.*

WARAHI MUSALI. Sans. Mooslie.

WARALA. Tel. Singh. Clove oil.

WARALI. See Berar, India.

WARANGAL, about 90 miles N. East of Hyderabad in the Dekhan, the capital of the ancient Andhra kingdom, ruled over by the Adeva Raja dynasty. Warangal was taken A. D. 1309 by Kafoor, the general of Alla-ud-din. It is said also to have borne the name of Arnabunda. A sculpture slab obtained there had an inscription in Telugu and Oorya, with Sanskrit slokas. Its date was Saka 1054, or A.D. 1132, being the year Chetrabhanu of the Vrihaspati Chakar, or sixty years' cycle of Jupiter. Kari, Ganesa, Saraswati, Siva, Maheswara Ravi, Souri (or Vishnu) are mentioned, also Raja Rudra Deva. Rudra Deva is the raja mentioned in the Jagannath temple annals as Churang or Chorgunga, and was the founder of the Gunga-Vansa dynasty. He was a benefactor to Jagannath, adorned it, and populated its neighbourhood. The inscription contains a long account of Rudra Deva's genealogy and of his battles. There are not any praises of brahmans, or even mention of them! From the mention of Ganesa, his worship must have been used in the twelfth century. —*J. B. As. Soc. vol.* vii. *p.* 901.

WARANGAN. Malay. Ficus benjamina, *Linn. Rumph.*

WARANGAN or Barangan. Malay. Red sulphuret of arsenic. See Arsenic.

WARANGAN PUTEH. Malay. White oxide of arsenic.

WARANGARI. See Aidumia, Triton's bay.

WARAN SANKAR or Varna Sankara, Sans. The mixed castes of the hindoos, other than the four pure ones.

WARA TARA. Tam. Dichrostachys cinerea, *W. & A.*

WARA-WANE. Hind. Ribes rubrum.

WARBLER. A name applied to several genera and species of birds. The pretty blue-throated warbler Cyanecula suecica, of the N. W. Himalaya frequents the mustard-fields and low scrub, frisking about like the robin redbreast. All specimens examined in India had the spot on the breast rufous. On bleak situations in the Himalaya Mr. Adams met with the black-breasted warbler, Calliope pectoralis. It is a solitary bird, and affects the stunted juniper-bushes at high altitudes; it is about the size of the redstart, which in habits it much resembles.—*Adams, Naturalist.*

WARCH——? Acorus calamus.

WARCHE CHUNAI. Hind. Asparagus Punjabensis.

WARD, William, the colleague of Carey, in the Serampore Mission, was born at Derby in 1769 and learned the trade of a carpenter. He arrived at Serampore on the 13th October 1799. He was fearless, fond of work, somewhat democratic, slightly opinionated, with a capacity for organization, and with that marvellous control over Asiatics which belongs to that temperament. The book he wrote on the hindoos is a View of the History, Literature, and Religion of the Hindoos, a book which with all its exaggerations and affected prudery, is still most valuable as illustrating the popular habits, manners, and religious belief of the masses, and as giving the manners and customs of the E. I. Company's servants at the beginning of the 19th century.

WARD, Sir Henry, a Civil Servant of Britain, Governor of Ceylon, and who died of cholera while Governor of Madras in 1860. Ceylon was struggling against difficulties which ended in destruction to nearly the entire planting and mercantile community. The dissentions of Lord Torrington's administration had occasioned distress, which continued during the languid rule of his successor. With Sir Henry Ward new vigor returned to the colony. He gave encouragement to settlers, removed the many difficulties which beset them, he constructed great trunk roads throughout the length and breadth of the island, and opened up the districts by admirable branch communications. Rivers and streams were provided with temporary bridges until the finances increased, when they were replaced with permanent structures, and ere he left the colony, he had the satisfaction of opening the suspension bridge at Gampola and the new bridges at Katugastututy, magnificent structures, which will remain lasting monuments of his rule and will bear his name to posterity. Sir Edward Barnes may be said to have founded the colony, and Sir Henry Ward to have formed it.

WARDHA. A river which rises in the Satpura hills between Nagpur and Betul. It is a river of importance in the central Dekhan. It flows south-east, separating the Nagpur, Wardha, and Chanda districts of the Central Provinces from the Berars and the Nizam's dominions. Its first great affluent is the Pain-Ganga, which it receives on the Nizam's or right bank, about 190 miles from its source; 64 miles lower down (a little above Chanda) it joins the Wainganga, and the united stream, thenceforward known as the Pranhita, flows on in the same direction to join the Godavery at Seroncha. It is at the junction of the Wardha with the Wain-Ganga that the great obstacle to the Godavery navigation scheme, known as the "Third Barrier" occurs. The bed of the Wardha is throughout rocky and deep, in the monsoon it becomes a furious torrent, and carries a considerable body of water. The railway bridge which crosses it at Pulgaon is of iron, and consists of fourteen sixty-foot girders, resting on masonry piers. In the hot months, however, the stream is everywhere fordable. Timber rafts can be floated down this river. The valley of the Wardha is a rich tract of country lying between the river and a range of hills, which, receding as the Wardha district is entered, leave a considerable open space, which widens gradually to the south. In general the country is well wooded, and in the eastern portion of the Hinganghat subdivision the jungle predominates over the cleared and cultivated tracts. The plain of Hinganghat and the plain and hill of Girar are spots of great geological interest. At the former place a fresh-water stratum may be traced, and silicified wood picked up in abundance at the latter, the hillside exposes the fresh-water stratum in all its varieties, while the plain is strewn with curious zeolitic concretions resembling betel-nuts or nutmegs, which have issued from the soft subjacent rock. The geologic formation is interesting. The trotting bullock of this part of the Central Provinces is famous. The breeding of horned cattle generally is carried on on a large scale in the northern and hilly part of the district, which affords excellent pasture in the cold season, but in summer most of the herds are taken to the jungles of Mandla and Chanda. The breed of buffaloes too is very fine. The central tahsil or revenue subdivision of the district is of the same name, having an area of 801 square miles, with 468 villages, and a population of 139,210 souls according to the census of 1866. The land revenue for 1860-70 was Rs. 2,08,119.—*Madras Conservator's Reports, p. 4. Central Provinces Gazetteer.*

WARDE-MAJOR. The title of a native military officer of the British Indian Army.

WAREALEE. Guz. Fœniculum panmori, *D. C.* Fennel seed.

WARI. Maleal. Asparagus racemosus.

WARING, Edward John, a medical officer of the Madras army from 1849 to 1859 author of Bazaar Medicines, Pharmacopœia of India, Manual of Practical Therapeutics, an Enquiry into the Pathology and Statistics of Abscess in the Liver. Medical Notes on the Burmese. The Vital Statistics of the Madras Army. Statistical Notes on Tropical Diseases.

WARING TREE. See Java.

WARINGIN-TREE, is the Ficus benjamina, very closely resembling the banyan tree of the continent of India; spreading in like manner over a large space of ground, the lateral branches sending down shoots, which take root, and become a supplementary trunk. The circumstance of the wilder Papuans taking delight in residing among the branches of the waringin-trees, whose dense foliage and horizontally spreading branches render them well adapted for the purpose, has been repeatedly noticed by travellers. This tree is of peculiar interest in connection with the earlier history of the native races of the far East, as it is regarded with a superstitious veneration by all the aboriginal tribes of the Archipelago, as well as by those of the northern coasts of Australia, and by the lower classes, at least, of the Chinese.—*Mr. Earl. p.* 116.

WARK. Hind. a leaf of a book, a leaf of a tree. Wark-i-nukra, silver leaf. Wark-i-tila, gold leaf, &c.

WARMANDE. Hind. Vitex negundo.

WARNA. See Dyes.

WARRALA. Singh. Cloves. Caryophyllus aromaticus, *Linn.*

WARREE. Hind. A field.

WARREE —— ? A grain dealer.

WARREN HASTINGS, the first Governor General of British India. On his return to England, he was impeached for his conduct, but after a prolonged trial, he was acquitted on the 23rd April 1795.

WARROGOO KOLI, or Warrugu koli. Tam. Sypheotides auritus, *Latham.* Florikin.

WARRUGU. Tam. Paspalum frumentaceum.

WARRY —— ? in India the sedimentary deposit from cornelian in grinding the stone which is used for polishing the beads.—*Simmond's Dict.*

WARRYATO.—— ? See Capreæ.

WARTY CHAMELEON. Chamæleo verrucosus,

WARUMBA. Hind. Solanum xanthocarpum.

WASALA SUTTAN. See Wijao.

WA-SAWAHILI. See Somal : Beer-ussomal.

WASHEER. See Khash Rud.

WASHERMAN'S WELL, deemed in the East, the most impure of all receptacles. These wells are dug at the sides of streams, and give a supply of pure water filtering through the sand.—*Tod's Rajasthan, vol.* i. *p.* 223.

WASHING OF FEET, in John xiii. 10, " He that is washed, needeth not save to wash his feet." The hindoos walk home from bathing bare-foot, and on entering the house wash their feet again.

WASHING OF HANDS. See Bathing.

WASHISTEE, a river of the W. Ghauts, lat. 17° 50′, lon. 73° 36′, runs S. W. S. E., W., into Indian Ocean, length 55 miles.

WASH LEATHER. See Hides.

WASHO. Hind. Rhus buckiamela. Kachwassal is Urginia Indica, Pad-Wassal is Allium cepa.

WASI, the native name of Bassein, an island near Bombay.

WASMA. Hind. Indigofera tinctoria.

WASP. Salvolatile applied immediately is a specific for the sting of a wasp.

The Mason wasp is a name given to several genera and species of Hymenopterous insects of the family Sphegidæ. One of these, Pelopæus Spinolæ of St. Fargeau, is distinguished by its metallic lustre, introduces its eggs into the body of the pupa of some other insect, which it thrusts into keyholes and other apertures of Indian houses, and encloses the whole with moistened earth. The young parasite, after undergoing its transformations, gnaws its way into light and emerges a four winged fly. The Ampulex compressa which drags about cockroaches into which it has implantedits eggs, belongs to the same family. —*Sir J. E. Tennant's Ceylon, p.* 257.

WASS, Wassa, Wasitali, also Wassawassi. SING. Mace oil.

WASSO, in buddhism, the season of sacred rest. It is still celebrated at Bhilsa, by the illumination of the shrine of Lohangi Pir, at his zearat, on the full moon of Asarh.

WASSUMBU. MALEAL. Acorus calamus, *Linn.*

WASTE LANDS are abundant in British India, but owing to the prevalence of the village rights, the family rights and those of copartnery, it is not easy for a stranger to purchase portions. Lord Stanley in his despatch of 22nd December 1858, ordered such to be sold in fee simple, and this was agreed upon in Resolution of 17th October 1861.

The population of British India is about 150 to the square mile, while that of England is 350. This one fact, if we remember the small holdings of the peasantry and the absence of machinery and improved agriculture, will give us some idea of the vast extent of uncultivated land. Colonisation of the plains, in the ordinary sense of that term, is impossible for a white race. But so far as extent of land is concerned, India could for the next century absorb more settlers than Australia or even Canada. The function of the European in the plains is that of a captain of labour, not of a labourer, and the same is meanwhile true of the hills. Even there the white man, the pensioner or veteran, will not work with his hands in the midst of a black population however sparse. But it is to the capitalist not the labourer, and to the large rather than the small capitalist, that India offers advantages. And there is this fortunate circumstance that wastes abound in the very climate which is adapted for the European. On the plains, wherever they are fertile, especially in the provinces drained or watered by large rivers, the population is as high as 600 and 700 to the square mile. But in the hills the population is too scanty to meet the present labour demand, comparatively trifling as it is. This will be the future difficulty of the settler, and it is one he will be able to overcome only by a familiarity with the language and character of the natives, and by a scrupulously upright treatment of them, to which indeed self-interest, as well as higher motives, will lead all but the uneducated. In compiling a list of the culturable wastes, we divide them into the two classes of those which enjoy hill climates and those which are fitted only for capitalists who, like the indigo planters, will purchase the produce grown by native labour. It is impossible to distinguish accurately in every case between wastes in the hills and in the plains, but the distinction is generally adhered to below. The figures refer to acres.

In addition to these, hundreds of miles in the Punjab are at present locked up by a settlement which allows the neighbouring villagers to keep them for ever waste if they please. Several Europeans have purchased from the natives small patches of five or ten acres, but they complain bitterly of the litigation which the co-parcenary tenure involves. To many, the Punjab will prove most attractive for tea planting. In Cachar on the east, many Europeans have engaged in tea planting, in Kangra and Simla, four joint stock companies and private individuals, have embarked in the tea cultivation. The Government of Oude issued the following notice immediately on the receipt of Lord Canning's Resolution. "Grantees wishing to avail themselves of the terms stated in the Fee-simple Resolution, are requested to intimate their wishes with as little delay as possible to the Deputy Commissioner of the District in which their grants are situated. Rules of Procedure will shortly be issued."

WASSINA PILLU, also Cavatum Pillu, TAM. Andropogou citratum. Lemon grass.

WAT, SINDI, is made of wheat boiled in milk, and seasoned with salt or sugar, and is the nashtah, or morning meal, of the peasantry in Sind, eaten as soon as they rise.—*Masson's Journeys, vol.* i. *p.* 375.

WA-TAI-GA KYOUK. BURM. Tabashir.

WATAN. AR. A native country. In Western India a patrimonial inheritance. Watandar, the holder of a hereditary right, a property or office.

WATCH. The hindoos and mahomedans in India divide the day into four watches, and the night into the same number; the day being considered to extend from sunrise to sunset. The watches are again divided into ghurees, which are 24 minutes each in length and which are usually called an Indian hour. As in the summer the days are longer than the nights, each day watch will then be longer than any watch of the night, though, from the necessity of each watch comprising an exact number of ghuree, there will generally be the difference of one ghuree between two watches of the same day. There is much variation in this respect, and although, in the latitude of India, the difference is not so great as it would be in a country more towards the north, it is still so inconvenient that the natives of India rarely understand their own method of dividing the day, and readily adopt the English mode.

Water, with the hindoos, is used as a synonym for climate; Ab-o-howa, or water and air, is applied similarly by the mahomedans.

In every site of early habitation, water appears to have been the mother of society. Water has been the first of the common gifts of nature to all human beings, which has been claimed and appropriated by individuals. Civilization, society, government, law appear to have originated in those countries which are partly watered, that is, have water only at certain watering-places or great rivers, or at perpetual springs, but have it not at all seasons generally in the land. Nevertheless wells, from the first day of human existence, have led men to congregate at these particular watering spots, and to appropriate them as a society to their own peculiar use. The shepherd and hunter states are the retrograde and not the progressive steps of the human race from one stage of civilization to another, and the wandering uncivilized tribes of mankind, now in the hunter or shepherd state in America and Asia, are the existing remnants of an earlier civilization, are varieties of one species which have originally stood on a far higher material and intellectual grade of social existence than at present. Fountains sacred to the sun and other deities were common to the Persians, Scythians and Hindus, and both the last offered steeds to him in sacrifice. The hindu races of Southern India, familiar only with the tropical countries in which they dwell, use water as the term for describing the effects of a climate on health. In this sense it is more the salubrity of a locality that is alluded to. At the beginning of their religious rites there is a preliminary offering of water called Ankurapana. Isaiah xxxii. 20, says, "Blessed are ye that sow beside all waters" and in the East Indies, where the rains fall periodically and where a large quantity of water is essential to the crop, the farmer is anxious to have a pool near the land he has sown, that if the rains be less than usual, he may draw the water out of the pool for his young rice. In Western Goozerat, it is customary for brahmins to use brass or copper vessels belonging to persons of other castes, after they have scrubbed them well with dust and water, and washed them. A leathern bucket need only be washed, because, having come originally from the house of the tanner, who is a person of very low caste, it is supposed that no further defilement can happen to it. Some puritanical brahmins, however, will neither drink water which has been drawn in a leathern bucket, nor even use it for ablutions. In parts of Western Goozerat there is frequently but one well in a village, in which case the outcastes draw water on one side of it, and retire, and the brahmins and other castes, when they are gone, come and draw water from the other side. It is usually the case that there are many wells in a village, and that one is specially set apart for outcastes. The well is defiled if a dog or other animal have fallen into it, and, for its purification, water must be drawn from it five times, and Ganges water, or cow's urine, poured into it. If a brahmin or waneea woman, returning home with water from the well, meet a funeral, she will sometimes throw away the water at once as defiled, sometimes veil herself, and move aside averting her face, and if the corpse be not carried within a few paces of where she stands, the water is preserved from defilement. The dead body of an animal defiles also, and, if one happen to lie on the way to the well, no water is procurable until it has been removed, and the ground has been purified. Some women will throw away the water if a crow alight on the vessel and put his beak into it, but, as the case is rather a common one, other women take no notice of it. The symbols of the three hindoo deities are respectively time, water and fire. The divinity of water, says Dubois, is recognised by all the people of India. Besides the well-known worship of the holy Ganges, the tribes of the Neilgherry hills worship rivers under the name of Gangamma, and in crossing them, it is usual to drop a coin into the water as an offering and the price of a safe passage. In the Deccan and in Ceylon, trees and bushes near springs may often be seen covered with votive offerings. The Khond race also worship rivers and fountains. The people of Sumatra are said to pay a kind of adoration to the sea, and to make it an offering of cakes and sweetmeats on their beholding it for the first time, deprecating its power of doing them harm. The offerings on the Ganges, to Khajah Khizr, are also of this character.

In the Punjab four kinds of water are found in the Rewari wells, all of which are used in irrigation, but the produce of each varies. The first is Shirin or Mitha, *i. e.* sweet water, the irrigation from which in common seasons, does not produce such remarkably fine crops as the other kinds ; but this is infinitely more than compensated by the fact that, in drought years, the produce is certain and abundant.

Second, Matwallah, or hard water, the land irrigated by which produces very fine crops except in drought years, when they are rather inferior, though still good and certain.

Third, Malmalla, or brackish water ; with which good crops but inferior vegetables are produced in common years, in drought however both are inferior.

Fourth, Khari, shor, or very brackish water; this irrigation is said to bear finer and more abundant produce than the others.—*Lubbock Origin of Civil, p.* 200. *Forbes' Ras Mala or Hindoo Annals, vol.* ii. *p.* 239-40. *Ward;*

WATER CRESS. Nasturtium officinale.

Leaves, Loot putha. | Seeds, Hurufs.

The water cress is a native of Great Britain, is generally raised from slips. It thrives best in running streams, and is to be had all the year round. It is grown from seed in beds near a water course, and the supply may be kept up for any length of time. A small black caterpillar is very destructive to it: the only remedy is flooding the plants for a short time.—*Jaffrey*. See Nasturtium.

WATER CRINUM. See Crinum.

WATER DILLENIA. See Dillenia.

WATER FLEAS. See Crustacea.

WATER FOWL. Aquatic birds, ducks, teal, &c., are largely brought to the markets of the principal towns of India, at certain seasons of the year, and may be procured in abundance. An enormous quantity of water-fowl breed in Tibet, including many Indian species that migrate no further north. The natives collect their eggs for the markets of Jigatzi, Giantchi, and Lhassa, along the banks of the Yaru river, Ramchoo, and Yarbru and Dachen lakes, amongst other birds, the Saras, or giant crane of India, repairs to these enormous elevations to breed. The fact of birds characteristic of the tropics dwelling for months in such climates is a very instructive one, and should be borne in mind in speculations on the climate supposed to be indicated by the imbedded bones of birds. It may however be remarked, that the Saras (Grus antigone) also breeds south of the Himalaya, and that specimens too young to fly are occasionally brought for sale even to Calcutta. Turner, describing the lake "Ramchoo," remarks, that it is frequented by great abundance of water-fowl, wild geese, ducks, teal, and storks, which, on the approach of winter, take their flight to milder regions. Prodigious numbers of saras, the largest species of the crane kind, are seen there, at certain seasons of the year, and they say that any quantity of eggs may there be collected: they are found deposited near the banks. I had, he says, several of them given to me when I was at Tassisudon, during the rains; they were as large as a turkey's egg, and I remember being told that they came from this place; but whether or not they were those of the saras, I cannot venture to pronounce. Instances have been known of the Saras breeding in captivity, when a pair was allowed the range of a large walled garden (protected from jackals) containing shallow inundated enclosures for the growth of rice: in these the nest was commenced under water, and raised for some inches above the surface; the eggs are two in number, about 3¾ inches long by 2¼ inches broad, of a bluish-white, with a few distantly placed rufus specks and blotches. The nest of the European crane (Grus cinerea), a common Indian bird, is thus described by Major Lloyd, as observed by himself in Scandinavia. It usually breeds in extended morasses, far away from the haunts of men. It makes its nest, consisting of stalks of plants and the like, on a tussock, and often amongst willow and other bushes. The female lays two eggs, &c. Again, Major Cunningham, in his Ladak, &c., remarks that the water-fowl swarm on the lakes and on the still waters of the Upper Indus. I have, he says, shot the wild goose on the Thogji, Chanmo and Chomoriri lake at 15,000 feet; and Colonel Bates and I shot three teal on the Suraj Dal, a small lake at the head of the Bhaga river, at an elevation of upwards of 16,000 feet: but the time of the year is not mentioned by this author. About two days journey from Delhi is the Nujjufghur jheel, a great marsh covered with water fowl. The method of capturing them there accords with the practice that obtains in other parts of Asia. Earthen vessels, wide enough to admit a man's head into them and perforated with small holes, are allowed to float about for days on the surface of this jheel, until the ducks, teals, and water-fowl in general, seeing them daily, become quite accustomed to the sight and fearlessly swim around and even approach and peck at them. This preparatory step is followed by the fowler supplying himself with a wooden float, strong enough to support him. Using it like a hobby-horse under him, he launches himself into the swamp with an earthen vessel over his head of a similar size and kind, and similarly perforated as those indicated above. The float is dispensed with in many parts of the marsh that are shallow. The fowler likewise supplies himself with a bag of net work, which is tied round his waist, and thus equipped he silently paddles himself along with his hands under water, until he gets among the earthen vessels and fairly amid the birds. He commences his task by quietly and patiently pulling them down one by one by their legs and putting them into the bag, which is so well adjusted round his person, that the struggles of the birds do not scare away the rest. Some use small baskets of wicker work with a lid of the same material, which answers the purpose better. When the bag or basket is full the fowler recedes to the spot whence he set out on his aquatic expedition, and there empties the contents into a basket large enough to contain about four or five times the number of the small one and then begins anew. Large nets are also laid out on favorable sites towards which the ducks, &c., are driven, and are thus taken in great numbers. Mr. French says he is not aware if the decoy-bird is known among the natives, or if they adopt one as a means of entrapping others of its species. In Ceylon may be seen, floating on the surface of the deeper water, fleets of the Anatidæ, the

Coromandel teal, the Indian hooded gull, the Caspian tern, and a countless variety of ducks and smaller fowl—pintails, teal, red-crested pochards, shovellers, and terns. Fuligula rufina, *Pallas.* Spatula clypeata, *Linn.* Sterna minuta, *Linn.* Pelicanus Philippensis, *Gmel.* Pre-eminent in size and beauty, the tall flamingoes, with rose-coloured plumage, line the beach in long files. The Singhalese have been led from their colour and their military order to designate them the "English soldier birds." In China, the fenny margins of lakes and rivers, and the marshes on the sea-coasts, afford both food and shelter to innumerable flocks of water-fowl. The banks along the wide delta of the Pearl river and the islands in it, are frequented by immense flocks of geese, teal, ducks and other birds; and they are likewise very abundant and tame along the inland water-courses. Ducks are sometimes caught by persons who first cover their heads with a gourd pierced with holes, and then wade into the water, where birds are feeding; these, previously accustomed to empty calabashes floating about on the water, allow the fowler to approach and are pulled under without difficulty. The wild goose caught on the shores of the Pearl river, and the common goose of Chinese farm-yards, do not differ much, both of them being a plain ashy grey color, with a large knob at the base of the upper mandible, the domesticated species is almost too gross for the table from the ease with which it fattens. This bird and the mandarin ducks are both considered as emblems of conjugal fidelity, and a pair of one or the other usually form part of wedding processions. The epithet mandarin is applied to this beautiful fowl, and also to a species of orange, simply because of their excellence and beauty over other species of the same genus, and not as some writers have inferred, because they are appropriated by officers of government. The Yuen-yang, as the Chinese call this duck, is a native of the central provinces, and is reared chiefly for its beauty. It is one of the most variegated birds known, vying with the humming birds and parrots in the diversified tints of its plumage, if it does not equal them for brilliancy.—*Williams' Middle Kingdom, p.* 263-64. *Hooker, Him Jour. vol.* ii. *p.* 161. *Tour of India by French, p.* 193. *Tennent Sket. Nat. History, p.* 260, 262.

WATER HEN. The Indian water hen, Parra Sinensis, plumes of inferior kinds are made from its feathers. It is met with in the north of India, running over the leaves of the lotus. The best plumes are however made from the feathers of the heron of the Punjab.

WATER ISLANDS, in lat. 12° 2' to 12° 4' N., are of moderate height and lie off the coast of Cochin China.

WATER ISLANDS, or four brothers, 6 or 10 miles S. E. of Malacca Road, are high, small, round islands covered with trees. A fifth or larger one nearer the coast has abundant pure water.

WATER-LILY, the common name for the species of the family Nymphæaceæ. One of the most beautiful and the largest of the tribe is the Victoria regia. See Nelumbium Nymphæa rubra, *Roxb.*

WATER MELON. Cucurbita citrullus. Citrullus cucurbita, *Schræd.* See Melon.

WATERS, MINERAL, waters derive their distinctive characters from the formations or strata through which they flow. Those of the primitive formations are almost all thermal, and generally possess a high temperature. Those of the older secondary formations are generally of a lower temperature. The newer, secondary, and the tertiary strata, give forth cool mineral waters. The chemical contents—sulphuretted hydrogen, free carbonic acid, carbonate of soda, other salts of soda and of lime, silica, sulphate of magnesia, oxide of iron, free sulphuric and muriatic acids—vary in almost every individual case; but there is a general tendency in mineral waters from the primary formations to a sort of similarity of chemical contents, and so likewise in respect to the secondary and tertiary formations. Leaving out thermal waters, which are not designated mineral waters unless for some additional quality besides their high temperature, mineral waters are often classed into saline, alkaline, chalybeat, and sulphureous. Most of the celebrated Spas belong to one or other of these four classes,—the Cheltenham, Leamington, Harrowgate, Carlsbad, Marienbad, Kissingen, Wiesbaden, Seidlitz, and Baden Baden waters are saline-aperient, some hot and some cold; or, rather, it should be said that some of the springs at these places are saline-aperient; for there are other springs at the same towns possessing very different qualities. Alkaline waters are met with at Bath, Cheltenham, Leamington, Harrowgate, Scarborough, Carlsbad, Marienbad, Kissingen, Toplitz, Wiesbaden, Vichy and many other places. Among the places at which chalybeat waters, or water in which the iron is associated with much free carbonic-acid gas, are met with, are Tunbridge, Harrowgate, Brighton, Peterhead, Aix-la-Chapelle, Spa, Pyrmont, Schwalbach, Marienbad, and Seltzer. Sulphureous waters are found at Moffat, Askern, Harrowgate, Aix la Chapelle, and other places. It will be seen that Harrowgate possesses a large variety of these mineralized waters. A small number of springs contain iodine, and are on that account useful in certain maladies. There are springs of this kind at Tewkesbury, Cheltenham, Gloucester, Leamington, Builth, Llandrindod, and Kreuznach. Some others contain a little bromine, and a few contain both iodine and bromine.—*Tomlinson*. See Hot-springs; Mineral Waters; Springs; Thermal springs.

WATER-OUSEL. The brown water ousel, Cinclus asiaticus, is very generally distributed on the streams of the lower and middle Himalaya regions; its habits and haunts closely resemble the European dipper, likewise found on the Cashmere mountains, from which it differs only in colour, being a snuff brown.

WATER SNAKES. See Reptiles.

WATERSPOUTS are frequent in the Indian Ocean, the Bay of Bengal, and the Arabian Sea. They generally form a double cone. The upper portion with its apex downwards consisting of a dense cloud, while the former cone, the apex of which is pointed to the heavens, consists of water, which is thus sometimes raised to a height of several hundred feet. Water spouts seldom last longer than half an hour. Their course and movements are irregular. They are more frequent near the coasts than in the high seas, yet often the wind prevents the formation of water spouts. In their stead the wind spout shoots up like an arrow, and the sea seems to try in vain to keep it back. The sea, lashed into fury, marks with foam the path along which the conflict rages and roars with the noise of its waterspouts, and woe to the rash mariner who ventures therein! The height of the spouts is usually somewhat less than 200 yards, and their diameter not more than 20 feet, yet they are often taller and thicker. When the opportunity of correctly measuring them has been favourable, however, as it generally is when they pass between islands of the Eastern Archipelago, so that the distance of their bases could be accurately determined, they have never been found higher than 700 yards, nor thicker than 50 yards. In October, in the Archipelago of Rio, they travel from north-west to south-east. They seldom last longer than five minutes, generally they are dissipated in less time. As they are going away, the bulbous tube, which is as palpable as that of a thermometer, becomes broader at the base, and little clouds, like steam from the pipe of a locomotive, are continually thrown off from the circumference of the spout, and gradually the water is released, and the clouds whence the spout came again closes its mouth. There never occur many waterspouts in the Archipelago of Bioun Lingen except during the changing of the monsoon, when almost daily one or more. The air spouts near the equator always appear to be more dangerous than the water-spouts. Mr. Jansen says he has seen water-spouts go up out of the water upon the shore, where they overthrew strong isolated frame houses.

A gentleman, engaged in the Great Trigonometrical Survey, furnished particulars of certain phenomena observed by him during a journey from Dehra Doon to Sealkote in the summer of last year. He attributes the formation of water spouts there to the atmosphere being surcharged with electricity, as for a week previous there had been frequent thunder storms. On the day he took down his notes the temperature had been unusually warm and sultry, rain had fallen after 1 P. M. to the south and north at distances of seven or eight miles, till 5 P. M., when great masses of clouds moving from south to north, accompanied with rain and vivid lightning, accumulated at a short distance to the east of his position. At 5-30 P. M. the great disturbance in the clouds took place; extensive masses being driven together, the waterspouts were first observed descending out of one of the masses from which no rain was falling, and assuming the appearance which they retained for fourteen minutes, after which time the column to the north became small, and the southern one grew larger for about five minutes, when they both assumed the same shape, but got very thin and long; in another six minutes after, they, especially the southern one, lengthened out into a very fine column converging towards each other till the ends nearest to the earth met at a height of two hundred feet from the ground; after this junction the column to the north dissolved, and the southern one assumed gigantic proportions; after which the spout changed its form so rapidly that no correct sketch could be made. When the waterspout attained its largest dimensions it was quickly absorbed up into the cloud with which it was connected, and from which torrents of rain immediately began to fall, accompanied with vivid forked lightning. The ground directly below these water-spouts was greatly agitated, for large and dense columns of vapour or dust—more likely the former, since the soil was still moist with recent rain, rose from the earth till they touched the ends of the waterspouts with which they seemed to mingle. The colour of the waterspouts was exactly alike, viz., light grey with a touch of neutral tint which looked very remarkable against the dark sky beyond. The columns of vapour which rose from the earth followed the same oscillatory and giratory motion as the waterspouts. The time of duration of this phenomenon from its first appearance to its ending was exactly forty-two minutes. The length of the columns or water-spouts at time of greatest convergency was 900 and 1,150 feet, and length of the southern spout when it assumed its largest dimensions was nearly 1,800 feet from the cloud to its extreme end, and their distance from the observer's position was a mile and a half.—*Jansen in Maury's Physical Geography, p.* 247, 250, 384.

WATER WAGTAIL. The little piebald Water wagtail, in its season, and the common sparrow, at all seasons, are identical with those of Europe. The common small kingfisher of India differs from the British bird only in its more diminutive size. See Birds.

WATHAMMAN. Hind. of Salt Range. Celtis caucasia, Nettle tree.

WAT'N. Arab. Hind. Mahr. A native country, amongst the Mahratta, a patrimony.

WATPAN. Hind. Tussilago farfara.

WATPHUTA. Hind. Saxifraga ligulata.

WATSON. Gheriah was the chief town and strongest port of Angria in 1756, it was attacked and taken by a British squadron under Admiral Watson, and on land by an army under Clive; a Mahratta army held aloof.

WATTAL. Hind. Euonymus fimbriata.

WATTAL or Watul, a tribe in Kashmir, a gypsy kind of tribe which supplies dancing girls and prostitutes. The women are among the handsomest of the valley. They have all the manners and appearance of gypsies. They live in tents or rather small huts of thatch, and have no restriction as to food. Their women are very beautiful.—*Campbell, p.* 121. See Watul.

WATTAMAN. Panj. Celtis Caucasia, *Willde.*

WATTLE BARK. See Mimosa.

WATU-KAJU. Sind. Anacardium occidentale, *Linn.*

WATUKARA-PINCHEE-GASS. Singh. Bergera Konigii, *Linn.*; *W. & A.*; *Roxb.*

WAVE-LEAVED BIGNONIA. Bignonia undulata, *Roxb.*

WA-WE. See Kush.

WA-WEI. A vegetable poison used by natives of the Somali coast and others in the interior of Africa, for poisoning their arrows. It is an inspissated decoction of the root of a tree which is not determined, but is supposed by Dr. Cleghorn to be one of the Loganiaceæ or Apocynaceæ. It is used both in hunting and in war, and is said not to be poisonous if swallowed.—*Madras Museum, Captain Playfair.*

Wax is obtained from different sources, the chief of which is the bee-hive, where it is made by the bees for the formation of their cells. The insects proceed in a similar manner and with such celerity, that in a new hive, a comb 20 inches long by 7 or 8 inches broad, will be constructed in 24 hours, and in five or six days the hive will be half filled. The wax thus produced is more or less yellow in colour, and has an odour resembling that of honey. The beautiful geometrical form in which it is arranged in the honeycomb is well known. The amount of wax produced in England is very large, but a considerable quantity is likewise imported from abroad. In 1840, nearly 4000 cwts. were imported from the western coast of Africa, nearly 2000 cwts. from Tripoli, Tunis, &c., and more than 1000 cwts. from the East India Company's territories. This was at a time when the very heavy duty of 10*s.* per cwt. was laid upon this article, and in the years 1847, 1848 and 1849, the imports were 510, 432 and 377 tons. In 1842, the duty was reduced to 1*s.* and 2*s.* the cwt. The adulteration of this substance was great during the existence of the heavy duties, and is still practised to a less extent. The adulterants of yellow wax are earth, pease-meal, resin, &c. Those of white wax are white oxide of lead, white tallow, and potato starch. Oxide of lead may be detected by simply melting the wax in water, when the oxide falls to the bottom; tallow is discovered by the dull opaque white which it gives to the wax, and starch is detected by means of sulphuric acid, which carbonizes the starch without acting on the wax. When the wax has served its purpose in the domestic economy of the hive, it is collected for manufacturing purposes by first allowing the honey to drain off or to be pressed out, and then, by repeated boilings and strainings, obtain the product. For obtaining a marketable wax from the combs by a single operation, without either straining or pressing, in an earthen vessel, much narrower at bottom than at top, is placed water and aqua fortis, in the proportion of 1 ounce of the latter to every quart of the former. When these are well blended, as many good waxcombs are put in as will reach, when melted, to within a finger's length of the top of the pan. The pan is then set on a clear fire, and stirred while the wax is melting, and until it has boiled long enough to liquify the whole completely. It is then removed from the fire, and allowed to cool gradually. The wax then forms into a cake at the top, and the impurities are underneath: these arrange themselves in two layers, the lowest of which consists almost entirely of dross, but the next contains a certain amount of wax. When the cake of wax is turned out of the pan, both these drossy layers are removed, leaving the cake pure; but the upper drossy layer is boiled over again with more combs, and with any scrapings which it may have been necessary to make from the upper surface of the wax in order to leave it quite free from extraneous matters. Old combs that have wax in them or other descriptions of refuse that have been pressed, but yet retain a considerable portion of wax, are pressed down in a close tub or vessel in a house for five weeks. This causes the impurities to ferment and rot, without affecting the wax, which may then be treated as above described, and will yield a fine yellow wax, little inferior to that of the best combs. Where very great purity is required, the best empty virgin combs are put into the same kind of vessel employed in the preceding process, but with only a quarter of a pint of water, to keep the wax from burning. The pan is then set over a clear fire, and stirred until it boils. At this time a clear yellow froth begins to rise up, which froth is to be skimmed off into a pan placed close at hand. The fire must be so managed that this froth shall continue to rise without boiling over, and a succession of skimmings are thus obtained, which form a very pure description of wax. When no more froth will rise, the residue is turned out into a vessel of cold water, and can be boiled up again with other combs. This method is only available with a fine comb. By the above processes, bees-wax is freed from impurities, but is not deprived of its natural yellow colour. For the greater number of uses to which the substance is appropriated, it is, however, necessary that the wax should be rendered perfectly white. This is effected by exposing it in thin ribands on a bleaching ground, where it is subjected to the action of light, air and moisture, and loses both colour and odour. In India, wax is obtained from the West Coast of Africa, Barbary, Malabar, Zanzibar, and in small quantities from the West Indies, United States, Germany, France, &c.—*Waterston, quoted by Faulkner. McCulloch Commercial Dictionary. Tomlinson, Smith Chinese Materia Medica. Poole, Statistics of Commerce. Bagster on the Management of Bees, Lond.* 1834.

WAX CANDLES. Various descriptions of wax candles were formerly made in India, but the manufacture has been discontinued.

WAXEN CHARRAS. See Cannabis sativa, Charras.

WAX FLOWER. Tabernæmontana coronaria, *R. Br.*, also Gardenia florida, *Linn.*

WAX INSECT.

Chung-peh-lah,	CHIN.	Shu-lah,	CHIN.
Peh-lah,	„		

The wax-insect, the Coccus pela, *Westwood*, is of a whitish hue when small, but becomes of a dark brown colour at the close of the season. The male insect has large wings and an elongated anal point. They are found on certain oleaceous plants, Ligustrum japonicum, L. lucidum and L. obtusifolium. It is the secretion of these insects that the Chinese call peh-lah or white-wax. The wax-insect tree of China, erroneously says Mr. Fortune, is no doubt a species of ash (Fraxinus). It grows abundantly on the banks of ponds and canals in the province of Chekiang; and a small quantity of wax is also produced in this province. He was indebted to Dr. McCarter of Ningpo for some beautiful specimens of the fresh insect upon the branches of this tree. This insect, when fully developed on the trees, seems as if covered with flakes of snow. The wax is an article of great value in Chinese commerce, and a small portion is exported. From the time of the Mongolian dynasty white wax is always to be understood in Chinese works as referring to the waxy secretion deposited upon the small branches of several oleaceous trees. The male insect is described in Hanbury's Notes as having large wings and an elongated anal point. The female insect appears to develope its body in such a way as to envelope the twigs of the tree. The Pen Ts'au describes them as about the size of a wood-louse. In the beginning of June they are found upon the small tender branches of the trees, around which they deposit the snow-like wax. In the latter end of August, or thereabouts, the wax, which is an imperial monopoly, is carefully scraped off the trees, is melted in boiling water, strained whilst hot, and poured into cold water, when it immediately congeals into a white, opaque, crystaline mass, very much resembling the best spermaceti. If the collection be delayed the raw wax, called Lah-cha, is inferior. In the autumn the dark chesnut-coloured insect begins to make a nidus, something like that of the mantis. It is at first no larger than a grain of millet, the whole covering the tree something like fruit. As the spring comes, on these reddish round receptacles become as large as a fowl's head. Each one of these insects lays several hundred eggs. At the beginning of May these collections of eggs are gathered, and wrapped in the leaves of a reed called Yoh, the same as the rice-dumplings of the Dragon-boat Festival are wrapped in. They are put upon the proper trees, and by the early or middle part of June, they are hatched and have emerged from the leaves to enter upon their wax-making on the young branches of the trees. The insects have their enemies in the shape of the ants, who climb up the trees and eat their fat friends, unless lime be sprinkled frequently over the trunks of all the wax trees. These trees are planted upon the banks between fields, or in clumps. In the latter case the trees are guarded by soldiers, and a heavy tax is collected, if the wax be not wanted by the government, who claim the right of pre-emption. Lu-chau-fu in Ngaghwui Kia-hing fu, in Cheh-kiang, Hing-hwa-fu in Fuhkien, Li-p'ing fu and Hing-i fu in Kweichau, Chang-teh fu, Kwang-chau ting Tsing chau, Yung-shun fu, Hang-chau fu, Kwei-yang chau, and other places in Hunan, with several districts in Yunnan and Sech'uen are known to supply this wax in large quantities. Since the Taiping rebellion the price of this article has increased to some five or six times its previous cost, although there is some variation in the price. It is sold in large, flat, round cakes, sometimes carried without any packing ; the trade is very extensive in Hankow. The insects and the trees are said to have been, originally, inhabitants of different parts of the country, until attention was directed to the culture of this wax. The wax is beautifully white and crystaline. It melts at about 152°, and is tolerably soluble in alcohol. It dissolves readily in essential oils, but is not much affected by acids or alkalies. There is some difference in the hardness, but it never shows signs of melting in the high summer temperature of Central China. Its composition is that of ceryl cerotate ($C_{27}H_{53}O_2$, $C_{27}H_{55}$). It yields cerotic acid and cerylene by dry distillation. It is used in making candles, when mixed with vegetable tallow, in also very small quantities to harden the outer coat of Chinese candles, is the basis of the black composition used in rubbing off visiting cards, or other simple impressions from small blocks. It is likewise used in making ointments for sores, cuts and porrigo ; a kind of bolus is brought from Canton, called Peh-lah-hwan, and is much prized as a vulnerary and pectoral dose. White wax is used in internal injuries, after accidents, in much the same way as spermaceti was in European pharmacy up to the beginning of the present century. —*Fortune. Smith Mat. Med.* See Wax Trees.

WAX OIL. Oleum ceræ. Bees wax submitted to destructive distillation with the addition of a little salt yields an empyreumatic oil which is much used in medicine by native medicinists.—*M. E. J. R.*

WAX PLANT. Hoya carnosa.

WAX TREES. Several species of myrtle, Myrica, yield the product called **Myrtle-wax.** This is especially obtained from Myrica cerifera, which flourishes in Louisiana, the berries of which are incrusted with wax. By boiling these in water, a quantity of hard brittle wax of a pale green colour is obtained, of the specific gravity 1·015, the fusing point being 110°. A somewhat similar wax is obtained from Myrica cordifolia, a shrub which grows at the Cape of Good Hope. The stems and leaves of palm-trees also secrete the substance called Palm-wax. Such is the hard, brittle, greenish, yellow wax which we obtain from Rio de Janeiro. It is soluble in boiling alcohol and ether ; it fuses at about 163°. A white and crystaline wax, resembling spermaceti, is known in commerce as Chinese or Japan wax. It is soluble in naphtha, but scarcely so in alcohol and in boiling ether. It forms a soluble soap when boiled in a solution of caustic potash. It fuses at about 180°. Another wax, having the same fusing point, is found upon a hard and ligneous variety of the sugar-cane, and is known as sugar-cane wax and cerosine. This is soluble in boiling alcohol, but sparingly so in boiling ether. By boiling the bark of the cork-tree, Quercus suber, in alcohol, and distilling off the alcohol, a quantity of yellow crystals are obtained which form cork-tree wax, which may be purified by repeated solution and crystalization. Nitric acid converts this substance into a peculiar acid, called cerinic acid.

The wax tree of China, called Tung-ts'ing or Lah-shu, is the Ligustrum lucidum, on which the wax-insect breeds. It is a handsome evergreen tree with ovate pointed flowers and black capsular fruit. The insect is also raised in Se-ch'uen on the Nu-ching trees, the L. japonicum and L. optusifolium, and on the Shwai-lah-shu or L. ibota, or species of ulmus. Another tree on which the insect harbours is the Shwni-tung-ts'ing, supposed to be a species of Hibiscus, and a tree called Tien-chu, also called Cau-lih and Pentsau, a native of Kiang-nang, supposed to be a species of Ornus or Fraxinus. The Holly tree, Shwni-Kiuh-shu, and the Yuen-chi-hwa tree are also named as affording shelter to the wax-insect.—*Smith Chinese Materia Medica.* See Wax Insect.

WAX, VEGETABLE. This term has recently been applied to solidified oils. Mr. Edward Loarer lately discovered a mode of fabricating a substance which he named vegetable wax, from its resemblance to that animal product, and he obtained a Patent for it under Act VI of 1856 of the Government of India. He manufactured about 200 tons, all of which has been sold in Madras, Calcutta, and Europe; it brought various prices, but the latest selling price at Havre was about £43 per ton of one thousand kilogrammes, or 2,200 English pounds.

Candles can be prepared of this material; and the power of bleaching it is possessed in Europe. The vegetable wax is made from the common lamp oil (castor oil) of the country, the plant producing which is grown throughout the length and breadth of the Indian empire, springing luxuriantly even on bare rocky soils, affording, therefore, exhaustless supplies of the raw material for the wax.

By one of Mr. Loarer's processes, about 100 lbs. of oil were congealed in 8 hours; only one ingredient (sulphuric acid) was used, and that only in very small quantity, sixteen ounces sufficing for obtaining 100 lbs. of vegetable wax. This process is admirably adapted to the country, and may be adopted by the ryots without any difficulty.

Another process, in which both nitric and sulphuric acids are used, is the best adapted for manufacture on a large scale; by this process 400 lbs. of oil were congealed in a wooden trough in 4 days, and Mr. Loarer suggested an arrangement, and described an apparatus, which would make this process of preparing vegetable wax on any scale, very simple. The manufacture of vegetable wax can be generally introduced into India; thus enabling the grower of castor and other similar oil seeds to carry oil to market in a solid and consequently more portable state: at present the carriage of fluid oils is not only difficult but costly.

The vegetable wax has the advantage of being easily stored, and transported from the interior on the rudest conveyance and in the simplest and cheapest form; it can be loaded upon carts, on bullocks, or in any way best adapted to the habits of the people, and sufficiently protected from injury and from weather by the ordinary leaves and mats of the country, requiring neither casks, dubbers, nor boxes to convey it. It can further be solidified into any portions or shapes, and on board ship can be stowed in any convenient corner; requiring no protection against leakage or bilge water, and by its nature it can be packed so close, that no danger from shifting of cargo or injury to the article from rubbing, need be apprehended.

Mr. Loarer gives the following details of three different processes for the manufacture of vegetable wax. (*a*) The cheapest process is well adapted for villagers, a common earthen pot being the only apparatus necessary.

Take one part of common unrefined saltpetre, and one part of sulphuric acid: mix these at the bottom of a pot of sufficient size, and as soon as the mixture is well saturated, a hundred parts of common castor oil is to be slowly poured upon the mixture, and the whole heated on a slow fire until it reaches a temperature of ¾ that of boiling water or about 160°Faht. (More or less is not the question, provided the oil does not boil). The means for ascertaining the temperature of the oil is with the finger, being careful to stop the fire so soon as the heat will not allow to keep the finger into the oil: the compound is then allowed to cool and may be then decanted into another pot or box made water-tight, and it is then well stirred, when it begins to thicken. This process will last about 8 hours, and the cake will come out of the mould three or four days afterwards, in a hard lump ready for packing into plaintain leaves and gunny bags; square boxes of 18 inches on every side, are the best things for moulding, but at least one of the sides should be moveable, to facilitate the exit of the cake when it hardens. He strongly recommends an active stirring when the paste thickens, as it betters the colour of the vegetable wax. Washing the cakes when they come out of the moulds is very useful for taking away all viscidity—if the cakes are left in the moulds eight or ten days it will be better. The cost of manufacturing a ton of 2,240 lbs. of vegetable wax, not including the price of 2,240 lbs. of oil, is Rs. 4-6, as follows:—

20 pounds of crude saltpetre,...	Rs.	1	4
20 pounds of sulphuric acid,...	„	2	8
Fuel,......	„	0	2
Coolies, working and packing,	„	0	1

Mr. Loarer prefers crude saltpetre to refined nitre, as the former yields by its combination with the sulphuric acid, a notable quantity of chlorine, which has a bleaching property on the wax; more, it is cheaper.

2nd Process. For a large manufacture the above process would become tedious because it is difficult to procure pots of 20 gallons; the pots are very often broken, entailing a great loss in raw materials, and the pots will hardly stand more than eight or ten operations, being very soon corroded by the bi-sulphate of potash formed during the process. For manufacturing ten tons at every out-turn, have a large vat or tub made to contain two thousand gallons, having at two inches above the bottom a number of holes with leaden pipes for drawing out when required the contents of the vat, also an iron retort in the form of a gas cylinder with a hole—in the centre of the cover of the hole is a small aperture half an inch in diameter for pouring in the acid: this small hole may be stopped with baked clay or wood. A leaden pipe connects the still with the bottom of the vat. Many moulding boxes, with one moveable side and moveable diaphragms; distant one from another 18 inches and dividing the boxes into an exact number of cubic cells 18 inches on each dimension. This machinery being ready, the vat being full of oil, the retort will receive a load of seven pounds of crude nitre for every thousand pounds of oil in the vat. The hole must then be well secured and luted and the sulphuric acid is poured upon the nitre through the small aperture, using a funnel with a long neck: the small aperture is luted or stopped, and fire is kindled under the retort. To every pound of crude nitre allow a pound of commercial sulphuric acid. First a slow fire, then a very brisk one should be applied during two or three hours; the oil in the tub will become gradually heated till it reaches 120 to 130° Faht. When the evolution of gas is no more perceptible in the oil, the stopper should be opened and the fire taken out of the grate. The whole is allowed to cool during the night, and next morning a light film much like cream on the top of milk, is perceptible on the top of the oil; it is then time for opening the holes: the liquid is let into the moulding boxes, where it must be actively stirred as it thickens, as long as the magma will allow a strong man to stir it. The diaphragms are then inserted into the moulding boxes and the whole is left to itself for five or six days. The boxes may then be opened, the diaphragms removed, the cakes taken out, washed, allowed to dry for one or two days on platforms, and then packed in plaintain leaves and gunnies.

If the moulding boxes are made of partitions exactly of 18 inches cube, each mould will weigh 225 pounds, ten packages to the ton, and very convenient for stowing on board. The cost of ten tons by the 2nd process is Rs. 18·2.

155 lbs. of crude nitre,...........	Rs.	6	0
155 lbs. of commercial sulphuric acid,...........................	,,	10	0
Firewood, ...	,,	0	8
Coolies, working and packing,.....	,,	1	10

3rd Process. A large vat, square or round, being made of wood or sheet iron, must be supplied with a horizontal or vertical fan; the bottom of the vat must be calculated so as to leave no corner unstirred by the motion of the fan, the bottom of the vat must be well coated with a mixture of vegetable wax and resin to preserve it from corrosion by acids. This being done, the vat is filled with oil and three quarters of a pound of nitric acid is put into the vat for every hundred pounds of oil contained in it. The mixture must be then well stirred by the fan, ten minutes for every two hours, until the oil becomes thick, viz., after three or four days; the composition should then be decanted into the moulding boxes, and there stirred very actively as in 2nd process. This process is very expensive compared to the first and second processes, and should never be resorted to. The product from this process is improved by the addition on the second day of one ounce of sulphuric acid for every pound of nitric acid, poured into the vat the first day; this betters the colour of the wax, and accelerates the result of the operation; but after all, this third process should not be resorted to as long as it is possible to work the 1st and 2nd processes.

Candle making. Candle moulds being prepared in the usual way with wicks and laid into the casting table, the oil prepared by one of the above processes should be cast into the moulds at the precise moment when the composition has reached the consistency of thick congee water. The candles must then be left to themselves in the moulds for five or six days, when they will come out with a fine gloss and a light saffron colour. A very great improvement is obtained in the quality of the candles by passing a current of chlorine gas through the oil during the process of solidification; when that is made with proper care, a threefold object is obtained:—1st. Specific gravity increased and melting point raised. 2nd. Colour much improved. 3rd. The melted stuff never runs when the candle is lighted.

These candles are self-snuffing, a very important item. It is as yet necessary to learn the composition of a good sort of wicks, before bringing these candles to perfection as an article for the million. There was at Calcutta a manufacture of wicks on the French principle, and they sell wicks readily to every one who wants them.

Cost of 2,240 pounds of candles of vegetable wax is Rs. 214-12, viz.:—

4½ candies of oil @ 45 Rs. per candy,	202	8
Working of the oil into vegetable wax, (2nd process), ...	1	12
Additional cost for chlorine, ...	1	0
13,440 wicks at 100 per anna and cooly.	9	0
Other expenses, ...	0	8

Cost to the manufacturer of one pound of candle 1 anna and 7 pie, or at the utmost 2 annas per pound of candle.

Vegetable wax is an excellent lubricator; it was once extensively used on the Madras Railway. Mr. Fletcher, the Traffic Manager, wrote that he found Loarer's grease capital, and they were then using nothing else. It is in any one's power to make it of different degrees of consistency without lessening its high resistance to heat; it will answer when softer for any description of machinery, and will take with a notable economy the place of tallow, so expensive for steam engines. Vegetable wax can be bleached perfectly white, and there was sent to the Exhibition of Madras in April 1857 a box containing some 30 pounds of vegetable wax bleached at Vellore, simply by exposure to the sun and dew, and by keeping it continually sprinkled with water; three days of that treatment being sufficient for bleaching vegetable wax perfectly white. Very good and cheap candles are made immediately from the raw material, and without any chemical preparation whatever. Vegetable wax can be converted into soap, and some tolerable samples of soft and hard soaps have been made. About a hundred pounds of vegetable wax was treated at Calcutta by a manufacturer of stearine candles, and it has been as easily converted into stearic acid as is the tallow by the same process. The produce of tallow compared to vegetable wax was:

Tallow produce, Stearine 55, Oleine 43, loss 2.
Vegetable wax „ 48, „ 48, „ 4.

The manufacturer of Calcutta said that with care and a more complete acquaintance with vegetable wax, he would succeed in bettering the difference of produce between the two facts; the price of tallow at Calcutta varies from 12½ to 14 Rupees per Indian maund. Vegetable wax is a very good substance for the preparation and keeping of all sorts of leathers and hides, such as accoutrements for the army, harness, boots, ropes made of raw hides, &c.; this substance never hardens, and never changes by exposure to the air into a sort of varnish, rendering the leather hard and prone to cut, as is the case when tallow is mixed with oil. At home the tanner will find that stuff to answer as a succedaneum for more expensive oils, such as whale oil now in use. During the last three years Mr. Loarer used nothing else for the harnesses of his horses, and it answered very well. Vegetable wax is the cheapest material to be used for the preservation of all articles of iron of comparatively small value, such as bar iron, steel, engineer's and artillery tools and spare pieces, the inside of guns, grape shot, &c., and in one word all articles of iron kept in store rooms and godowns, where they go to decay in so short a time. Vegetable wax would equally do for round and hollow shot, but for the tremendous heat attracted by the black piles of shot in the arsenals in these tropical climates. It would prove superior to any coating now in use for shot, if the piles were only protected from the heat by the commonest sort of covering; for ships of war, where shot go so rapidly to decay, the composition is capital. From vegetable wax never drying, it will never interfere with the progress of loading a gun, but would on the contrary facilitate its entrance into a foul gun. Vegetable wax being easily made of various consistency with a nearly fixed melting point, varying from 140 to 155° Farht, it is the best thing for greasing the axles of gun carriages and waggons of the artillery, engineers, and land transport corps. The same substance may with great advantage and economy, be substituted in the studio of the statuary and the workshop of the moulder and castors in bronze or brass, to the bees wax which is now very extensively used, and costs about eight times more. A mixture of 8 parts of vegetable wax and two parts of bees wax is superior even to pure bees wax for ductility and evenness of grain. Vegetable wax is manufactured from the coarsest sort of lamp oil (Castor oil, the produce of Ricinus communis.) Castor oil seeds are planted in July in the districts of North and South Arcot, Salem and Coimbatore; the crop is gathered in February. The seeds are sown only on the poorest description of dry land, whose assessment is from 1½ to 3 Rupees per cawny.

In the process for re-converting vegetable wax into oil, the vegetable wax should be melted with water at a gentle heat, (not to make it boil); when the wax is melted, it must be drawn from above the water by a syphon or a cock, and put into a large vat, at the bottom of which there is a layer of bisulphate of potash swimming in a sufficient quantity of sulphuric acid, so as to prevent the oil coming in contact with the bisulphate of potash. The room where the vat is must be kept for 24 hours at a heat of 140° by means of a stove, the heat should be then gradually decreased to 120°, and 100°, and in four days the oil will be perfectly liquid and will congeal no more.

Mr. Loarer experimented on samples of the following oils, viz.:

Illipoo.
Margosa.
Piney cotay.
Kattamanaka.
Wood oil.
Cotton seed.
Mustard.
Rape.
Ramtil.
Soapnut.
Croton tiglium.
Ground nut.
Cold drawn castor.
Cocoanut.
Gingely.

Illipoo Oil produces with great facility a perfectly white substance of the consistency of good tallow. Illipoo oil is with great advantage mixed with castor oil for the manufacture of vegetable wax, and as Illipoo oil has always fetched a very low price in the Madras Presidency, the discovery of this property renders it very valuable, and will enhance its price for the future.

b. Margosa Oil, the oil of species of Azaderachta and Melia, produces a vegetable wax as hard as any made from the best lamp oil, and of a light saffron color. Margosa oil has always been sold in the Madras Presidency at a very low price, but its supply has never reached what it could attain should this oil become saleable. Margosa as well as Ilipoo oil,mixed with an equal quantity of cold drawn castor oil, produces a hard vegetable wax of an agreeable roseate color.

c. Wood Oil is decomposed by nitric acid into a black spongy substance, hard and brittle, heavier than the liquid part of the oil into which it sinks : the liquid part assumes a color nearly like that of port wine, and is about as fluid as water, much more liquid than the natural wood oil. A thin coating of that liquid part applied to a board of deal wood formed in twenty-four hours a transparent varnish perfectly even and bright ; the spongy matter above alluded to seems to possess the same properties as a mixture of resin and anotto. He obtained two identical substances by dissolving with nitric acid the common asphalte used for pavements. A small quantity of sulphuric acid poured uncautiously on the second day into the wood oil which had been in contact with nitric acid caused it to rush out of the glass with a violent effervescence and disengagement of smoke, aromatic fumes, and a heat of about 200° Fah. ; the aromatic smell was very sweet, and much like benjamin. He thinks the wood oil worthy of great attention on account of the varnishes it can supply.—*Mr. Loarer's Report to Madras Committee, reporting on the Resources of India.*

WAYALAKUL. Tel. Vitex negundo.

WAYANG. See Karang Bolang.

WAYGIOU, called Quarido by the inhabitants, an island in the Gilolo Passage, is mostly high uneven land. It has several well sheltered harbours, the most westerly of which, Piapis, is in lat. 0° 5′ S. See Wygiou.

WAZARAMO. See Somal, Beer-el-somal.

WAZEEFA. Ar. a stipend. See Khiraj.

WAZIRA, a brave, active, warlike, but aggressive and predatory race in the mountains on each side of Bannu and Dour. They occupy all the hill tract, from Koorum and the Miranzye to the Gomal and Galeri Pass south of Tak. They hold both sides of this pass, which is the great route by which the trade of Afghanistan and Central Asia passes into India. Between the Miranzye and Bannu valleys, the hills of the Waziri project into British territory and approach the Bahadur Kheyl salt mines from which they are separated by the Latammar pass. It embraces numerous tribes arranged into the Ahmedzye and Othmanzye, who are estimated to muster 20,000 men. They have made repeated inroads on the Bannu valley, and in the cold weather of 1859-60, an expedition scoured their valleys to coerce them into submission. They are still however more or less independent. The Wazeeri are divided into three great divisions, or Usman kheyl, Ahmedzye, and Mahsood. Their country extends from the south of the Kohat district down to Tonk, opposite Dera Ismail Khan : towards the north they are bounded by the Afreedi country and towards the south by the tribe of Badranian ; Bunnoo frontier is the habitat of the Ahmedzye. These are divided into six sections, which again are sub-divided into numerous smaller clans. One of these sections is called Sperkye ; it has two divisions, the smaller of which goes by the name of Mahomed kheyl, and numbers about 250 fighting-men ; they live in the hills on both sides of the river Koorum, and, since A.D. 1850, a number of them settled in British territory. They till their lands in the cold season, and during the summer months the greater portion of them retire to the hills, leaving a few to look after their fields. The other sections of the Ahmedzye are located in British territory, on the Thul between Bunnoo and Luttumur : they generally go by the name of Thul Wazeeri. The Waziri country in its southern part, has the lofty mountain Kussai Ghar, of which the Takht-i-Suliman is the highest peak. The Waziri, although notorious robbers, in common with other lawless tribes, regard the descendants of Mahomed with awe, and a feeling of respectful reverence, and esteem themselves fortunate to receive their benediction, and other little aids their superstitions teach them to think essential.—*Masson's Journey. vol* i. *p.* 101. *Vigne's, A Personal Narrative, p.* 83. *Our Punjab Frontier.* See Afghan, Khyber, Punjab.

WAZU. Ar. Hind. Pers. The mahomedan legal washings of the face, hands and feet. The mahomedan purification before prayers. See Ablutions, Bathing.

WEASELS. Of these there are several species in India ; they are arranged by naturalists under the genus Mustela of the family Mustelidæ, and there are known M. kathiah, *Hodg.*, the yellow bellied weasel of the Himalaya and Nepaul ; M. strigidorsa, *Hodg.*, the striped weasel of Sikkim ; M.Horsfieldii, *Gray*, of Bootan ; M. temon, *Hodgs.*, of Tibet ; M. canigula, M. nudipes, *F. Cuv.*, of the Malay peninsula and Java ; M. sarmatica, *Pallas*, of N. and Central Asia and Afghanistan. Mustela subhemachalana, *Hodgson*, the Himalayan weasel, occurs throughout the Himalaya from Kashmir to Darjeeling. Its total length, in cluding tail, is 19 inches; colour, a uniform light-brown, darker on the back; nose, mouth, and throat, white; tail lax and tapering. This handsome little creature is not uncommon in the valley of Kashmir. M. erminra, the stoat or ermine, is stated to occur in Nepal and in the lower and middle regions of the W. Himalaya. M. sibirica, *Pallas*, occurs in China.—*Adams. Jerdon.*

WEATHER. From 50 years observations at Florence and in England, the following was found to be a law. Eleven times out of twelve, the weather remains the same during the whole moon as it is on the fifth day if it continues unchanged on the sixth day; and 9 times out of 12, like that of the fourth day, if the 6th resembles the 4th. Marshal Bugeaud, from 1815 to 1830, acted on the above. In counting the fourth and sixth days, he was particular in beginning from the exact time of new moon, and added three quarters of an hour for each day, for the greater length of the lunar as compared with the solar day.

WEAVERS. Divisions of the weaver caste in Tilingana are Pursala wanloo, Sumsala wanloo, Puttanasala wanloo, and Sala wanloo.

WEAVER BIRDS of India are of the genus Ploceus. P. baza hangs its pendulous dwelling from a projecting bough, twisting it with grass into a form somewhat resembling a bottle with a prolonged neck, the entrance being so invented as to baffle the approaches of its enemies, the tree snakes and other reptiles. Its large purse-shaped nest would fall an easy prey to its enemies did not the little architect, with surprising intelligence, place it in situations not easily accessible; hence several may be seen suspended from the tips of branches overhanging deep wells, or on the topmost boughs of acacia and thorny trees. The weaver-bird builds in societies, and is docile and familiar in its habits.—*Adams' Naturalist in India. Tennent's Sket. Nat. History, p.* 251. See Birds.

WEBB'S FIR. Abies Webbiana, *Hooker.*

WEBERA CORYMBOSA. Willd.

WEIGHTS AND MEASURES. An almost infinite variety of nominal measures, and of varying values given to the same measure, exist in different parts of India and even in the same district. Even in a single village a certain nominal measure will have half a dozen different values, according to which of as many different articles on the floor of the vendor in the bazaar is about to be sold. It is a very general custom that there should be two series of weights employed in each shop according to the transaction. When the shop-keeper sells, he uses a maund of 24 lbs, but when he buys, this weight makes way for another of the same name of 28 lbs. The variation of the Podhee of cotton in Tinnevelly and Madura from 240 to 280 lbs., according to the locality, affords the opportunity dishonestly to employ either, and yet to point to the published market value as a triumphant defence of their terms. Cotton is sold in Madras in candies of 500 lbs., but in many of the cotton districts the candy is but 480 lbs. to the ryot; in Mysore, the same name represents 560 lbs., while in Pondicherry it sinks to 517 lbs., omitting fractions, and rises in the purchases of the merchants to 562 lbs.; while, as if further to complicate this unfortunate measure, brass, copper, and zinc are valued according to candies of 450 lbs. In Candeish, tael seed is sold by the candy of 560 lbs., mustard seed in Guzerat is measured by the candy of 612 lbs., while 580 lbs. is the value for mustard seed in Sholapore, and the territory of Goa measures its Kokum by the candy of 784 lbs. Cotton seed from America, priced here by the hundred weight of 112 lbs., is sold to the natives by the maund of 25 lbs. The merchant buyer sells it to the shopkeeper in maunds of 28 lbs., and he disposes of it to a ryot who calls 24 lbs. by the same name, while the latter gives a portion to his neighbour in toolams of 62½ lbs. The coffee grown in Mysore is estimated in maunds of 28. lbs.; if bought by a Madras merchant, it is priced in maunds of 25 lbs.,—and transmitted to him by railway in maunds of 82 lbs.; but if bought for export from Calicut, it must be in maunds of 30 lbs. each.

Matters are just as bad between the various Presidencies. The ordinary Madras maund is 25 lbs., in Bengal it is 82 lbs.; while in Bombay it is 28 lbs.; in some parts of the western coast of the Madras Presidency 30 lbs. is the value of the same nominal standard; while the indigo and other factory agents of Bengal reckon by a maund of nearly 75 lbs. In Bombay the bazaar maund may contain 40 or 42 seers, while the candy may contain either 20, 21 or 22 maunds, and varies in weight from 500 to 560, 588 or even 616 lbs. In Surat and its neighbourhood, the maund may contain either 40, 41, 42, 43½ or 44 seers according to the articles sold, or whether the transaction be wholesale or retail; and further, these seers themselves differ so much in value that while the maund of 40 seers weighs 31 lbs. avoirdupois, that of 41 seers weighs 38 lbs.; that of 42 seers only 39 lbs.; that of 43½ seers weighs 44 lbs., and that of 44 seers only 41 lbs.! In Travancore the maund is 32 lbs. In Cuttack salt is sold in maunds of 100 lbs.; the duty is paid in the Punjab on maunds of 80 lbs., and in Calcutta of 82 lbs.

In the various parts of Bengal and the North Western Provinces, the variations of the values ascribed to ordinary measures are almost incredible. The unit of measurement is the tola or weight of one rupee—a very simple standard, which all might understand, if the rupees referred to were not of different weights. In many places it is the sicca rupee, in others the Furruckabad rupee, which we believe was the same as the present Company's rupee; other places employ the Benares rupee as their standard, which in the remoter districts gives way to the Balasore rupee, and this in its turn to that of Sonaut. This variety is accounted for by the fact that the natives use the same standards as when they were under their own rulers, each of whom coined his own money; and that no fancied benefit might accrue to his neighbours, each rajah purposely chose an independent standard both of weight and quality. With the extinction of the native princes their peculiar coins gave way to the Company's rupees, and have themselves become great rarities, so that infinite opportunities are given for cheating on the part of merchants and shopkeepers by the all but impossibility of obtaining a comparison with the original standard. As if these variations were not sufficient to deprive the ignorant buyer of all means of self defence, we find that every talook almost has different numbers of these talook units; and within the limits of each an independent system for each article. In Azimgurh, for example, cotton and spice are measured by the seer of 80 tolas, ghee and salt by the seer of 95 tolas, while 96 tolas forms the rate for corn, sugar and tobacco; the merchants themselves employing for their own purchases seers of 105 and 108 tolas. In Malda the seer has no less than fifteen different values. As a sort of national curiosity, we will venture to give them all—50, 58, 60, 72, 75, 70, 80, 80½, 91, 92, 94, 96, 100, 101 and 105 tolahs. In Dacca the relative values are 60, 70 and 82 tolas. Bhagulpore boasts of six different seers of 64, 67, 80, 88, 101 and 104 tolas respectively. The merchants of Juanpore employ in their own dealings a seer of 112¾ tolas, but retail to the people in seers of 80 and 96 tolas.

From these remarks it will be apparent that a greater degree of confusion could not possibly exist, nor greater hindrances to internal trade and prosperity. Those large transactions of English merchants, by which the prices of any commodity are equalized throughout Great Britain, by supplying the wants of one place from the abundance of another, are here rendered impossible by the infinite difficulty which must be experienced before the local rates can be compared. It does not by any means follow that because the market rate of any article at one station is 30 Rupees the maund, and 60 Rupees at another, that a profit will be the result of sending a supply from the one place to the other. The maund in the latter place may contain 40 seers of 70 tolas each ; while in the apparently cheap locality it may be but 30 seers of 45 tolas each, and thus the price be absolutely higher than in the first. Nor can the relative values be compared, for the variations are so numerous and arbitrary, that an agent would be required in each village, to whom careful reference would have to be made in each transaction, an arrangement which would entail ruinous expense and delays. As an example of what must follow any rash attempts at comparative valuation, we may mention that so good an authority as Dr. Forbes Watson seriously states that in Jubbulpore excellent wheat may be obtained at *twopence the bushel,* because, in their report upon a sample sent to the Exhibition of 1862, the local committee observe that it is sold at so many seers the rupee. They referred to the small retail seer of the Jubbulpore bazaar, while Dr. Watson supposed that they referred to one of the very much larger seers in use in other parts where he gained his experiences, and hence his very curious mistake. With the exception of the weight of the Rupee, 180 grains, there exists no defined standard of Weight or Measure in India. There are certain traditionary standards, but these differ all over the country, and in practice are not adhered to, nor is there any law on the subject, by which the gross irregularities that prevail can be checked.

The unit of *Linear* measure in India, is generally the distance from the elbow to the tip of the middle finger of a tall man. This length is known as the *hat,* Hind., or *moolum,* Tam., *mora,* Tel., and averages 19½ inches. It is always translated *cubit,* though invariably exceeding the English cubit of 18 inches, by 1½ or 2 inches. In the Southern Carnatic, the *adee* or length of a tall man's foot, is in use, and averages 10¼ inches. The *Guz* of India, (translated *yard,*) is partially in use all over India, but varies in different localities from 26 to 36 inches. In Bombay it is 27 inches, and in the North-West Provinces of India it has been defined by Government for the purpose of Survey, at 33 inches. Although the above are the *Indian* linear measures, the English yard and foot are very extensively adopted by native artizans ; and in all the Public Works of India, which give employment to thousands of natives, the English linear measure is invariably employed. Considering therefore that this measure is already so familiar to the people, and that their own is so undefined, and fluctuating in practice, there can be little doubt but that the English Yard and Foot should be determined on in a new Metrical system.

Superficial measure need only be noticed in connection with *Land measure.* According to the ancient Indian practice an area of land is often named after the quantity of seed required to sow it, or the quantity it will produce, and of course the actual area differs according to the opinion of the person who makes the estimate. Where linear definition is given, mention is made of Rods or Ropes, of so many cubits, but the cubit is undefined, and areas of the same denomination are derived from different multiples of the Rod or Rope. Of the more definite terms the *Bheega* prevails in Bengal and the North-West Provinces. In Bengal it is 1,600 square yards, and in the North-West Provinces it is 3,025 square yards. In the Bombay Presidency it is not authoritatively defined, but averages about ⅗ of an acre. The term is quite unknown in the Madras Presidency, where the authorised measure is the *Cawnie* of 57,600 square feet, or 1·3223 acre ; there are, also, other local land measures defined, but presenting great differences one from the other ; as the *chain* of 3·64 acres, the *seed-cottah* of 1·62 acres, the *vaylie* of 6·6 acres, and the *bullah* of 3·82 acres.

The greater portion of the North-West Provinces of India has been surveyed by Government officers. The area of each village (or rather parish, to use an English term) is given in Imperial acres, but the areas of the *fields* appertaining to each village, are given in local *bheegas.* The introduction of the acre, therefore, was only partial. In the surveys lately made in the Bombay Presidency, the area of each field is recorded in acres, not only in the English, but in the vernacular acounts, and the term is well known and understood among the people. In the Madras

Presidency, the districts of Bellary and Cuddapah were measured field by field (as far as the land was cultivable) in acres, in 1803, and Kurnool in the same way in 1842. In Salem, the records of field measurements made about 1800, are entered both in the native terms and their equivalents in acres, and the acre is by far the best known.

Under the above circumstances, the introduction of the Imperial acre seems not only most desirable, but quite feasible. Where lands have already been *accurately* measured, and contents recorded in native terms, those terms might be converted into acres; and in the progress of the surveys now going on, all measurements might be at once in acres. This plan has already been successfully adopted in the present re-survey of the southern districts of Madras, and the acre is superseding the *cawnie.* In the new survey now in progress in the Madras Presidency, acres and hundredths of acres are employed.

With regard to the *subdivisions* of the acre, they have hitherto in the Madras Presidency been in 40ths (or Goontas), and 16ths of 40ths; or else in 16ths (annas) and 4ths of 16ths. Where the natural fractions of halves and quarters are not employed, a decimal subdivision is most desirable; not only is the computation far easier to the surveyors, but records in decimals are far more intelligible than in Roods and Perches, and money values in relation to areas more easily calculated. The areas recorded in the Ordnance Survey of Great Britain, in which Survey every field is measured, are now in acres, *and decimals* to the third place. There cannot be a better authority for a decimal subdivision, and it offers no difficulty to the natives as regards *land* measurement. It is hardly necessary to argue why a decimal subdivision of *Land* measure should be easier of introduction than a decimal arrangement of Weights and Measures in general. It is, in practice, a mere division of account. In England not one person in a thousand is the least put out by the substitution of decimals for Roods and Perches: whereas, not one in a thousand but would be inconvenienced (for a time) by the substitution of 10ths of Gallons for Pints, or by Ounces of ten to the Pound. The cawnie itself is in several districts in the Madras Presidency, subdivided into 100ths, and in the present re-survey of the southern districts of Madras, the decimal subdivision of the acre has been authorised, as stated above.

The larger weights throughout India are utterly devoid (in practice) of rule or uniformity, being generally misshapen lumps of metal, or stones, and varying in value as well as denomination in every district almost. The traditionary and acknowledged unit of weight is generally the Rupee; thus the "Seer" is said to be so many Rupees weight; but it is very seldom possible to say what was the weight of the Rupee forming the original unit. The Rupees of the different native governments varied considerably, and even under the British rule the Sicca Rupee of Bengal was 192 grains, when the Arcot Rupee of Madras was 176½. These differences in the small unit would effect the larger ones considerably, and aggravate the uncertainty as to what was their original and real value. Besides this, terms of the same denomination do not by any means denote the same value. A candy (Khundee) for instance, in one place differs very much from the candy of another place. Again, a candy, for instance, of metal, is not the same as a candy of tobacco; and there is a different candy for cotton and sugar. The candy used in buying is not always the same in the same place as the candy used in selling. There has, however, from time immemorial been a small weight called a *tola,* in use by goldsmiths and jewellers, which has maintained a ponderary value of about 182 or 184 grains. The Furruckabad rupee used in the N. W. Provinces, had hitherto been 180·234 grains. The Rupee of Madras and Bombay had been for some years 180 grains. The "Sicca" Rupee of Bengal still remained at 192 grains, but this coinage was discontinued in consequence of Act XVII. of 1835, and since that date the Company's Rupee of 180 grains has been the only Rupee coined at any of the Government mints. When the Government of India, by Act VII. of 1833, (the main purport of which was to fix the weight of the Furruckabad rupee at 180 grains) decided on 180 grains as the *tola,* they in the same Act declared that this tola should be "the unit" of a general system of *Weights* in all *Government transactions."*

The "Table" of Weights adopted by the Government of India for the use of their own offices, is in accordance with native usage in Bengal, and was approved of by the Chambers of Commerce in Calcutta and Bombay. It is as follows:

1 Tola = 180 Grains.
5 Tolas = 1 Chittak.
16 Chittaks = 1 Seer = 80 Tolas = 2·075143 lbs. avoir.
40 Seers = 1 Mun=(or maund)= $82\frac{2}{7}$ lbs. exactly

If any system of weights be selected from those now current in any part of India, the above seems to be the best, not only because it is founded on a *defined* standard, originating in the weight of the coin of the realm, but because it includes the "Seer" of 80 tolas, which is a weight known and acknowledged in *some* degree all over India. It is in short a Ponderary system which as far as *facility of* *introduction* is concerned, has a preference over any other.

In the 140,000 square miles comprised in the Madras Presidency, not a single bazarman has altered his weights one grain, or his measures one fraction of a cubic inch in consequence of the Calcutta notification. Neither was the Act intended to go farther than legalise the tola as a *unit*. The "Table of Weights" has never been adopted in the Madras Presidency, even in *Government transactions*. In the Fort St. George Gazette of the 20th October, 1846, the following Table of Weights was published as that which was to be used in that Presidency:

180 Grains = 1 Tola.
3 Tolas = 1 Pollum.
40 Pollums = 1 Viss = 120 Tolas = 8·0857 lbs. avoir.
3 Viss = 1 Maund = 960 Tolas = 24·6857 lbs. avoir.

This "Table" was sanctioned for Madras by the Government of India, and is, as will be seen on comparison, entirely different, with the exception of the tola unit, from the weights adopted for Calcutta.

It will be observed that the Madras Government Table does not acknowledge the "seer" weight at all; but still a seer weight of 80 tolas, known as the "pucka" seer is met with all over India. This quantity is not much in use in Southern India, where the "seer" of 24 tolas called the "cutcha" seer, is more common. The original unit of weight in Southern India seems to have been the gold coin called by the English a "pagoda." It is now uncurrent, but was about 52½ grains weight. 80 pagodas weight is, according to the Native Tables, a "seer" (cutcha) of 24 rupees weight. This corresponded with the average weight of the old native rupee of 175 grains; but since the introduction of the "Company's rupee" of 180 grains, the "pagoda weight" is 54 grains generally. The same confusion formerly existed in Bengal, between a Sicca weight of 179⅔ grains, and a Sicca rupee of 192 grains. There are also "seers" both in Madras and Bombay, of 84 Rupees weight. Still, a seer of 80 tolas could no doubt be more easily introduced throughout India than any other weight.

The Calcutta official "mun" or maund, is $82\frac{2}{7}$ lbs, avoir., and is not known in any part of the Madras Presidency, except at the Government Salt Depôts, and in the coast trade of grain to the port of Madras. The Madras maund is 25 lbs; the Bombay maund is 28 lbs.; and the Surat maund in use on the Western Coast is 31¼ lbs.

The chief objection to the Ponderary system enunciated by the Government of India, is that it cannot be made to accommodate itself to the Imperial Weights of Great Britain, and this, considering the importance of the trade between the two countries, and the fact that one is a dependency on the other, is a serious drawback.

The following Table shows the nearest proportions that can be obtained, for converting the above system of weights to those of Great Britain (avoirdupois).

38·889 Tolas = 1 lb.
350 Tolas = 9 lbs, *exactly*.
1 Seer = 2·057143 lbs.
35 Seers = 72 lbs. *exactly*.
1 Mun = 82 two-seventh lbs. *exactly*: (82·2857143.)
7 Muns = 576 lbs. *exactly*.
49 Muns = 36 cwt. (of 112 lbs.) *exactly*.
27·216 Muns = 1 ton (of 2240 lbs.)
490 Muns = 18 tons *exactly*.
300 Muns = 11 tons (strictly 11·0204.)

It will be seen that under such a system, there will always be difficulty and confusion in adjusting the weights of articles of commerce to the English Table, and as the connection between the two countries increases, and the European element becomes more marked, the inconvenience will be more practically felt.

Mr. Prinsep, in his "Useful Tables" gives a list of some 300 Rupees of Native Mints, mostly of dates prior to any regular coinage of the Indian Government. They average about 175 grains; and had the Government adopted 175 grains instead of 180 for the rupee, a "Seer" of 80 rupees would have been exactly 2 lbs. *avoirdupois*; and a "Mun" of 40 seers, exactly 80 lbs. *avoirdupois*, and 25 Muns exactly 2,000 lbs., or the proposed new *Ton* for Great Britain. The rupee of 180 grains is *now* so well established in all the Presidencies, and there is such an enormous silver circulation in India, that it seems impracticable to reduce the Rupee to 175 grains; and if the same content of pure silver were retained, (which would be necessary for the credit of the State) the "touch" would be raised from $\frac{11}{12}$ or ·91666, to ·942, which may be deemed too high for durability. The touch of silver in France (where, as in India, it is the legal standard of value) is ·900. In England it is ·925.

Mr. Bayley proposes a "seer" of 77¾ tolas, instead of 80. As far as the facility for testing doubtful weights by the coin of the country, this would answer as well as 80 tolas, for a quarter rupee is just as much a coin of defined weight (45 grains) as a whole rupee, and where one can be obtained, the other can. This "seer" would differ 2¼ tolas weight from the one adopted for Government transactions in Calcutta, but practically the "seer" weights in India, even though professing to be 80 tolas weight, are seldom so much. The seer is generally said to be so many rupees weight, and as the rupees of former days, on which these seers were founded, averaged about 175 grains, the original weight would be more nearly obtained by a "seer" of 77¾ tolas. Besides, as has already been stated, the 80 tola "seer" is not universal, the "seer" weight varying in different localities; and to substitute a 77¾ tola weight in these localities would not be more of an innovation than substituting a "seer" of eighty tolas.

The "seer" of 77¾ tolas would be only 5 grains short of a double pound, or two pounds avoirdupois; that is, it would be 13,995 grains instead of 14,000; which would only make a difference of 1·42 lbs in a proposed new ton of 2,000 lbs, a difference within the limits of error in weighing. It would be advisable perhaps to define the "seer" legally, as equivalent to two avoirdupois pounds; and it might at the same time be declared that a seer of 77¾ tolas weight would not be condemned as short.

The Government of India neither in Act VII of 1833, nor in the "Table" set forth by them, made any allusion to measures of capacity, although it is matter of more importance than the weights, seeing that by far the greater portion of the domestic transactions in India are in grain. The Calcutta Chamber of Commerce, when on the 19th of May 1836, they resolved to adopt the weights of the Government, urged the introduction of the imperial gallon for liquids, and proposed that new measures of capacity for grain should be regulated by the weights; but they did not show how this was to be done, nor does it seem at all necessary to make a distinction between "dry" and "liquid" measures. The Government declined to act on the recommendation of the Chamber, and whatever might have been contemplated by Act VII of 1833, nothing has ever been announced by way of defining the capacities of the grain measures in Bengal. The only measures made up at the Mint by authority of the Government, are the imperial gallon and its submultiples, for use in the medical and victualling departments; but the Court of Directors in their Despatch of 17th July 1833, expected the "general adoption in India" of the imperial measures. The *Madras* Government however, in their Notification referred to above, promulgated a table of measures to be used in Government transactions, as follows:

1 Ollock = 12½ cubic inches.
8 Ollocks = 1 Measure (Puddee) = 100 cubic inches.
8 Measures = 1 Marcal = 800 cubic inches.

And this arrangement was sanctioned by the Supreme Government for the Madras Presidency. But these measures have not been adopted by the people, and even in the town of Madras, the Government have authorised the stamping with the Government seal, the "customary" measure or puddee of 104½ cubic inches, which has been the *real* standard since 1802.

The Bombay Government attempted to introduce a "Seer-measure" of the capacity of 57 cubic inches, but this being so much smaller than the usual "Seer-measure" of that Presidency, the scheme has not met with success.

Mr. James Prinsep's observation that "India does not, properly speaking, possess dry or liquid measures, and that where these are employed, they depend upon, and in fact represent, the "seer" or "maund" *weight*," is true of India generally, but in the neighbourhood of Madras and in some of the southern districts, the ordinary grain measure is a "puddee," which does not represent any weight; and the "puddee" varies greatly in different localities.

The most common grain measure, and one which is to *some* extent known in almost every part of India, is the "seer-measure;" this is always understood to be a measure which, *when heaped*, will contain a "seer" *weight* of rice, or in some places instead of rice, a mixture of the 9 most common grains, known as the *nou-daniam* measurement. The nine grains used in the Madras Presidency are rice, chenna, cooltee, pessaloo, minamaloo, dholl, anamaloo, gingely oil-seed and wheat. As only *heaped* measure is recognised by native usage, it is evident that there is no rule as to the *cubic contents* of the measures used; for vessels of very different cubic contents may contain the same when heaped, in consequence of having different diameters. It is on this account that the values given to Indian measures, in such tables as those of Major Jervis or Dr. Kelly in his Cambist, being founded on the guaged cubic contents, do not represent the true quantities.

In 1852, the Madras Board of Revenue instituted a special enquiry into the grain measures of each district. They were found to be of all shapes and materials. Some were in the form of hour glasses; some were joints of bamboo, and some earthenware pots; but as a general rule, it was found that they were in most districts intended, when *heaped*, to contain a seer weight, or a definite number of seers, either of rice or of mixed grain, but usually rice; and the "seer" weight was generally that of 80 tolas. Measures in every district were guaged with water, rice, and cooltee or horse gram, and it was found that (taking 100 cubic inches of water to weigh 140 tolas, which at a temperature of 81° is true to ½ a grain) rice on an average weighed 113 tolas to the 100 cubic inches. In the Northern Districts, it averaged 111 tolas; in the town of Madras 114, and in the other districts 112 and 113. The rice used was what is called in Madras, "Pucha arisee, TAM.," Kucha Chawul, HIND., or raw rice, to distinguish it from "Poolungul, TAM.," Oobala Chawul, HIND., or that which is scalded before husking. Old rice would weigh something lighter. In experiments made by Mr. Bayley he found 100 cubic inches of the 9 mixed grains, to weigh 115 tolas. From the reports of Mr. Shaw, of Ahmedabad in the Bombay Presidency in 1849, it appears he found that a measure 137½ tolas of water, hel ien struck 114⅔ tolas of mixed grain, v ı gives 116½ to 100 cubic inches ; and M ;eeves, of Poona, ; 80 tolas weight .s of mixed grain, which also gives 116½ tolas to 100 cubic inches. Cooltee or horse gram was found by the Madras experiments to average 116 tolas to 100 cubic inches, but it varied from 113 to 118.

From the same experiments the weights of the *heaps* (of rice) on various diameters were determined as shown in the margin ; but it is probable that the dealers in the bazaar would not heap quite so liberally. The accuracy is of course not so great but that the diameter may be considered either the inner or outer.

The best " Seer-measures" are about 3½ to 3¾ inches in diameter, and 6 inches deep, but they are never true cylinders. Their cubic contents are from 66 to 66½ cubic inches, holding from 74 to 75 tolas of rice when *struck*, and 80 when heaped. It so happens that a vessel of 66$\frac{1}{10}$ cubic inches capacity will contain at a temperature of 84° (a good *day* temperature for India,) 16650 grains, or *exactly* 92½ tolas weight of water. This would hold on an average when *struck*, 74½ tolas weight of rice ; and with a diameter of 37 inches, 80 tolas if *heaped*. Thus if a seer" of 80tolas be adopted, such a measur vould be exactly what is understood by the natives of the country to be a " Seer-m ıre."

The sub-multiples of the " Seer-measure" are generally (not always) used for *liquid* measures in India. The onl liquids sold by measure, are ghee (clarified butter), oil, and milk. No defined measure ı used for arrack and toddy (intoxicating liquors), and spirits in Madras are sold by the " dram" of 5·775 cubic inches, or $\frac{1}{40}$th of the old wine gallon.

Instead of making 40 " seer-measures" = 1 " Mun-measure," which might cause a confusion in the terms of weight and measure, (and the term mun or maund is not in use as a grain measure in Southern India,) it would be better to give some name to a quantity represented by 100 seers. This might be called a " Saotee," from *sao*, a hundred. The " table" adverted to above would be as follows :

DRY AND LIQUID MEASURES.

Seers.	Cubic inches.	Tolas of Water.	Tolas of Rice when struck.	Tolas of Rice in heap.	Total weight.	Diameter inches	Depth inches.
I.	61·1	92½	74½	5½	80	3·7	6 2
II.	123·2	185	149	11	160	4·5	7·7
III.	198·3	277½	223½	16½	240	5·3	9·0
IV.	264·4	370	298	22½	320	5·7	10·3
V.	330 5	462½	372½	27	400	6·2	10·9
VIII.	528·8	740	596	44	640	7·3	12·8
X.	661·0	925	745	55	800	7·7	13·0

LIQUID MEASURE.

½	33·0	46¼				3·0	4·7
¼	16·5	23⅛				2·5	3·4
⅛	8·25	11$\frac{9}{16}$				2·0	2·6

Mr. Bayley proposed as a measure of *capacity*, a vessel to be called a " Seer," but exactly equivalent to an imperial quart. The present " seer-measure" averages a capacity of 66½ cubic inches : the quart is 69·3185. The present "seer-measure" contains, when *struck*, about 74 tolas of rice, or 76 of mixed grain, and about 80 tolas of either when heaped : the quart would contain 78 tolas of rice, or 80 of mixed grain when *struck*, and (with a diameter of 4 inches) about 86 tolas when heaped ; but heaped measure should not be recognised by Government. He thinks that as there exists an English measure which corresponds (taking *struck* contents) so closely to the native " seer" of 80 tolas, or to the " seer" of 77¾ tolas which he has proposed, that it should be adopted, whichever of the two " seers" of *weight* the Government may select. It is also to be added, that the quart will contain an even number of tolas (rupees) weight in water ; namely, 17,460 grains, or 97 tolas *exactly*, at a temperature of 84° Fahrenheit. This may be calculated from the former table.

The " Seer-measure" then would be defined as a vessel containing 97 tolas of water at a temperature of 84°, and its bulk 69·3185 cubic inches. A reference to the water being *distilled* or the height of the barometer, will not be necessary in practice. The barometer in the tropics fluctuates very slightly, and a fall of 1 inch, due to an elevation of about 940 feet, would only make a difference of ·615 grain, to be deducted from the normal 97 tolas assigned to the quart-seer.

It would not be necessary, if the Government recognized *struck* measure only, to define the diameters (or even the shapes) of the vessels of capacity, for all that is required is that they shall contain a certain number of tolas weight of water. Still, for uniformity's sake, and the more easy discovery of fraud, the vessels should be cylindrical, and it would be desirable that the models, as well as all vessels made up under Government orders, should have a diameter proportionate in some simple ratio to the depth. The diameter the same as the depth would be the best, but those who are accustomed to measuring grain and salt, assert that this would be too broad to be convenient, and a diameter one half the depth too narrow. A good proportion is that of 3 to 4, and the contents of a cylinder being given, it is easy to compute the requisite diameter and depth.

Let s = cubic contents given.
d = diameter to be found.
h = depth to be found.
3 : 4 = diameter to depth.

Then [I] $d = 3$

$$\sqrt{\cdot 7854 \times \tfrac{4}{3}} \quad \sqrt{1\cdot 0472}$$

And [II] $h = \dfrac{s}{d^2 + \cdot 7854}$

From these formulæ, we obtain the following table for both *Dry* and *Liquid* Measure.

Quarts.	Tolas water at 84°	Cubic inches.	Diameter in inches.	Depth in inches.	Tolas Rice. 113 tolas to 100 cub. in.
I.	97	69·3185	4·04	5·39	78·3
II.	194	138·6370	5·10	6·80	156·6
III.	291	207·9555	5·83	7·80	234·9
IV.	388	277·2740	6·42	8·57	315·2
V.	485	346·5925	6·92	9·28	391·5
VIII.	776	554·5480	8·09	10·79	626·4
X.	970	693·1850	8·71	11·62	783·0
½	48½	34·66	3·18	4·25	39·2
¼	24¼	17·33	2·55	3·40	19·6
⅛	12⅛	86·65	2·00	2·68	9·8

If a "Seer" weight of 77¾ tolas = 2 lbs. avoirdupois were adopted, the "Seer measure" if the vessel be struck, would correspond sufficiently, for the weight of rice varies from 112 to 114 tolas to 100 cubic inches; and if the 9 grains standard be taken, the above "Seer-measure" will contain just 80 tolas, (at 116 tolas to 100 cubic inches) and be, when *struck*, the exact equivalent of what is now the average "Seer-measure" when *heaped.* This of course would render its introduction much easier than any other struck measure that can be adopted.

Even in the Madras Presidency, where the "Seer-measure" is not recognised in the Government Notification, such a measure averaging 80 tolas weight of rice when *heaped*, is in use in many of the districts, and the sepoys of the native army always buy by the seer, generally considering it to be ⅔ of the Madras "customary" measure of 104¼ cubic inches, which would give 69½ cubic inches, or an Imperial quart. On the 17th July 1855, the Madras Government, in consequence of some dispute on the subject, decided that the sepoy's Seer-measure" should be 5½ of the "Ollucks" named in their proclamation of 1836, or 68¾ cubic inches. This closely corresponds with the quart of 69⅓ cubic inches, which Mr. Bayley proposes as the standard "Seer-measure."

The only multiple of the "Seer-measure" that seems necessary for accounts, is one of 100 Seers, which might, as proposed above, be called a "Saotee." For sub-multiples Mr. Bayley proposes *eighths* (at'hee) as more in accordance with native usage. It is seldom that a less measure appears in commercial accounts than single seers, and therefore there is not so much object in a decimal sub-division.

The objection to the "Seer" proposed by the Bombay Government, which is a vessel holding a seer of 80 tolas weight of water, or a capacity of 57 cubic inches, is that it is a *misnomer*. If the native term "Seer" be used at all, it should be the native idea of a seer, that is, a vessel containing a seer weight of *grain*. This proposed seer only holds 70 tolas of mixed grain even when heaped.

The Metrical System which Mr. Bayley would propose for India, combining more decidedly than any other of which he can think the three great objects, viz., assimilation to the English system, approximation to the existing native system, and a means of testing both weight and measure of capacity by the coin of the country, is as follows: I. For Linear measure, the English yard and foot, without at present defining the subdivisions. II. For *Land* measure, the Acre, decimally subdivided. III. For *Weight*, the Seer, of 2 lbs. avoirdupois, corresponding to 77¾ Rupees weight; with a multiple of a "Mun" of 50 seers, (= 100 lbs.), and sub-multiples of "Annas" or 16ths of Seers. IV. For Measure of *Capa-*

a "Seer-measure" identical with the English quart, and defined as containing 97 tolas of water at a temperature of 84° (containing when struck, about a "Seer-weight" of mixed grain) with a multiple of a "Saotee" or 100 seers, and sub-multiples of "at'hee" or eighths.

Mr. Bayley succeeded in obtaining a decimal subdivision of the Acre in the new Revenue Survey of the Carnatic, and he also had occasion to recommend a decimal notation of the Assay reports of the Madras Mint.

It may be thought that as it is already a penal offence to use false weights and measures, the public are sufficiently secured; but there is little use in testing them so long as the standards are *not defined* by law, and the following are a few instances of the inconvenience arising from this laxity.

The first case was one where the land revenue having been fixed originally with reference to the produce and price of grain, complaints were made of its pressure, in consequence of a continued fall (as it was asserted) of price. To ascertain the truth of this was of much importance, and investigations were made by Government, in the course of which it was discovered that in one district, the official "Price Returns" had been 20 per cent. in error for some years, in consequence of the grain-dealers having altered the capacity of their measures. In the second case, a merchant at a seaport town sold a certain number of "candies" of copper to a captain of a vessel, who found on re-weighment for sale at Madras, that the weight was short. The seller was able to show that he sold by the candy where he resided, and if the dispute had not been settled by an amicable arrangement, no official authority could have decided the question, inasmuch as the candy is so many seers, and the seer so many rupees, but *what* rupee no one can tell: certainly not the present one, which is some grains heavier than the rupees of the native mints, current when the weights were originally established. In the third case, a long correspondence took place in the Military department, in consequence of a dispute as to whether a regiment of sepoys had not overdrawn their rations; it being asserted that the Seer-measure of the town where they were quartered, was too large. The Government requested the opinion of the Board of Revenue, but the only answer they could give, was that the native "seer" differed in different places, at the option of the bazaar-men, and that as the Government in their proclamation had made *no mention of a Seer* for use "in government transactions," there was no official definition of such a measure. In the fourth case, the Board of Revenue at Madras were informed that measures of capacity were in use in the town, bearing the Government stamp, and yet differing in capacity from the contents prescribed by the proclamation mentioned above. These measures were examined, and found to be 4 per cent. in error, but the Stamping Department asserted that they were in accordance with an *old standard* in their office, and the Government declined even to prohibit their seal being affixed to measures openly at variance with their own proclamation. All these instances occurred within three or four years, and similar cases happen constantly, for want of some positive law on the subject, and the evil cannot be remedied by a mere proclamation, which is not binding.

All government transactions, accounts, tariffs, &c., should be in terms of the new system, and in every purchase made by the public departments, their own standard weights and measures should be employed. This would supersede the attempts (always futile) to specify on every occasion, in equivalent terms of the authorized standard, the ever varying and uncertain values of the native weights and measures. For general purposes, and as a guide to the departmental officers, tables of equalization should be prepared for each district, showing the average results of experiments made to determine the value of the local weights and measures. Such tables though useful, will not of course be conclusive in every case of purchase, inasmuch as weights and measures differ in different villages, and the tables can only give the result of the average of the district. Such tables have been lately compiled in the presidency of Madras.

The following memorandum by Mr. Bate, being an enclosure in a letter from the Court of Directors of the E. I. Company to the Government of Madras, dated 6th July 1829, on the occasion of forwarding standard weights and measures in accordance with Act 5, Geo. IV. cap. 74.

TABLE I. Thermometer. **TABLE II. Barometer.**

Temp. Fahr.	Grains to add or deduct.	
55°	+ 25·30	At a temperature of 75° Fahr. a gallon of distilled water weighs 77·78 grains less than 70,000 grains. Or 70,000 grains—77·78 grains = 69922·22 grains.
56	+ 22·46	
57	+ 19·36	
58	+ 16·00	
59	+ 12·38	
60	+ 8·56	
61	+ 4·38	
62	— 0·00	
63	— 4·62	
64	— 9·49	
65	— 14·60	
66	— 19·94	
67	— 25·52

·5	·1·2300

Ex. Suppose the Barometer at 29·54 inches. (*below* 30°)

·5 = 1·2300
·04 = ·0984

1·3284 grains to be *deducted* from the Gallon of 70,000 grains.

If the Barometer is *above* 30 inches, the grains are to be added.

The following abstract, adapted to lbs. avoir. and to tola (or rupee) weights, has been prepared from the above :

Temp.	Grains of water in 100 cubic in.	Diff. in grains.	Avoir. lbs.	Tolas.
80°	25203·6	...	3·6005	140·020
81°	25200·6	3·0	3·6001	140·003
82°	25197·5	3·1	3·5996	139·986
83°	25194·3	3·2	3·5992	139·968
84°	25191·0	3·3	3·5988	139·950
85°	25187·7	3·3	3·5983	139·932
86°	24184·3	3·4	3·5978	139·918
87°	25180·8	3·5	3·5973	139·894
88°	25177·3	3·5	3·5968	139·874
89°	25173·7	3·6	3·5963	139·854
90°	25170·0	3·7	3·5957	139·834
91°	25166·2	3·8	3·5951	139·812
100°	25129·0	...	3·5899	139·600

Mr. Prinsep remarks that the system of weights established in India by Regulation VII of 1833, was founded on the same unit as the rupee of the equalized monetary system of British India. This unit of the British Indian Ponderary system is called the tola, which weighs 180 grains English troy weight, and from it, upwards, are derived the heavy weights, viz :—Chattack, Ser, and Man or Maund ; and its subdivisions, the smaller or jeweller's weights, called Masha, Rati, and Dhan. The following scheme comprehends both of these in one series :—

Man.	Panseri.	Ser.	Chhatak.	Tola.	Masha.	Rati.	Dhan.
1	8	40	640	3,200	38,400	3,07,200	12,28,800
	1	5	80	400	4,800	38,400	1,53,600
		1	16	80	960	7,680	30,720
			1	5	60	480	1,920
				1	12	96	384
					1	8	32
						1	4

The "Man" or Maund of 3,200 tolas, is that established by Regulation VII of 1833, and differs from the many weights of the same name throughout the country.

Panseri from panch, five, and ser, as its name denotes, is a five ser weight.

A Ser is the commonest weight in use in the retail business of the bazaars of India, and as it varies in quantity with the article sold, it has to be described as the Ser of so many tolas. The standard or bazaar Ser of Bengal being always 80 tolas. The Ser of salt is 82 tolas.

Chhatak, from Ch'he six, and tak marks, is the lowest denomination of the gross weights, and is commonly divided into halves and quarters (called in Bengali kachha), thus marking the line between the two series, which are otherwise connected by the relation of the Ser, &c., to the tola.

The Tola is chiefly used in the weighing of the precious metals and coins.

Masha, Rati and Dhan are weights used chiefly by native goldsmiths and jewellers. They are also employed in the native valuation by assay of the precious metals.

The following table will show how far the Indian system of weights corresponds with the Troy weights of England, and with the "Systeme Metricale of France." The coincidence of the former is perfect : and, in the latter, the masha nearly accords with the gramme and the ser with the kilogramme.

British Indian Weights.	English Troy Weights.				French Weights.
	lbs.	oz.	dwts	grs.	grammes
One Man... ...	100	0	0	0	37320·182
One Ser	2	6	0	0	933·005
One Chhatak ...	0	1	17	12	58·310
One Tola... ...	0	0	7	12	11·662
One Masha ...	0	0	0	15	0·972
One Rati... ...	0	0	0	1·875	0·122

The following scale will suffice for the conversion of English Troy weights into those of India.

℔. Troy.	Oz.	Dwt.	Grains.	Totals and Decimals.
1	12	240	5,760	32·000
	1	20	480	2·6666 etc.
		1	24	0·1333 etc.
			1	0·0055 etc.

The following are a few of the valuations for the principal weights of Europe, etc., extracted from Kelly's Cambist, p. 222 ; the weights in Troy grains have been converted into tolas by dividing them by 180.

Place and Denomination.		Weight of a single lb. mark &c. in tolas.	Number equal to 1 man or 100 lbs. troy.
Aleppo,	Metical ...	0·405	7890·410

Venice,	Mark ...	20·452	156·457
Vienna,	Mark ...	24·072	132·933

At Madras the *'man'* is assumed as equal to 25 lbs. avoirdupois, and at Bombay the more convenient equivalent of 28 lbs. or one quarter cwt. has been adopted for the standard man.

The ser at Madras contains 8 palams of 10 pagodas each, so that like the ser of Bengal it has the subdivision into 80 parts. In the Malabar system also used at Madras, 2½ palams (1 fanam) make a ser, and the tola occupies the place of the man ; it is equal to 23·192 lbs.

The ser at Bombay is divided into 30 pa'is or 72 tanks of 72 grains troy each.

Tank, as now existing in Bombay, is 72 grains. In Dharwar it is 50 grains, and in Ahmednuggur it is 268 grains.

Man. The man system follows the common scale, viz :

16 Chhatak = 1 ser.
40 ser = 1 man.
20 man = 1 khandi or mani.

Panseri. The use of a five ser weight also universally prevails under the name of Panseri, dhari or visa. The dhari, from its name however, seems to be properly a measure, and accordingly, while in Malwa it is equal to 5 sers, in other places it is found of 4, 4½, 5¾, 10, 11, and 12 sers.

The terms adhola or adheli, half ; pao or powah, quarter ; adhpao, half quarter, explain themselves.

Dry and Liquid Measures. India does not, properly speaking, possess dry or liquid measures. Where these are employed, they depend upon, and in fact represent the ser or man weight, and the value of a vessel of capacity rests solely on the weight contained in it. The mode in which this is effected for the dry measures of the south and west of India, is by taking an equal mixture of the principal grains, and forming a vessel to hold a given weight thereof, so as to obtain an average measure : sometimes salt is included amongst the ingredients. Trichinopoly is the only place where grain is said never to be sold by weight. The markal (properly Marakkal, from the Tamil) and para are the commonest measures : the latter is known throughout India. In Calcutta it is called ferrah, and is used in measuring lime, etc., which is still recorded however in the man weight. In its weights, Southern India retained, from the ancient Metrology of the Hindus, most of the names and terms properly hindu, پل pala ; تلا tula ; ويسا visa ; بهارا bhara ; كهاري khari ; كهاندي (? khandi), باها baha. Throughout the Moghul empire on the contrary, the ser and man were predominant. The word 'man' of Arabic or Hebrew origin is used throughout Persia and northern India, but it represents very different values in different places. Thus the man of Tabriz is only 6¼ lbs. avoir., while that of Palloda in Ahmednuggur is 163¼ lbs. The Man of India varies principally as follows :

Man of Bengal, containing 40 sers, and averaging 80 lbs. avoir.
„ Central India (Malwa, Ajmer &c. 20 sers & = 40 ...
„ „ Gujarat & Bombay 40 ... & = 28 ...
„ „ Southern India... ... = 25 ...

There are, however, many other varieties of man, from fifteen to 64 seers in weight.

By the British enactment of the 1st January 1826, one imperial measure was established as a substitute for the variable wine, oil and corn gallons of England, with their multiples and divisions. This imperial gallon was made to contain 10 lbs. avoirdupois weight of distilled water, weighed in air at the temperature of 62° Fahr. the barometer standing at 30 inches. It has a capacity therefore of 277·274 cubic inches, and the following are a few useful derivatives from this unit :

Imperial dry and liquid measures.	Cubic Contents.	Avoirdupois Weight.	Indian Weights.
1 pint...	34·659 c. i.	1 lb. 4 oz.	48·611 tolas.
2 ,, = 1 quart.	69·318 ,,	2 lbs. 8 oz.	97 222
8 ,, = 4 ,, = 1 gallon	277·274 ,,	10 lbs.	4·861 ser
64 ,, = 32 ,, = 8 ,, = 1 bushel. ...	1·284 c. f.	80 ,,	38·888 ,,
512 ,, = 256 ,, = 64 ,, = 8 = 1 quarter.	10·269 ,,	640 ,,	7·777 man.
2048 ,, = 1024 ,, = 256 ,, = 32 = 1 Chaldron	41·075 ,,	2560 ,,	31·111 ,,

The gallon nearly corresponds with the panseri or dhari of the Indian corn measures, while the bushel bears the same proximity to the man weight.

The following is the scale of measures in use at Madras.

				Cub. In.	
		1 Olluk	=	11·719	
8 Olluks	=	1 Padi	=	93·752	
8 Padis	=	1 Markal	=	0·750	= 27 lbs. 2 oz.
5 Markals	=	1 Parra	=	3·750	2 dr. water.
400 Paras	=	1 Garce	=	300·000	

Garce, TEL. Garissa, a Madras measure of 400 paras.

Olluk, HIND., a Madras measure of 11·719 cubic inches.

Padi, TAM., a Madras measure of 8 olluks.

Markal, TAM., a Madras measure of 8 padis.

Parra, TEL., a Madras measure of 5 markals.

Ceylon. The dry measure of Ceylon is thus given in the Oriental Metrology :

					gallons.		inch.
4	Cutchundoos	=	1 Ser	=	0·24	=	4·35 dram. + 4·35
4·8	Sers	=	1 Coornly	=	1·15		
2·5	Goornis	=	1 Markal	=	2·88		
2	Markals	=	1 Parra	=	5·76	=	cube of 11·56 ins.
8	Parras	=	1 Amonam	=	46·08	=	5¾ bushes.
8⅜	Amonams	=	1 Last	=	432	=	6¾ quarters.

Linear Measures.

Biswa from bis, HIND., twenty, is the twentieth part of a Beegha, and besides being a measure of land, is also used to signify the extent of proprietary right in an estate. Each estate or village is considered an integer of the Beegah which is divided into imaginary Biswa and Biswansee, to show the right of any particular party. Thus the holder of 5 Biswa is a holder to the extent of one-fourth of the entire village ; precisely in the same way as the *As* was used amongst the Romans. Thus *heres ex summuncia*, heir to one twenty-fourth ;—*heres ex dodrante*, heir to three-fourths ;—*heres ex asse*, sole proprietor. In the same manner, *bes*, *bessis*, was used to express a *biswa* : *berar*,—socius ex besse, and thus in sound and meaning, for of course there is no real connection, there is a close resemblance between the words. *Bes* when it was thus applied as a sub-division of the *As*, was the eighth part of a Jugerum or acre ; not, as is usually applied, two-thirds.

Coss, HIND., is the itinerary measure of India, of which the precise value has been much disputed, chiefly on account of the difficulties which attend the determination of the exact length of the gaz or yard. The Ayeen-i-Akberee lays down distinctly that the coss consists of 100 cords (tunab), each cord of 50 gaz ; also of 400 poles (ban), each of 12½ gaz : either of which will give to the coss the length of 5,000 gaz. The length of the coss, as ascertained from the average distances of the old coss minar or coss pillars, is = 2 miles, 4 furlongs, 158 yards. In different parts of India, however, these vary, and, in

India, the coss varies from about one mile to three miles.

The Guzeratee Coss is the greatest distance at which the ordinary lowing of a cow can be heard, which is determined to be 50 jureeb or 15,000 gaz. This coss resembles the Chinese *lih*, i. e., the distance which can be attained by a man's voice, exerted on a plain surface, and in calm weather. Another, in Bengal, is estimated by plucking a green leaf and walking with it till it dry. Another is measured by a hundred steps made by a woman carrying a jar of water on her head and a child in her arms. All these are very indefinite standards. The same may be remarked of the Oriental *meel*, as well as the European mile and league. The two former evidently derive their name from the Roman *milliare*, and the difference of the value proves that the mere name was borrowed without reference to its etymological signification. According to the *Kamoos*, the Oriental meel is a lax and vague measure, but it has been considered by Dr. Lee to be to the English one as 139 to 112. The league also, from the German *lugen*, to see, and signifying the distance that can be readily seen by the eye on a plain surface, is as indefinite as a Guzeratee gao and a Bengal or Dhuppea coss. Coss is an Indian word : the equivalent in Persian is kuroh, the same as the Sanscrit word krosa, of which four go to the *yojan*, about the precise value of which different opinions are held, four English miles according to Bopp ; 4½, 5 and 9 miles according to Professor Wilson ; but according to the distances in Fa Hian's route, the yojan in his time was equal to seven English miles, and this agrees much better with what we find the yojan to be when we resolve it into its component parts.

8 Barley corns = 1 finger
24 = 1 Dund
1000 = 1 Krosa
4 = 1 Yojan

and estimating the finger's breadth at eight barley-corns, this makes the yojan equal to six miles, one hundred and six yards, and two feet.

Hat'h. In the Linear Systems of India, the basis of all is the same, the cubit or human forearm ; and this unit is found in Oriental countries as well as in the West, divided into two spans and 24 fingers' breadths. Thus under the Hindu princes, the hat'h (in Sanscrit hasta) was equal to two *vitesti* or spans, and to 24 *angul* (angula). The *angul*, finger, is divided into 8 jau (Sanscrit yava) or barley-corns. 4 hat'h or cubits = 1 danda or staff : 2000 danda make 1 krosa or kos, which by this estimation should be 4000 yards English or 2¼ miles. The Lilavati states that 10 hat'h make one bans or bamboo, and 20 bans in length and breadth = 1 niranga of arable land. Natives of India in speaking of the *hat'h* or cubic, allude to the natural human measure of 18 inches, more or less, and it is practically used in measuring off cloths, ribbons, &c., and in taking the draft of water of a boat. In many places also, in Bengal and in Southern India, the English cubit has been adopted as of the same value as the native measure.

In Burmah, the people seemingly use a lineal measure of this name, consisting of the natural cubit plus a hand breadth, which would be about twenty inches.

Dhoncha, four and a half, is a word in use with the surveying ameens of India, when reducing their linear measurements to bigh'has ; the other words used by them in fractional multiplication are,

Deorha	1½	Poncha	5½
Dhuma	2½	Khoncha	6½
Honta	3½	Sutoncha	7½
Dhoncha	4½		

The size of the fields rarely require the ameens to go beyond this.

In Madras, Sir Thomas Munro established a measure (called a ground or mani) of 60× 40 or 2,400 square feet, of which 24 make a kani = 57,600 square feet, = 6,400 square yards, or exactly equal to four Bengal bighas.

The Madras kani is to the English acre as 1 to 1·3223, or as 121 to 160 nearly.

In Chingleput, the *adi* or Malabar foot is used which is 10·46 inches : 24 *adi* = 1 kali, and 100 square kali = 1 kani or nearly an English acre. The common kali however is 26 adis or 22⅔ feet, which makes the kani = 1 acre, 28¾ perches.

Guz, or yard. The Ilahee guz of Akbar is assumed by the British Government of India to have been 33 inches. The value of this measure varies in different parts of India. In most places the English yard of 36 inches is understood and will doubtless soon supersede all other values ; but the term *gaz* is one of mahomedan introduction.

The Akbari gaz for cloth measure = 46 fingers = 34½ English inches.

The Ilahi gaz, established by Akbar as the sole standard measure of the empire = 40 fingers = 30¾ English inches.

The Akbari beegha, of 3600 square gaz, = 2600 square yards = 0·538, or somewhat more than half an acre, on the above estimation.

The Ilahi gaz of Akbar was intended to supersede the multiplicity of measures in use in the 16th century ; and in a great degree it still maintains its position in the upper provinces of India. In general, however, different measures are employed in each trade, and the cloth merchant in particular has a distinct gaz of his own.

Jureeb, PERSIAN, is a measuring chain or rope. Before Akbar's time it was a rope, but he directed it should be made of bamboo with iron joints, as the rope was subject to the influence of the weather. European surveyors use a chain. A Jureeb contains 60 Guz, or 20 Gut'ha, and in the standard measurement of the upper provinces of India, is equal to 5 chains of 11 yards, each chain being equal to 4 Gut'ha. A square of one jureeb is a bhig'ha. Till the new system of survey was established, it was usual to measure lands paying revenue to Government with only 18 knots of the jureeb, which was effected by bringing two knots over the shoulder of the measurer to his waist. Rent-free land was measured with the entire Jureeb of 20 knots. A Jureeb in Hebrew and Arabic signified originally only a measure of capacity, equal to 4 Qufeez, or 384 Mud (Latin *modius*), and in course of time came to signify the portion of land which required as much to sow it as a Jureeb would contain. The Pat'ha and Nalee of Garhwal and Kumaon have a similar origin.

At the cession of the Carnatic, besides the Chittoor Pollams in N. Arcot, there were the two large zemindaries of Calastry and Cavetnaggur, the latter also known as Bom Rauze's country. Throughout the latter country (Bom Rauze's) the foot of the village god of Nanaveram was always taken as the unit of Land, Measurement of which 64 = 1 Goontah.

100 Goontah in Poongee. } = 1 Cawnee.
12 or 15 in Nungee. }

Rajpootana Grain Measure—

75 pounds = 1 seer.
43 seers = 1 maund.
12 maunds = 1 mauni.
100 maunia = 1 manassa.

Archipelago. The original measures of the Malays and Javanese were evidently by capacity (takàr) and not by weight, for which there are no words in their language except such as signify heaviness or balance. The lowest denomination for a measure of capacity among the Malaya goes under the name of chupak, most probably taken from the shell of the cocoanut or the joint of the bamboo. Of this, 4 make a gantang, and 800 of the last a koyan. These are native words the literal meanings of which are not known. The measures of length, as with other people, are taken from the members or parts of the human body, as finger-length, span, foot, pace, fathom, with the length from the foot of one side to the tip of the outstretched hand on the opposite one. Superficial or land measure is still more rude. Thus the Javanese, in reference to their irrigated land, the only description on which they set a special value, have, for the largest measure, what they term a jong, which, literally, signifies a ship, and this divided into halves called kikil, or a leg, and into fourths called ban, which means a shoulder. Another admeasurement of land goes under the name of the chacha, of which gawe-ning-wong is the synonym, the first word signifying "count" or "census," and the last "a man's work," that is, the quantity of irrigated land that a family of peasantry can till. This last term is of the same nature as the English "plough land." The business-like Chinese have introduced their own well-defined weights, although under native names. Thus we have the tail or weight of 23 drams avoirdupois, the kati consisting of 16 tail, and the piknul, which literally signifies a man's load or burden, composed of 100 kati or 133⅓ pounds avoirdupois. The weights and measures of the Malays, with their denominations, have not only extended over the whole Malay Archipelago, but are also prevalent in the Philippines. In the settlements of European nations the weights and measures of the natives have been fixed with precision. The Chinese have communicated their weights to all the adjacent countries : a pekul is equal to 133½ lbs. avoirdupois, and four lbs. being equal to 3 catties ; 100 catti make a pikul.

10 Cash = 1 candarin.
10 Candarin = 1 mace.
10 Mace = 1 tail.

16 Tail = 1 catti.
100 Catty = 1 pikul.

WELLESLEY, Marquis, a Governor General of India at the beginning of the 19th century.

WELLESLEY, Sir Arthur, afterwards Duke of Wellington. In his earlier commands, Colonel Wellesley fought at Seringapatam,
Ahmednuggur, surrender of, 11th Aug. 1803,
Assaye, battle of, 23rd Sept. 1803,
Berhampore surrendered 16th Oct. 1803.
Ahmednuggur city was taken by Sir Arthur Wellesley on the 11th August 1803, and immediately afterwards he received the surrender of the fortress, long regarded as the key of the Dekhan.

WELLESLEY PROVINCE, in the Malay peninsula, has remains of hindoo temples and mounds of shell-fish have been discovered.

WELLS. The real use of wells is to furnish supplies of water, but in the alluvial lands of India and in the beds of rivers, wells are frequently sunk by means of earthenware or iron rings, which are placed one over the other, and the inside earth or sand being scooped out, the rings sink down. These are called pot wells, and in Bangalore, cost about five rupees for a well eighteen feet deep; in Madras town, a pot well can be sunk at the rate of a rupee a foot. In the Rajputanah desert, water is only come to at depths up to 700 feet. But in the granitic tracts of India, the depth of wells ranges from 12 to 40 feet, according to the swell of the ground. The importance of wells in an arid tropical country cannot be exaggerated, and the fame which is acquired by sinkers of wells has an illustration in John iv. 6, where the well of Jacob sunk three thousand years before was still distinguished. Even yet, among the hindoo people, to sink a well, or form a water reservoir or tank, is deemed an act of merit. In the Panjab, pucka wells are usually worked by the "harth" or Persian wheel. A broad edged lantern wheel whose axis lies horizontally over the centre of the well's mouth, carries, on its broad edge, a long belt of moonj rope made like a rope ladder, the ends of which joined in an endless band reach below the surface of the water. To this, at every step of the rope ladder, an earthen pot called tind is fixed. As the wheel revolves, the large rope belt descends into the water with its pots, the pots become filled with water, and are drawn up: as they reach the top of the wheel, they are, by the revolution of the wheel, inverted, and their contents poured out into a trough, which is ready to receive them, and which leads to the water-course of the fields to be irrigated. Wells are often sunk in the alluvial soils of India as foundations for architectural structures.

In the Persian method of cooling wells, the well is covered in with beams, mats, and earth, and thatch is built over it to shield the water from the sun. The well, having been filled during the cold weather, may be opened in May, and the water remains as cool to the taste as ordinary ice water throughout the hot season. The water may be purified by being withdrawn into an earthen reservoir adjoining the well, and allowed to flow back. Ali Raza Khan, a Kuzzilbashee, was the first to introduce these wells into the Punjab. Two may be seen at Lahore; one near the Lohari gate, the other in the Sultan Serai. There are also two in the town of Umritsur and one at Peshawur. The people crowd to those wells during the hot season as to a fair. The ordinary mode of raising water in India is by the hand, but in the south of the peninsula of India, the pecottah is used. It is a lever balanced on a pole, from one end of which falls a bamboo with an iron pot, and a man walks from one end of the lever to another to raise and depress the respective ends.—*Powell, Hand Book, Ecom. Prod, Punjab. p.* 207.

WER. Hind. The hindi word "wer" designates a feud, and in it we have a striking coincidence in terms: wer is 'a feud', weree 'a foe.' The Saxon term for the composition of a feud, is wergeldt. In some of the Rajput states the initial vowel is hard, and pronounced "ber." In Rajasthan, ber is more common than wer, but throughout the south-west wer only is used. In these we have the origin of the Saxon word war, the Scotch weir, and the French guer or guerr. The Rajpoot wergeldt is land, or a daughter to wife. It seems to be the word found in many tongues, the Sanscrit vri, the Greek ἄρης, ἥρως, war, wehr, vir or virtus, indicating strength or protection, manly power.—*Tod's Rajasthan, vol.* i. *p.* 181.

WESTERN COAST of India includes the two Konkan, Canara, Travancore, Cochin, and Malabar, and comprises a strip of land of various width lying between the sea on the western side of India, and the range of Western Ghauts, which it includes. It is mostly undulating or hilly, almost everywhere covered with jungle of every description, from low bushes to the most lofty forest trees : most of the roads are lined with splendid avenues of banian, cashew, and various other fine trees. The climate is moist and comparatively cool.

WESTERN GHAT. Ghat is a term employed in India to designate a ferry or landing place on a river ; a range of hills, or the scarped wall of a table-land ; or the defile or pass leading through or down such. The Western ghat is the range of mountains which extend from the valley of the Taptee to the gap of Palghat, about 800 miles, and then, after an interruption, to Cape Comorin. The coast line from the sea to their base is generally flat and low with occasional spurs or solitary hills, but the ghats rise abruptly almost, scarped to an average height of 3000 feet, but Purunder is 4472, and Mahabaleshwara 4700, Matheran, a projecting spur, about 3[illegible]00. The Eastern Ghats extend from Orissa to Coimbatore along the eastern side of the peninsula of India, at distances of 50 to 150 miles from the Bay of Bengal. They are steep and well clothed with forests. The country lying between them and the sea is low, scarcely rising 100 feet above the sea. See Ghat, Ghatiya.

WHALEBONE. An elastic substance obtained from the upper jaws of the whale, which vary in size from three to twelve feet in length, and the breadth of the largest, at the thick end, is above a foot.—*Faulkner.*

WHALE BONE WHALE. Balæna mysticetus.

WHALES,

I',	Chin.	Ki-tian,	Chin.
King,	,,		

are mammals which live in the ocean. They are included in the order Cetacea, and family Balœnidæ. They are the largest of existing animals, and furnish whalebone, spermaceti and oil. They are classed as Whales, the genus Balæna ; Finners of the genera Megaptera and Physalis, Sperm whales of the genera Catodon and Beluga, species of the whale genera occur in the Arabian Sea, Bay of Bengal, Indian Ocean and Pacific Ocean, and occasionally float on shore. Whales of several varieties abound in those parts of the ocean lying between the Bonins and the coast of Asia, and are in great numbers in the neighbourhood of Japan. So large a creature could not escape observation, and the Greek sailors who accompanied Nearchus in his navigation of the Arabian Sea, were terrified by the appearance of whales (*Κετωα*, Arian. Hist. Ind. cap. 30). The whalebone whale is said never to venture beyond the limits of the Arctic seas. A whale was stranded on the Chittagong coast in August 1842, which measured ninety feet in length and forty-two in diameter, and another on the coast of Aracan in 1851, which was eighty-four feet long.

(A) Whales.

Physeter macrocephalus, *Linn.*
Physeter gibbus, *Schreber.*
,, trumpo, *Bonnaterre.*
Catodon trumpo, *Gerrard*
Cetus macrocephalus, *Oken.*
Northern Sperm whale.

Its principal food are the sepiadæ or cuttle fish, but it swallows small fishes.

(*l.*) *Catodon Colneti.* The Mexican sperm-whale is an inhabitant of the North Pacific, the South Seas, and the equatorial oceans.

(*m.*) *Catodon polycyphus.*

South Sea Sperm whale.
Cachalot.
Sperm whale.

Inhabits the southern ocean.

(*n.*) *Catodon Kogia, Gray.* Taken near the Cape of Good Hope. It has a short head, and is supposed to be the young of C. polycyphus.

(*o.*) *Catodon Australis,* a sperm whale of the ocean near Australia. It is about 35 ft. long.

(*p.*) *Beluga Kingii,* has been taken off the coasts of Australia, where it represents the white whale, B.·catodon, Catodon macrocephalus.

The following kinds of whales occur at Japan.

Kud suri, JAP., is caught frequently about Japan, but particularly in the Sea Khumano which washes the southern coasts of the great Island Nipon, as also about the islands Tsussima and Goto, and upon the coasts of Omura and Nomo.

Sebio, JAP., is the chief, and indeed the largest of the whale kind. It affords most train oil, and its flesh is very good and wholesome, so far that fishermen and the common people attribute their good state of health amidst all the injuries of cold and weather to which they are continually exposed, chiefly to their eating this flesh.

Awo Sangi, commonly Kokad-sura, that is, small whale, is gray or ash-colored, smaller than the Sebio, from which it also differs something in shape.

Nagass, JAP., is commonly 20 to 30 fathoms long, and has this particular, that it can stay under water for two or three hours, during which time it can travel a vast way, whereas other whales must continually come up to the surface of the water for fresh supplies of air.

Sotookad-sura, JAP., that is, the whale of blind people, so called from the figure of a Bijwu, a sort of lute, which blind people in Japan use to play upon, which is said to be naturally represented on its back. It is not a very large sort, and seldom exceeds ten fathoms in length. It is caught frequently about Japan, but the flesh is reckoned unwholesome food, being as they say too hot, and occasioning coughs, fevers, eruptions on the skin, and sometimes small-pox. It is brought to market with other fish, and sold for the flesh of the sebio, but those who know it will never buy it.

Mako, JAP., never exceeds three or four fathoms in length. This same name is given to the young ones of the other kinds. This is caught frequently upon the eastern coasts of Japan, as also upon the coasts of Kij nokuni and Satzuma. Ambergris is found in the intestines of this whale. The head yields a small quantity of train-oil.

Iwasikura, JAP., that is, Sardin's Eater, has a tail and fins like common fish. Kæmpfer saw this sort when he went up to court, between Caminoseki and Simmoseki, and took it to be that which the Dutch call Noord Caper.

Of all these several kinds of Japanese whales, nothing is thrown away as useless, excepting only the large shoulder bone. The skin, which is black in most kinds, the flesh, which is red and looks like beef, the intestines, which from their remarkable length are called Feakfirs, that is, an hundred fathoms long, and all the inward parts, are eaten pickled, boiled, roasted, or fried. The fat or blubber is boiled into train-oil, and even the sediments of the second boiling are eaten. The bones, such as are of a cartilaginous substance, are boiled when fresh, and cut, or scraped, cleaned and dried for the use of the kitchen. Several little things are made of the jaw-bones, fins and other bones, which are of a more solid substance, and particularly their fine steel-yards for weighing gold and silver are made of them, and have borrowed their name from them.

The Cachalot, Physeter macrocephalus, is the sperm whale; the male ranges in length from 38 to 76 feet, and is about 60 feet in the average, but the female does not exceed 30 or 35 feet. The cachalot is without symmetry, of a prevailing dull black colour, occasionally marked with white, especially on the abdomen and tail. They propel themselves round by striking and pulling against the water with the flashes of their tails. The lower jaw is diminutive, slender, and in form not unlike the mandible of a bird; the teeth of the upper jaw, wholly ivory, in aged males are of great solidity, and weigh from two to four lbs. each. It spouts a thick watery mist from its nostrils at intervals of ten or fifteen minutes. Its valuable fat or sperm is chiefly situated in the head. It is a solid mass of soft yellow oily fat, weighing between two or three tons, in a hollow of the head, bared on the upper jaw, and forming the front and lower part of the snout. The cavity, called *case*, is situated to the right and beneath the spouting canal, and corresponds to nearly the entire length of that tube. It is filled with a very delicate well of cellular tissue, containing in large cells a limpid and oily fluid, which is liberated on the slightest force. The quantity, chiefly spermaceti, contained in this singular receptacle, is often very considerable, and nearly 500 gallons have been obtained from the case of one whale. It has been noticed in the Mediterranean, and a stray individual in the Thames. Cetaceum, LATIN, the Spermaceti, is a concrete, fatty substance, found in several parts of the body of the great-headed cachalot whale, the Catadon macrocephalus, but the head is the chief repository of this secretion, especially a cavity in the upper jaw, in which it exists mixed with oil. The spermaceti whale occurs in the Pacific, Indian, and Chinese seas. The liquid first drawn from the head of the animal is a mixture of spermaceti and sperm oil; from this the solid matter is separated by filtration through bags, and subsequent compression. After this it is melted in water, skimmed, and re-melted with a little potash water, to remove the last traces of the oil; lastly, it is permitted to concrete slowly, during which it is crystalized in brilliant white masses. Pure spermaceti is white, tasteless, inodorous, crystaline, insoluble in water, slightly soluble in boiling alcohol; it forms a soap with potash. It is composed of carbon 81·66, hydrogen 12·86, oxygen 5·47. Spermaceti was once much used internally as a demulcent and emollient, especially in troublesome catarrhs and dysentery. It is at present employed solely as an external application, being an ingredient in numerous cerates and ointments. Mr. Beale gives eighty-four feet as the length of a sperm whale of the largest size, and its diameter twelve or fourteen feet. Of this huge mass, the head occupies about one-third of the entire length, with a thickness little inferior to that of the body, while, as this thickness is equal throughout, the front of the head terminating abruptly, as if an immense solid block had been sawn off, this part of the animal bears no small resemblance to an immense box. The appearance of a whale when disturbed, and going what seamen call "head-out," with his vast bluff head projected every few seconds out of water, has a most extraordinary appearance.

Beluga Catodon, of *Pallas*, also placed by Gray, Gerard, Lesson and Lacepede as of the genera Physeter, Delphinus, Delphinapturus, and Catodon, is one of the Delphinidæ, found in the North Pacific, North Atlantic and Arctic Oceans.

Globiocephalus Indicus, *Blyth*, the Ca'ing whale, is closely affined to the European Gl. deductor, but differs externally in being wholly of a black colour. Its inter-maxillaries are shorter; the teeth fewer and larger, numbering 6 or 7 above, 7 or 8 below, on each side: the upper view of the maxillaries differs considerably in contour, being broader and less elongated in the Indian species; and there are other discrepancies which are less marked.

Globiocephalus Rissii. The Yellow Sea affords this species of Cowfish or round headed cachalot, which the Japanese capture. Other species of whale resort to the waters east of Manchuria.

Seals have been observed on the coasts of Liantung, but nothing is known of their species or habits.—*William's Middle Kingdom, p.* 258. *Tennent Sket. Nat. History of Ceylon. p.* 68. *American Expedition to Japan, p.* 243. *Captain Sparkes in Beng. As. Soc. Journ. No.* 4. 1852, *p.* 68. *Ouseley's Travels, vol.* i. *p.* 150, 230, 231. *Arrian Hist. The geographical range of the wheat region in the eastern continent and Australia, lies principally between the 30th and 60th parallels of north latitude, and the 30th and 40th degrees south, being chiefly confined to France, Spain, Portugal, Italy, Sicily, Greece, Turkey, Russia, Denmark, Norway, Sweden, Poland, Prussia, Netherlands, Belgium, Great Britain, Ireland, Northern and Southern Africa, Tartary, India, China, Australia, Van Diemen's Land, and Japan. Along the Atlantic portions of the western continent, it embraces the tract lying between the 30th and 50th parallels, and in the country westward of the Rocky Mountains, one or two more degrees further north. Along the west coast of South America, as well as in situations within the torrid zone, sufficiently elevated above the level of the sea, and properly irrigated by natural or artificial means, abundant crops are often produced. Wheat has, from time immemorial, been a staple crop in the plains of Northern India, and especially in the Punjab. The climate and soil are well fitted for this cereal, but owing to defects and carelessness in the agriculture and harvesting, the crops, though excellent, fall short of what most corn-growing countries produce. Further—owing to foul boats and granaries, and to the moist heat of the months immediately succeeding harvest, the Indian wheat reaches England in a state too dirty and weevelled for market. The hard wheat is preferred by the natives of India to the soft. Wheat is grown to a great extent in Berar, in Coimbatore, and largely in Burmah; but Mr. Mason had never seen it under culture in the Tenasserim Provinces, although Commissioner Durand made an attempt to introduce it. No doubt, on the Karen mountains, the cultivator would reap an ample harvest. In India there are several species and varieties of wheat, viz:

Tr. vulgare, var. hybernum, or winter wheat.
„ „ „ æstivum, or spring wheat.
„ compositum, Egyptian wheat.
„ spelta, Bere or spelt, much cultivated in France.
„ monococcum, remarkable for its single row of grain.

That which is chiefly cultivated in England is the Triticum vulgare; of this there are two varieties—T. æstivum, or summer wheat, and T. hybernum, or winter wheat: the former is sown in the spring, and the latter in the autumn: of these varieties, again, there are several different modifications. On account of the early cultivation of many of the kinds of wheat as articles of diet, it is impossible to tell where the most common species are really indigenous. All the species of Triticum are, however, found most abundantly in temperate climates, and there take the place of the food used in the hotter parts of the world. Wheat is in northern climates what rice and maize are in warmer ones. In India, wheat of all kinds is the growth of the rabi or spring harvest. The number of varieties in the Panjab is not in reality very great, though considerable difference of nomenclature exists. Wheat is sown in the months of Kartak and first half of Maghar, for the rabi harvest, and is cut in Baisakh (April.) Wheat is often sown mixed with barley; this is called goji in the Punjab, and trikala in Cis-Sutlej States, or with gram, Cicer arietinum, and then called bhera; or the red and white varieties are sown together under the name of jogyan. The principal difference observable in Panjab wheats, is that some are bearded and some are awnless; there are two sorts of the bearded wheat, one with a dark colored beard, the other with a light yellow beard.

Dr. Royle had not seen wheat higher than 8,000 feet, but Gerard speaks of wheat at 10,000, and Captain Webb of wheat at 12,000, on the southern slope of the Himalaya. The extreme limit is given at 13,000 to 15,000 feet. Wheat grows to a height of 13,000 feet at Lara and Ladang, above Dangk-kar in the Spiti valley. In the valley of the Indus, it appears at Ugshe and Chimra, at 11,000 to 12,000 feet. A wheat, called Daud khani, with a large and very white grain, was introduced from the N. W. Provinces, and grown chiefly on the banks of the Sutlej, on alluvial and irrigated lands. It is much used by sweetmeat makers on account of its being so white. It sells, where grown, at about 31 to 32 seers per rupee, always cheaper than pamman, being considered inferior.

Mooltan wheat is beardless, and its grain long and heavy. It is exported in large quantities to Rajpootana and to Sindh.

Wheat is largely used in China. It is exclusively raised in the provinces of Honan, Shensi, Shansi, Shantung and Pehchihli. As a rule it is sown in winter, although occasionally as a spring crop. It is usually sown broadcast.

The part of the wheat plant which yields the food of man is the fruit, seeds, or grain. This fruit, although small in itself, generally forms a large proportion of the plant. Wheat-seeds or grains, as brought to the market, and as supplied to the miller, are deprived of their paleæ, or husks, which, when coarsely ground, form the article known as bran and pollard. The number of parts into which ground wheat is separated, and the amount of each yielded by given quantities, vary according to the characters of the wheat, and the processes adopted by different millers. In the wheats which are hard, the integuments separate with difficulty, and therefore the flour produced from these usually contains a greater proportion of adherent bran than do those flours procured from wheats which are soft, and which part with their epidermic coverings more readily. The following are the products with the quantities obtained, of one quarter, or eight bushels of ground English wheat weighing 504 lbs.

Flour	392 lbs.
Biscuit, or fine middlings	80 ,,
Toppings or specks	8 ,,
Best or Turkey Pollard, or twenty penny	15 ,,
Fine Pollard	18 ,,
Bran and coarse Pollard	50 ,,
Loss sustained by evaporation, and waste in grinding, dressing, &c. ...	11 ,,

All kinds of wheat contain water in greater or lesser quantities. Its amount is greater in cold countries than in warm. In Alsace from 16 to 20 per cent.; England from 14 to 17 per cent.; United States from 12 to 14 per cent.; Africa and Sicily from 9 to 11 per cent. This accounts for the fact that the same weight of southern flour yields more bread than northern, English wheat yields 13 lbs. more to the quarter than Scotch. Alabama flour, it is said, yields 20 per cent. more than that of Cincinnati. And in general, American flour absorbs 8 or 10 per cent. more of its own weight of water in being made into bread than the English. The English grain is fuller and rounder than the American, being puffed up with moisture. To ascertain the amount of water in flour, take a small sample, say five ounces, and weigh it carefully; put it into a dry vessel, which should be heated by boiling water; after six or seven hours, weigh it; its loss of weight shows the original amount of water.

Bombay wheat is whiter and heavier than that from Kattywar, and produces a greater quantity of soojie and flour. That of Kattywar is smaller and darker, and produces good flour though smaller in quantity, with less soojie.

Bread. In India, in making bread of wheat, one process is first thoroughly to clean the wheat, and for this one woman will clean 430 lbs. in a day, and in the evening the cleaned wheat is placed on a table and thoroughly wetted and the water left to drain from it during the night. The next morning, the still moist grain is ground in handmills by women, a woman grinding lbs. 40 in a day. It is then sifted, and as much fine flour and soojie as can be obtained are laid aside. The remainder, then termed " Naka," is subjected to a more powerfull mill, and an inferior kind of soojie and a second sort of flour obtained from it. The residue is then ground in a large mill, and yields a coarse flour and bran.

Bran is what remains of wheat after the flour and soojie is extracted.

Soojie is the heart of the wheat and is obtained by coarsely sifting the coarsely ground wheat with sieves and sooras, by which all the small particles of the bran are separated from it; one woman can thus clean lbs. 50 a day.

First sort flour is produced by finer sifting from the first grinding of the wheat.

Second sort flour is sifted from the first grinding of the wheat, after the fine is extracted, and also from the second grinding.

Bread. The materials for bread are lbs. 60 of 1st soojie, lbs. 20 of 2nd sort or naka soojie, and lbs. 20 of 1st sort flour. lbs. 100 of these ingredients produce lbs. 128 of bread.

Biscuit is made from 2nd sort soojie and flour mixed in the proportion of lbs. 75 of naka soojie and lbs. 85 of second sort flour. This produces only about lbs. 85 of biscuit, which after being well baked, is dried for two days in a kiln.

Barm or yeast sufficient for 800 loaves, lb. 1 each, is made of brown sugar lbs. 2, potatoes 1½ lbs, hops oz. ½, with half a gallon of water; boil and mash the potatoes; boil the hops until none appear on the surface of the water, strain and dissolve the sugar in the liquor. The potatoes are then added, and the whole is strained into a jar or small tub. The quantity produces about 3½ pints, and is generally ready for use in 12 hours. The addition of a small portion of the old Barm hastens fermentation. —*Royle* ; *Bombay Times* ; *Simmonds* ; *Stewart* ; *Smith* ; *Powell* ; *McCulloch.*

WHEAT-EAR. The Indian wheat-ear, Saxicola atrogularis, is generally distributed over sandy wastes. The black-throated wheat-ear, Saxicola atrogularis, is common ; its favourite food is a small white worm, which it digs out of the sun-baked soil.—*Adams.*

WHEAT-MIDGE. Cecidomyia tritici, a fly and its caterpillar, infecting wheat.

WHEELER, J. TALBOYS, author of Madras in the Olden Time. The History of India from the Earliest Ages. The Geography of Herodotus, etc. etc. Vol. I. The Vedic Period and the Maha Bharata. 8vo. cloth, p. lxxv. and 576. 18*s*.—Vol. II. The Ramayana and the Brahmanic Period. 8vo. cloth p. lxxxviii. and 680, with 2 maps. 21*s*.

WHEELS. To keep tires on wheels, before putting on the tires fill the felloes with linseed oil ; use a long cast-iron oil heater, made for the purpose ; the oil is brought to a boiling heat, and the wheel is placed on a pole so as to hang each felloe in the oil for one hour. The timber should be dry, as wet timber will not take oil. Care should be taken that the oil be not made hotter than boiling heat, in order that the timber be not burnt. Timber filled with oil is not susceptible of water and much more durable.—*Fam. Herald.*

WHIRL POOLS.

Yay-way,	BURM.	Gird-ab,	PERS.

These occasionally occur in the Ganges and Irrawadi. A native writing of one which he saw near Koostee, says he saw the water within two or three miles whirling into a cavity several yards deep, which, after an interval, disgorged that which it had previously taken into it.

WHIRLWIND.

Lay-boay,	BURM.	Gird bad,	PERS.
Devil-wind,	ENG.	Peshash,	TAM.

The whirlwinds which occur in the desert west of Kharan, near Regan in Baluchistan, would perhaps be more correctly called by some other name. They are vast columns of sand, which begin by a trifling agitation with a revolving motion on the surface of the desert, and gradually ascend and expand, until the tops of them are lost to the view, in which manner they move about with every breath of wind like a pillar of sand. Lieut. Pottinger saw at the same time thirty or forty of them of different dimensions, apparently from one to twenty yards in diameter. Those who have seen a waterspout at sea may exactly conceive the same formed of sand on shore. Whirlwinds are extremely common in the Panjab, and in the central parts of the peninsula of India, and some of them are supposed to be owing to electric action. Dr. Adams, writing of them, observes that about noon, when the west wind sets in, clouds of sand sweep across the country, penetrating through the minutest chinks and crevices. Whirlwinds (or devils, as they are commonly called by Europeans) are then of frequent occurrence. At a distance they look like revolving clouds of smoke, shooting upwards fully 200 feet. These cycloidal movements often last for upwards of half an hour, and carry with them whatever light substance they may encounter ; after gliding along for some distance they finally disappear. The meeting of two opposite currents of air is no doubt the cause, inasmuch as a whirlwind was always seen to commence at the corners of two ranges of buildings placed at right angles to each other. The following note of the loss of polarity by the needle during a whirlwind is given in a letter in the Bombay Times, May 30, 1846 :—

"There is a class of magnetic local perturbations apparently confined to these seas, one of which was experienced by the Queen on her late voyage from Aden, which we do not remember to have seen noticed by magneticians. When about three hundred miles from Bombay, the people on board the steamer observed the atmosphere get suddenly clouded all around with that strange lurid appearance which indicates the approach of a burst of rain or hurricane. By and bye appeared over head those strange and turbulent vapours commonly attendant on a whirlwind or waterspout,—and a light whirlwind accordingly made its appearance. At this time the magnetic virtue of the compass appeared to vanish : the needle lost its polarity and traversed equally in all directions. A state of matters so surprising was of short endurance : the sky cleared without a tempest, and all went well again. It was, we think, about A. D. 1844, that an accident of this sort was met with by the H. C. schooner Mahi on her way from the Persian Gulf. She was surrounded by beautiful groups of whirlwinds and waterspouts ranging about her in all directions, when suddenly the needle lost its polarity and continued for some time useless for the purpose of steering. We are unable to lay our hands on the account of the circumstance published at the time, but remember perfectly its occurrence. To these we may add many others. Dr. Bradley has clearly established the fact that the lesser whirlwinds at all events are either due to direct electrical agency, or are characterised by the most striking electrical exhibitions.—*Pottinger's Travels, Beloochistan & Sinde, p.* 135-6. *Adam's Naturalist in India.*

WHITE AIN. Eng. Pentaptera arjuna.

WHITE ANTS, or Termites, literally build a cell round the great progenitrix of the community, and feed her through apertures. Whenever buildings are infested with the destructive white-ants, their nests containing the queen ant will always be found in the immediate neighbourhood ; and as the destruction of the queen ant destroys the colony, there is no reason why any building should suffer from this destructive insect ; and instructions are now given generally for digging up the white-ants' nests in the neighbourhood of all public buildings. Writers often take it for granted that the nest of the white-ant contains only one queen, but a royal cell not unfrequently contains two, and sometimes three queens, and several royal cells containing one or more queens, may frequently be found in the same nest. The ground should be excavated until the entire destruction of the nest has placed the destruction of all the queens beyond doubt. Vegetable wax has been found efficient in checking the approach of the white-ants. Cultivators of sugar-cane know how destructive are the ravages of these insects, and the following is said to be an efficacious, though rather tedious remedy :

Asafœtida (*hing*), 8 chittack ; mustard seed cake (*Surson ki-khulli*), 8 seer ; putrid fish, 4 seer ; bruised butch root, 2 seer ; muddur, 2 seer. Mix together in a large vessel with water sufficient to make them into the thickness of curd ; then steep each slip of cane in it for half an hour before planting, and, lastly, water the lines three times previous to setting the cane, by irrigating the water course with water mixed up with bruised butch root, or muddur, if the former be not procurable. White-ants can be completely extirpated from a cane plantation, by manuring the soil well with mustard cake, and stirring it up constantly. A mixture of quick-lime, soap and tar, smeared where the white-ants appear, puts an effectual stop to their inroads. Tar, turpentine, kerosine oil, earth oil, and margosa oil are also valuable ; wood ashes also are of value, sprinkled about the orifices of the dwellings, and smoking them out with wet straw ; the Acorus calamus, steeped in water, is said to be of use. Sarcostemma acidum is employed in the west of India to destroy them. The " Poona Observer" states that tobacco decoction was applied to a piece of ground where for eleven years the white ants had destroyed every thing put down ; their removal was most effectually secured by the sprinkling of the decoction. The timbers which have proved least susceptible of injury by white-ants are Teak, Peddawak, Trincomallee, and Rose. Solutions of salts, ashes, and quick-lime, prove temporarily efficacious ; and if dry ashes be put into an ant hill, and hot water poured in, the ants will be killed.

Saturating the soil beneath the floors and about the foundations with salt water brine, &c., especially with the brine from fish boilings, which take place where fish oil is made, may prove effectual.

In existing buildings, augur holes from the top of the beams near the walls may be bored, and fish oil or the earth oil (naphtha) poured in, and allowed to find its way into the wood. In short a process similar to creosoting extemporised. Fish oil is effectual, and is more readily diffused through the wood.

A coating of tar, creosoting, and impregnation with dilute sulphate of copper, by means of Boucherie's apparatus, appear effectually to preserve timber and other substances from the attacks of white-ants.

Few timbers (unless they have gone through some creosoting of kyanising operation) can be said to be quite impervious to the attack of white-ants. The timber of the Strychnos nux vomica is, however, quite proof against them, probably owing to the very bitter properties of the timber. The Sal or Shorea robusta, also, as far as has been observed, quite withstands their attacks. The harder timbers of India, such as the iron wood or Mesua, the Soymida febrifuga, and the Acha, or Hardwickia binata, are the timbers least susceptible of injury by this insect.—*Mr. Simpkins, Mr. Rohde, Mr. Smart, Col. Simpson, Dr. Hunter, Captain R. H. Beddome, Captain Dangerfield, Col. T. H. Campbell in Proceedings Madras Military Board. Poona Observer.*

WHITE ARSENIC. White oxide of arsenic.

WHITE BALSAM of commerce, also called Myrrh-seed, also quinquino, is made from the balsam of Peru, which is a product of the Myrospermum peruiferum of Central America, also from the M. pubescens.

WHITE BASIL. Basella alba, *Linn.*

WHITE BREAD FRUIT. Artocarpus pubescens, *Willde.*

WHITE CEDAR. See Cedar.

WHITE CLOVER, or Dutch Clover. See Clover seed.

WHITE COCK'S-COMB. Sirwari. Hind. Celosia argentea.

WHITE COPPER. See Copper.

WHITE COPPERAS.

White vitriol,	Eng.	Sal vitrioli,	Lat.
Sulphate of zinc,	,,	Zinci-sulphas,	,,
Sulfate de zinc,	Fr.	Caburnic,	Sans.
Schwefelsaures,	Ger.	Vulley-tootum,	Tam.
Zinkoxyd,	,,	Tootum,	Tel.
Suffed Tootia,	Guz. Hin.		

A salt formed by the union of sulphuric acid with the oxide of zinc. It is found native in the mines of Goslar and other places.—*Faulkner. McCulloch.*

WHITE COTTON TREE. Eriodendron anfractuosum, *D. C.*

WHITE CUMIN. Eng. Cumin seed.

WHITE DAMMER. Resin of Vateria Indica, *Linn.* See Resins.

WHITE DENDROBIUM. Dendrobium cretaceum.

WHITE DOG ISLANDS. See Min river.

WHITE EUGENIA. Conocarpus latifolia.

WHITE FLOWERED BARRINGTONIA. Grows in the Tavoy and Mergui jungles, with drooping spikes of white flowers three or four feet long; and which would be much admired if introduced into the cities. The leaves are very large and lyre shaped, and both flowers and foliage would contrast well with the other trees around it. The species is not described.—*Mason.*

WHITE-FLOWERED RHODODENDRON. Rhododendron argenteum.

WHITE FLOWERING JUSTICIA. Justicia nasuta.

WHITE GALLS. See Galls.

WHITE GOURD. Eng. Benincasa cerifera, *Savi.*, also Cucurbita hispida, *Willde, Ainslie.*

WHITE GUAVA. Psidium pyriferum, *Linn.* Guava tree.

WHITE GUM, of Van Diéman's Land. See Eucalyptus.

WHITE HUNS. Khondemeer quotes the Nizam-ut-Tuarikh as to the king of the Hiatila or White Huns.—*Malcolm's History of Persia, vol. i. p. 177.*

WHITE JUARI. Anglo-Hind. Sorghum vulgare.

WHITE LEAD.

Asfeidaj,	Ar.	Bleiweiss,	Ger.

Kwanfen; Shwui-fen;	,,	Sibaydu,	Tel.
Carbonate of lead	Eng.	Istibedsh,	Turk.
Plom Carbonate,	Fr.		

This carbonate of lead is made by heating thin plates or thin tubes of lead in vinegar; when mixed with oil, it becomes white paint.

WHITE MALABAR NIGHTSHADE. Basella alba, *Linn.*

WHITE MANGROVE. Avicennia tomentosa, *Linn.*; *Roxb.*; *W. Ic.*

WHITE MISSI.——? See Heera-kassis.

WHITE MOUNTAIN EBONY. Bauhinia candida.

WHITE MUSLI. See Moosli.

WHITE MUSTARD. See Mustard seed.

WHITE OXIDE OF ARSENIC. See Arsenic.

WHITE PADDY-BIRDS. See Egret.

WHITE PADOUK. See Kino.

WHITE PEPPER.

Suffed Mirch,	Guz. Hind.	Vella mellogu,	Tam.
Piper-album,	Lat.	Tella mirrialu,	Tel.

The fruit of a slender climbing plant, Piper nigrum, gathered after it is fully ripe, and freed of its dark coat by maceration in water. It is smooth on the surface, and is milder than the black-pepper. The plant is extensively cultivated in Malabar, Sumatra, Siam, Malacca, &c.—*Faulkner.*

WHITE PUMPKIN. Lagenaria vulgaris, Cucurbita lagenaria, *Linn.*

WHITE ROCK. See Pedra Branca.

WHITE ROCK-SALT. See Iran.

WHITE ROSE-SCENTED BAUHINIA. syn. of Bauhinia albida? *Gibson.*

WHITE SAPPHIRE. See Corundum.

WHITE SQUALL. See Cyclone, Hurricane, Storm, Wind.

WHITE THORN. Cratægus crenulata, *Roxb.*

WHITE TOURMALINE. See Tourmaline.

WHITE VITRIOL. Sulphate of zinc. White copperas.

WHITE WOOD, or White Cedar of Jamaica. Bignonia leucoxylon.

WHITING. See Chalk.

WHITING FISH.

Indian whiting,	Eng.	Darya ka Shaikara,	Duk.
Kullengan mutchie	Duk.	Kellunga meen,	Tam.

Two or three species of fish common in Calcutta are called whiting, from their resemblance, both in form and flavour, to the European fish of that name.

Corvinus coitor, *Blyth,* inhabits the estuaries of the Ganges and Irawaddy. Its air-bladder makes excellent isinglass. Mr. Mason describes the Corvinus coitor, or Indian whiting, and the Polynemus sele as yielding isinglass in Tenasserim. Corvinus coitor is frequently seen in the Maulmain bazars, and besides being a good fish for the table, its air-bladder makes excellent isinglass. More species than one are sold under the same native name. Corvinus chaptis, Balo chaptis, the Bola, inhabits the Malay coast: furnishes isinglass.

WHITLOW ROOT. Eulophia virens, *R. Br.*

WHONAY. Can. Pterocarpus marsupium.

WHORL FLOWERED RUELLIA. Ruellia strepens.

WI. See Karen.

WI. HIND. of Sutlej valley, Olea Europea, O. ferruginea, O. cuspidata. Olive.

WIANDUHREN. GER. Clock.

WICKER and leather boats traverse most of the rivers in the peninsula of India.

WIDDA-TILAM. TAM. Oil of Mentha crispa, M. sativa. Mint. Peppermint.

Vedova,	IT.	Vi-dhava,	TEL.
Vidua,	LAT. SP.		

The widows of the various races of south-eastern Asia, are treated very variously. Amongst the polyandrist Nair race, such a state as widowhood is an impossibility. With several races, when a brother dies and leaves a widow, another brother marries her.

The mahomedan law also permits re-marriage of widows, and in Arabia, Persia and Egypt such is common ; but in British India, mahomedan widows rarely re-marry. Amongst the Jews of old the widow was allowed to re-marry, and amongst the hindoos re-marriage of widows is permitted by their great law-giver Menu, but in practice it is almost never practised. The painfulness of the widowed state is alluded to in Lamentations i. 1, "How is she become as a widow," and this can be understood by no one so well as by a hindoo widow, who is considered as the most forlorn and desolate being on earth ; such a female has her hair cut short, she renounces all ornaments, eats the coarsest food, fasts frequently, and is all but an outcast in the family of her deceased husband. In British India, until the administration of Lord William Bentinck, many of the widows of rajputs and brahmins burned themselves on the funeral pyres of their husbands ; and to this day, in the island of Bali, the widows are stabbed with a kris, and their bodies burned with that of their husband's. Widow burning is not authorised in the Rig-Veda : a widow is merely to accompany her husband to the funeral pile, and there is addressed with a vedic verse, viz., Rise woman, come to the world of life, thou sleepest nigh unto him whose life his gone : come to us. Thou hast thus fulfilled thy duties of a wife to the husband who once took thy hand and made thee a mother.—*Max Muller, Chips, p.* 35. See Woman.

WIEGANE——? Eaten in various forms. The oil expressed from it is considered to possess certain medicinal virtues.

WIEPA-WANSE, a Ceylon tribe of cultivators and shepherds.

WIGHT, Dr. Robert, of the Madras Medical Service, a distinguished botanist and long in charge of the cotton experiments at Coimbatoor. Author of Contributions to Indian Botany, Lond. 1 vol. 8vo.—Icones Plantarum Indiæ Orientalis, 1 vol. 4to.—Wight and Arnott's Prodromus Floræ Peninsulæ Indiæ Orientalis, 1 vol. 8vo.—On the medical properties of Mudar, Mad. Lit. Trans. 1835, vol. ii, 70.—On the Nuth Grass of the Ceded Districts, Ibid, 1838.—On the flax of Courtelam, from the Coromandel Coast ; on the Land-winds of Coromandel, Ibid, vol. iii. 32.—On the Acclimation of extra-tropical Plants, Ibid, vol. v. 39.—On the Cultivation and Preparation of Senna, Ibid, 358. The labours of Dr. Robert Wight were full of value. In 1834 was published the first volume of Wight and Arnott's Prodromus Floræ Peninsulæ Indiæ Orientalis. His smaller work was named Contributions to the Botany of India. From 1838, he began to print the Illustrations of Indian Botany, which were soon after followed by the Icones Plantarum Indiæ Orientalis, and his Spicelegium Neilgherriensis, and in addition many papers appeared in the Madras Journal of Science and in the Calcutta Journal of Natural History. He died at Reading in England, about the 18th June 1872.—*Dr. Buist's Catalogue.*

WIGHTIA. A genus of plants called after Dr. Wight. At Tonglo, in Sikkim, at an elevation of several thousand feet, Dr. Hooker found great scandent trees twisting around the trunks of others, and strangling them ; the latter gradually decay, leaving the sheath of climbers as one of the most remarkable vegetable phenomena of these mountains. These climbers belong to several orders, and may be roughly classified in two groups.—(1.) Those whose stems merely twine, and by constricting certain parts of their support, induce death.—(2.) Those which form a net-work round the trunk, by the coalescence of their lateral branches and aerial roots, &c. : these wholly envelope and often conceal the tree they enclose, whose branches appear rising far above those of its destroyer. To the first of these groups belong many natural orders, of which the most prominent are—Leguminosæ, ivies, hydrangea, vines, Pothos, &c. The inosculating ones are almost all figs and Wightia; the latter is the most remarkable for its grasping roots.—*Hooker Him. Jour. vol.* i. *page* 163-164.

WIKSTRÆMIA SALICIFOLIA. *Dne.*

Thilak,	BEAS.	Bhat-niggi,	RAVI.

A small shrubby plant which occurs sparingly on some of the Punjab rivers in the Himalaya at from 5,500 to 7,000 feet, up to near the Indus ; paper inferior to that from the Daphne is made from its bark in Kumaon, and it furnishes a strong rope at Nynee Tal.—*Dr. J. L. Stewart.*

WIJAO, a sovereign of Ceylon who introduced caste, and which still prevails amongst the buddhist inhabitants, though condemned by the doctrines of their teacher. The Portuguese, Dutch, and British Governments have each tried to eradicate it. The Aggana Suttan, in the Dighanikuya section of the Pittaka, a discourse of Buddha, enforces the eligibility of all classes, however low, to the office of the priesthood, which commands the homage of the highest; and the same doctrine is repeated in the Madhura Suttan. The Wasala Suttan contains a stanza, beginning with "Majachcha Wasala hotin," which runs thus: "A man does not become low caste by birth; nor by birth does one become high caste; high caste is the result of high actions, and by actions does a man degrade himself to a caste that is low." It was found impossible, however, to eradicate it, and caste continued to be tolerated by Singhalese kings as a social institution. In other buddhist countries, Burmah, Siam and Tibet, caste does not exist in any similar form.—*Tennent's Ceylon.*

WILAYAT. Hind. Pers. written also Valayat and Balait, foreign; a foreign country. Vilayati, a foreigner.

WILAYATI BENGAN. Hind. Solanum lycopersicum.

WILAYATI KANTALA. Hind. Agave Americana.

WILAYATI KIKAR. Hind. Parkinsonia aculeata, also Acacia farnesiana.

WILAYATI MENDHI. Hind. Myrtus communis.

WILAYATI NIL. Hind. Prussian blue; also indigo of Bengal, &c., prepared in European factories.

WILAYATI PEORI. Hind. Yellow chromate of lead.

WILAYATI SUN, of Muttra, Hibiscus cannabinus. See Ambari, also Crotalaria juncea, *Linn.*

WILD ALMOND TREE. Terminalia catappa. An oil is said to be obtained from the fruit of this tree.—*M. E. J. R.*

WILD APRICOT. See Clusiaceæ.

WILD BEASTS. The demand for rare animals is constant, the various zoological institutions on the continent of Europe and the exhibitions always wanting new specimens. A good pair of lions are worth £1,000, and will command that price at almost any time. The tiger is more dangerous than the lion, as he seems to add a peculiar cunning to his natural ferocity. Old tigers are the man-eaters. An aged animal, with blunted fangs and dulled claws, too stiff to pasture on antelopes and bullocks, feeds on human beings, a less troublesome prey.

Elephants always find a ready market. About ten a year are taken to England on an average. A good tusker will find a dozen purchasers at £1,000 in London, and dol. 8,000 in the United States. Even a dead elephant will find a buyer at from 100 to 250 dol. The African elephants are by far the finest, being twice the size of their Indian brothers. Elephants, according to age and sex, sell at from 1,900 to 2,500 rupees. Male elephants are troublesome, and sometimes exceedingly dangerous. They seem to be afflicted with a disease of the tusk, which drives them to madness; and so far as observation has gone, are absolutely voiceless. Changes of climate tell on them, and the least cold sensibly hurts them. They are dainty feeders. In America the rhinoceros and hippopotamus sell well always; the sale of a rhinoceros at £1,700 has occurred; the Boers find a market at Cape Town for them.

For exhibition purposes, for vivacity, for good humour, sprightliness and general activity, the South American monkey carries off the palm. The African monkey, larger generally in size, is a stupid fellow when compared with his American brother. The Indian monkey somewhat lifts up the imputation thrown on his African relation, only he has a spitefulness, and a tendency to try his sharp teeth: monkeys are kleptomaniacs. This trait is useful when medicine is to be administered. If you try to give a monkey cod-liver oil with a spoon, it would be an endless job; but fill a vial with it, and hide it, (so that he can see it done,) and the moment you are gone he is sure to swallow every drop. Monkeys in a state of captivity are prone to pulmonary disease, and have a bad trick of nibbling off the ends of their tails.

When in confinement the lioness is not approached until her cubs are fully three or four months old. They are then carefully separated by stratagem, and their weaning commences. About a quart of milk is given per diem, with a small quantum of animal food, in the way of juicy cutlets and titbits, all bone being carefully excluded. The seventh month seems to be one of trial. If they get over that they stand a fair chance of life, though the period of their tooth shedding, when they are a year old, is attended with danger; they sometimes swallow their own teeth, which often kills them. The litters born in travelling menageries appear to have the best chances of life. Of a large number of lion whelps bred in the London Zoological Gardens, most were born with some irregularity of the palatal bone, and the roof of the mouth being defective, the whelps could not suckle. The general disease which carries lions off is congestion of the lungs. The amount of food given to a lion is about thirteen pounds of beef per diem, with bones ad libitum. When fed regularly, they show little disposition to glut themselves, and will rarely exceed fifteen to sixteen pounds when given all they will eat. When horse meat is procurable, they are fed in part with it. Great care is necessary in keeping their cages clean. As they are constantly shedding their hair, an accumulation of this adhering to their food and being swallowed by them, is apt to sicken them. Occasionally, sulphur is sprinkled on their meat, and mild purgatives given them in their water. The largest proportion of lions are brought from the French province of Algeria, and Marseilles mostly has one or two lions on the market,—*New York Times.*

WILD BLACK CARANDAS. Carissa carandas, *Linn.*

WILD BREAD-FRUIT TREE. Artocarpus hirsuta, *Lam.*

WILD CARDAMOM. Elettaria cardamomum, *Wh. and Mat.*

WILD CARDAMOMS. Bastard cardamoms.

WILD CINNAMON. Cinnamon iners, *Rein.*

WILD-CLOVE TREE. Eugenia acris, *W. and A.*

WILD COTTON. Eriophorum.

WILD CROTON. See Croton.

WILD CUMMIN SEED. Vernonia anthelmintica.

WILD DATE. Elate sylvestris, syn. of Phœnix sylvestris, *Roxb.*

WILD DOLICHOS. Dolichos pilosus.

WILD DUCKS. Amongst the Arabs the person who is in search of waterfowl, strips, puts seaweeds upon his head, and approaches the bird. The duck, not being alarmed at the sight of the seaweeds, does not stir till the Arab seizes it by the feet.—*Niebuhr's Travels, vol.* i. 233. See Waterfowl.

WILD ENDIVE. Cichorium intybus.

WILD FIG. Ficus macrophylla, *Clegh.*

WILD GOURD. See Colocynth.

WILD INDIGO. See Indigofera.

WILD IPECACUANHA. Asclepias currasavica, *Linn.*

WILD IXORA. Ixora pallens.

WILD-LIME. Eng. Atalantia monophylla.

WILD LIQUORICE. Abrus precatorius.

WILD MANGOSTEEN. Embryopteris glutinifera, *Roxb.* Garcinia purpurea ?

WILD PEPPER. See Pepper.

WILD RAMBUTAN. Nephelium.

WILD RASPBERRY. Rubus gooreephul.

WILD SAPOTA TREE. Bassia longifolia, *Willde.*

WILD SARSAPARILLA. Smilax ovalifolia.

WILD SHEEP OF TENASSERIM. See Capreæ.

WILD STRAWBERRY. Fragaria vesca, *Linn.*

WILD SUCCORY. Cichorium intybus.

WILD SWORD-BEAN. Canavalia virosa.

WILD YAM. Dioscorea dæmona.

WILFORD, Colonel, an officer of the East India Company's Bengal Army. In the English burial-ground at Sechole, the most interesting monument is that of Colonel Wilford. The hindoo nation has reason to venerate the memory of that indefatigable Sanscrit scholar, who had almost hindooized himself by a residence in Benares from 1788 to 1822, and who at length mingled his dust in the soil of that great seat of brahminical learning.—*Tr. of Hind. vol.* i. *p.* 285.

WILI. Hind. of Kanawar. Olea Europea, O. ferruginea and O. cuspidata. Olive.

WILKINS. The first European who acquired a knowledge of the Sanscrit language. He translated the Hitopadesa from the Sanscrit.—*Rennell's Memoir, p.* 332.

WILKS. Lieut. Col. Mark, Author of Historical Sketches of the South of India, Lon. 1817, 3 vols. 4to—Translation of an Inscription on a Tambu Paka. Ibid, vol. viii. 736—History of Mysore, Lond. 1810.—*Dr. Buist's Cat.*

WILLA. Hind. also Khar willa, "big willow." Pshtu. Salix Babylonica, the Weeping willow.

WILLAITI-MUNG. Guz. Ground nut. Arachis hypogea, *Linn.*; *W. and A.*; *R.*

WILLOUGHBY. A lieutenant of the Bengal army, an indomitable officer, on the 11th of May 1857, with a mind capable of conceiving, and a heart and hand resolute and steady to perform, he blew up the magazine at Delhi.—*Tr. of Hind. v.* ii. *p.* 361.

WILLOW. A species of willow, is one of the most abundant forest trees of Tenasserim on the banks of inland sreams ; as many of the willows are medicinal, it is very probable that this also possesses medicinal properties. Roxburgh describes a species of willow as "a native of banks of rivulets and moist places among the Circar mountains," but a species of willow on the Tenasserim coast is met on every stream before the influence of the tide ceases to be felt. Willow bark contains, according to Davy, 2·3 per cent. tannin, and that of the Leicester willow 68 per cent. Danish leather which has a peculiar and agreeable odour, and is used for making gloves, is prepared from kid and lamb skin, by means of willow bark, which is also used in the preparation of Russia leather, but the odour of that leather is produced by the oil of birch-tree bark. In Britain, imported barks are all free of duty.—*Dr. Mason's Tenasserim.*

WILLOW-LEAVED ALLAMANDA. Allamanda cathartica, *Linn. Kœn.*

WILLOW-LEAVED JUSTICIA. Justicia gandarussa.

WILLUGHBEIA, a small East Indian genus of plants belonging to the natural order Apocynaceæ, named after Francis Willughby, F. R. S.—*Eng. Cyc.*

WILLUGHBEIA EDULIS. ROXB.

Luti-am, HIND.

A very large climber, in the forests of Chittagong and Sylhet: every part of the plant on being wounded discharges an abundance of fluid caoutchouc. The fruit is pulpy, soft, and yellow, and esteemed by the natives. This seems the same as that named by Dr. Mason, Willughbeia Martabanica of the forests of Tenasserim, which he says produces a fruit as large as an apple, which Europeans sometimes call a kind of fig. It has an agreeable taste, but abounds in a milky juice. Its colour is yellow, and it is about the size of an orange. —*Roxb. Fl. Ind.* ii. *p.* 67. *Mason. O'Shaughnessy, p.* 448.

WILLUM-MIN. TAM. Willum matchi, DUK. Sable fish.

WILSON. HORACE HAYMAN, went to India, in September 1808, as an Assistant Surgeon on the Bengal Establishment. As he had qualified himself by a knowledge of chemistry and of the practical analysis of metals for the duties of assay, his services were withdrawn from the usual career of medical men in India, and he was at once attached to the mint at Calcutta, in association with Dr. Leyden, then next to Henry T. Colebrooke, the most distinguished orientalist in India. This association, and the encouragement H. H. Wilson afterwards received from Henry T. Colebrooke, gave, apparently, the direction to his studies, which, being consistently carried through more than half a century, placed him at last in the proud position of being acknowledged the highest authority of the day upon all questions of Sanscrit literature and of Hindu theology and antiquities, as well as of the customs and social habits of the races through which that literature and religion had come down to us in the present generation. Upon the decease of Dr. Hunter in 1811-12, H. H. Wilson, already known as a proficient in Sanscrit literature, was appointed to be the Secretary of the Asiatic Society of Bengal. In 1813 he published a poetical translation of the Megha Duta, an epic poem of Kalidasa, which obtained a world-wide reputation, and he undertook the laborious task of preparing for the press, from materials collected by Colebrooke, a dictionary of the Sanscrit language with English interpretations. This was completed in 1819, and a second edition was published in 1832. It has been the key by which mainly the learned of Europe have obtained access to this branch of literature; and the lexicographer to whom all acknowledge such obligations, took at once a high position among the scholars of the age. The earliest article by H. H. Wilson in the volumes of the Asiatic Society of Bengal was published in 1825. It was on the History of Kashmir from the Raja Tarangini and other authorities; it attracted much attention, and was speedily translated and republished in Paris, and it is, to this day, largely cited. Every subsequent volume of the Researches of this Society contains more than one contribution from his prolific pen, and while he remained in India, he was recognised as the worthy successor there of Sir William Jones and of Colebrooke, in the paths of research which they had laid open to the world, and had shown to be so rich in the treasures of curious knowledge. In association with Dr. Atkinson, he established a periodical, which was not, however, very long continued. He compiled, in 1827, a History of the first Burmese War; and was employed by the Government of India in preparing a catalogue of the manuscripts collected by Colonel Colin Mackenzie in the south of India. In 1834, he published separately, under the title of the Hindu Theatre, a translation into English, with preliminary essay, of four Sanscrit dramas of antiquity. The work was received with much astonishment, and with very general favour: for the dramas were found to possess much artistic merit in the combination of incidents, and in the exhibition of character; one especially, the Mrichehakati, or Play of Go-Cart, was of peculiar interest, as a representation of the manners and habits of thought, and condition of society in Central India, at a very remote period. These four dramas, with the Sacuntala, previously translated by Sir William Jones, are among the most curious relics of Indian antiquity that have yet been discovered and laid before the world. The above were, as is of necessity the case in India, where literature is not a separate profession, the produce of leisure hours, not exacted by the conscientious discharge of efficient duties. The Assay Office of the Calcutta Mint, united with that of Secretary to the Mint Committee, gave H. H. Wilson constant occupation for a considerable portion of every day. His duties in these offices were as important as they were useful and laborious, and performed not only with credit, but in a manner to give him high distinction. The Government of India had frequent occasion to acknowledge its obligation to its learned Assay Master and Mint Secretary, for reforms introduced into the coinage, and for other departmental services of eminent public merit. But neither official duties, nor literary pursuits, nor both these combined, were sufficient for the active mind of Professor Wilson at this period of his life. As a member of society, he joined with ardour in every scheme of public amusement; and was besides, the originator and promoter of many measures for the permanent improvement of the people among whom his lot was cast. The Theatre of Chowringhee owed for many years its success to his management and histrionic talents; while his musical skill and proficiency gave him a place in every concert. But his name will live in India, and especially in Bengal, for the part he took in promoting useful instruction. H. H. Wilson was the first person who introduced the study of European science and English literature into the education of the native population, whose knowledge of English had hitherto been confined to qualification for the situation of an office clerk. For many consecutive years Wilson was the Secretary to the Committee of Public Instruction at Calcutta, and he devoted himself especially to directing the studies of the Hindu College, from the date of its establishment; and it was here first that the native youth of India were trained to pass examinations that would not have discredited first-class seminaries of England. In 1833, the University of Oxford having, through the magnificent bequest of Colonel Boden, established a Professorship of Sanscrit, Mr. Wilson was selected for that liberally endowed situation, as a tribute to the reputation won by his literary works and the eminent position he occupied among oriental scholars. He returned soon after to England, and was appointed also to the office of Librarian to the East India Company in succession to Dr. Wilkins. Thus placed in England, in a position of pecuniary independence, he entered upon the career of usefulness and literary distinction which reflected so much further honour upon himself. Scarcely a journal was published by the Royal Asiatic Society, but was not enriched by an essay, or critique, or disquisition from his prolific pen; and his services at the meetings, and ready aid in promoting every useful object, and means of extending information upon oriental subjects, were very great. The separate works published by H. H. Wilson after his return from India are numerous and highly valuable. They have all aimed at the wider spread of knowledge in the lore which he had so thoroughly mastered,—like his essays and translations of the Vedas and Puranas;—or like his Sanscrit Grammar, and Glossary of Indian Terms, for the useful purposes of instruction;—or like his edition and continuation of "Mill's History of British India;"—or, like his Ariana Antiqua, on the antiquities and coins of Afghanistan, with the higher aim of producing a lasting record for the information of the world at large. It was the distinguishing characteristic of Professor H. H. Wilson that he considered nothing unworthy of his labours that was calculated to be useful; and was never influenced in his undertakings by the mere desire of acquiring distinction, or increasing his fame. Many of these works exhibit powers of illustration and close reasoning which place their author in a high position among the literary men of the age. But it is as a man of deep research, as a Sanscrit scholar and orientalist, as the successor of Sir William Jones and H. T. Colebrooke, and inheritor of the pre-eminence they enjoyed in this particular department of literature, that his name will live among the eminent men of learning of his age and country. He died A. D. 1860. His activity may be estimated by the following summary. He was Secretary of the Bengal Asiatic Society till 1832; Professor of Sanskrit in Oxford; Director of Royal Asiatic Society; Librarian of E. I. C: Sanskrit Dictionary Calcutta, 2nd edn.—Remarks on Sanskrit inscriptions in Bl. As. Trans. vol. xv.—Account of Hindu remains at Chattisgher, Ibid.—Sketch of the religious sects of the Hindus, Ibid, vols. xvi. and xvii.—Sanskrit inscriptions at Abu, Ibid, vol. xvi.—Notice of three tracts from Nepal, Ibid.—Description of select coins. Ibid.—Remarks on Dionysiacs of Nonnus, Ibid.—Translation of inscriptions at Vijayaganagar, Ibid vol. xx.—Various papers in Quarterly Oriental Magazine.—Megha Duta, translated into English verse, with Sanskrit text.—Specimens of Hindu Theatre, 2 vols.—Descriptive Catalogue of Mackenzie Collection of Oriental

MSS. 2 vols.—On Thibetan Literature. Gleanings in Science.—The Sankhya Karika system of Philosophy.—The Vishnu Purana translated.—Proverbs, Persian, Hindustani and English.—Lectures on religious belief and practices of the Hindus, Oxford, 1840.—Historical sketch of Burmese War. 2nd edn.—Review of External Commerce of Bengal. Calcutta.—Travels of Moorcroft and Trebeck. Lond.—Mill's History of British India, edited with continuation. Lond.—Ariana Antiqua; Antiquities and Coins of Affghanistan. Lond. 1841.—Grammar of the Sanskrit language. Lond.—Papers in Bl. As. Trans. the most important of which, on the Puranas, have been reprinted in Lond. As. Trans.—Historical sketch of kingdom of Pandya. Lond. As. Trans. vol. iii. 1836.—Essays on the Puranas, Ibid, vol. v.—Notes on the Sabha Parva of Mahabharata. Ibid, vol. vii. 1843.—Translation of Mir Izzet Ullah's travel beyond the Hymalayas, Ibid.—Note on the Kapur-di-Giri inscriptions. Ibid, 1846, vol. viii.—Summary account of the Sikhs. Ibid, 1847, vol. ix.—Religious Festivals of the Hindus. Ibid.—On the rock inscriptions of Kapur-di-Giri, Dhanto, and Girnar Ibid, vol. xii. 1849.—On the Sacrifice of human beings as an element of the ancient religion of India. Ibid, vol. xiii. 1851.—Glossary of Indian terms, 4to. London, 1856. He published in 1832 the second edition of his Sanscrit and English Dictionary, in 1827 his select specimens of the Theatre of the hindus, in 1837 published Mr. Colebrooke's translation of the Sankhya karika, in 1840, his translation of the Vishnu Purana, and in 1850-1857, three volumes of his translation of the Rig-Veda.

H. H. Wilson, in 1819, translated from the Mahabarata the story of Nala and Damayanti. He and James Prinsep prepared for the press the whole text of the Mahabharata, which was printed in Calcutta in four quarto volumes; he aided in the translation of all the chief portions of the Puranas, Mahabharata and Ramayana, a copy lodged in the India Office, one at Oxford, and one at Edinburgh. H. T. Colebrooke, H. H. Wilson, Max Muller, Benfey, Haug, John Muir, Cowell, Witney, Rejendr Lal Mitra, have all translated parts of or expounded the Vedas.—*Dr. Buist's Catal.*

WILSON, Reverend John, D. D., an eminent missionary and scholar from the Church of Scotland to Bombay. Author of a Pamphlet on Missions, Edin. 1827.—Life of John Eliot. Edin. 1828.—Moral conquest of the world, Discourse, Bombay, 1830.—Debate with Brahmans, separately in English and Marathi, and in Oriental Christian Spectator, vol. i. 1830.—Address to Seamen at Bombay, 1831.—Rudiments of Hebrew Grammar in Marathi, Bombay, 1832.—Exposure of Hindooism, Bombay, 1832.—Idiomatical Exercises, English and Marathi (3 editions) Bombay, 1833—1851.—Lecture on the Vendidad Sadi of the Parsis, Bombay, (2 editions) 1833.—Refutation of Muhammadanism, in Oriental Christian Spectator, 1833, and separately in Hindustani and Persian, (2 editions) Bombay, 1834, 1840.—Second Exposure of Hinduism, separately in English and Marathi. Bombay, 1834.—Sermon on the death of Mrs. Wilson, Bombay, 1835.—Tour to Goa and Southern Maratha country, Oriental Christian Spectator, 1834.—Address before Bombay Branch of Royal Asiatic Society on his election as its President, Bombay, 1835; Bl. As. Trans. 1835; Lond. As. Trans. vol. iii. 1836.—Journal of Tour in Gujarat, Kathiawar, and Kach. Reprinted from Oriental Christian Spectator, 1835.—Letter to Jaina priests of Palitana, from Journal, translated into Gujarati. (3 editions) Bombay, 1835, 1837, 1852.—Discourse on the British Sovereignty in India. (3 editions) Bombay, 1835, and Edin. 1837.—Memoir of Mrs. Wilson, (4 editions) Edin. 1837—1847.—Translation of the general Sirozeh of the Parsis. Lond. As. Trans. 1837, vol. iv.—Letter to Mr. J. Prinsep on Girnar Tablets, As. Trans. 1838.—Account of a visit to the Falls of the Sharavati, (near Girsipa.) Jameson's Phil. Jl. 1838.—Note on the worship of Vetal, Lond. As. Trans. vol. v. 1839.—Sermon to the Parsis, with an account of their settlement in India, &c. WINDS. Ever since the magnificent generralisation which was given to the world in 1831 by Mr. Redfield of New York, the mariner has ceased to tremble before the fall of the quicksilver in his barometer, and the other premonitions of the hurricane. This meteorologist established the fact that storms seemingly the most violent and lawless, moved with precision in fixed paths, and executed their rotative movement with almost the regularity of the balance wheel. He also demonstrated that hurricanes in the northern hemisphere revolve around their centre invariably in a direction contrary to the motion of the sun and the hands of a watch. This physical law, now so well known as the law of storms, in countless cases has saved large vessels, and even whole squadrons, from probable destruction. Captain Douglas Wales of the Mauritius, a sailor of experience and great practical knowledge and skill, in a paper on the converging of the wind in cyclones, argues that on the margin of these storms, whose diameter is often several hundred miles, the wind does not always blow around the central area of the storm in concentric circles, but frequently it converges or curves inward, in nearly radial lines, upon the centre of the gale. As it is in the centre that the verticose motion of the cyclone is most intense and deadly, it is, of course, of the first importance to give it a wide berth. According to the law of storms, at first laid down by Messrs. Redfield, Reid, Dove, and others, the winds within the entire area of atmospheric disturbance blew in perfect and concentric circles around the common centre. Captain Wales, however, after multiplied observations, shows that this rule is not strictly observed by the winds. The important fact now announced does not at all overthrow, but confirms Mr. Redfield's, discovery, and, by giving greater practical value to the latter, it will mark a new era in navigation, as well as in the science of cyclonology. The converging of the wind towards the centre of the revolving gale is, of course, due to the centrepetal force being greater than the tangential force, which is the fact observed in tornadoes.

The *dust storms* of India sweep along the surface of the ground sometimes for two or three hundred miles, and cause much inconvenience. A duststorm is thus described. Suddenly, without any warning, there appeared a wall of cloud in the north-west, which rapidly advanced. It looked from 70 to 100 feet in height, but was in reality much higher, and its colour was a deep purple, glowing with a kind of brick-dust red; and it terminated above in a definite horizontal line cutting the clear sky. But in infinitely less time than this takes to tell, it was upon us—a fearful strain on the window, and we were in pitchy darkness. It was almost a darkness which might be "felt;" and one could not see one's hand. Meanwhile the fine sand poured in as water by every crack, into the room, in which we all stood in silence for a few minutes until the first force of the storm was over. It soon after became a little lighter, and the air was perceived to be filled with bits of straw, leaves, and fragments of light substances of various descriptions, which had been collected by the storm and stayed by the trees. Blast followed blast; and then came a sound of rain, torrents of which fell for about half an hour. Immediately afterwards there arose that refreshing scent of wet earth given forth as incense by the grateful soil; and then, with every window opened, we were inhaling the freshened air. In three-quarters of an hour all was over. Nearly all the fruit in the garden had been blown off, and many trees stripped of their leaves; many a mighty tree had given tribute to the storm king in the shape of huge boughs, many a thatch had flown afar; but there can be no doubt that the air was changed and purified, and that the good done far outweighed the evil.

Hail-storms are dreaded in India, as the hailstones are often very large, and sometimes kill man and beast, as well as destroy much of the crops.

In the Red Sea, the winds are either northerly or southerly; the wind from May to November is northerly, and the other six months is southerly, but there are also land and sea breezes.

In the *trade-wind* regions at sea, evaporation is generally in excess of precipitation, while in the extra-tropical regions the reverse is the case ; that is, the clouds let down more water there than the winds take up again ; and these are the regions in which the Gulf stream enters the Atlantic. Along the shores of India, where experiments have been carefully made, the evaporation from the sea amounts to three-fourths of an inch daily. The effect of diurnal rotation upon the currents of the sea is admitted by all—the trade-winds derive their easting from it—it must therefore extend to all the matter which these currents bear with them, to the largest iceberg as well as to the merest spire of grass that floats upon the waters, or the minutest organism that the most powerful microscope can detect among the impalpable particles of sea-dust. Investigations show that in the Atlantic Ocean the south-east trade-wind region is much larger than the north-east, that the south-east trades are the fresher, and that they often push themselves up to 10° or 50° of north latitude, whereas the north-east trade-wind seldom gets south of the equator. The peculiar clouds of the trade-winds are formed between the upper and lower currents of air. The zone of the north-east trades extends on an average from about 29° north to 7° north. And if we examine the globe, to see how much of this zone is land and how much water, we shall find, commencing with China and coming over Asia, the broad part of Africa, and so on, across the continent of America to the Pacific, land enough to fill up, as nearly as maybe, just one third of it.

The Andes, and all other mountains which lie athwart the course of the winds, have a dry and rainy side, and the prevailing winds of the latitude determine which is the rainy and which the dry side. The weather side of all such mountains as the Andes is the wet side, and the lee side the dry. Were the Andes stretched along the eastern instead of the western coast of America, we should have an amount of precipitation on their eastern slopes that would be truly astonishing ; for the water which the Amazon and the other majestic streams of South America return to the ocean would still be precipitated between the sea-shore and the crest of these mountains. The same phenomenon, from a like cause, is repeated in inter-tropical India, only in that country each side of the mountain is made alternately the wet and the dry side by a change in the prevailing direction of the wind. India is in one of the monsoon regions, it is the most famous of them all. From October to April the north-east trades prevail. They evaporate from the Bay of Bengal water enough to feed with rain, during this season, the western shores of this bay and the Ghaut range of mountains. This range holds the relation to these winds that the Andes of Peru hold to the south-east trades ; it first cools and then relieves them of their moisture, and they tumble down on the western slopes of the Ghauts, Peruvian-like, cool, rainless, and dry ; wherefore that narrow strip country between the Ghauts and the Arabian Sea would, like that in Peru between the Andes and the Pacific, remain without rain for ever, were it not for other agents which are at work about India, and not about Peru. The work of the agents to which allusion is made, is felt in the monsoons, and these prevail in India, and not in Peru, and may now be explained after the north-east trades have blown out their season, which in India ends in April. The great arid plains of Central Asia, of Tartary, Tibet, and Mongolia, become heated up ; they rarefy the air of the north-east trades, and cause it to ascend. This rarefaction and ascent, by their demand for an indraught, are felt by the air, which the south-east trade-winds bring to the equatorial doldrums of the Indian Ocean ; it rushes over into the northern hemisphere to supply the upward draught from the heated plains, as the south-west monsoons. The forces of diurnal rotation assist to give these winds their westing. Thus the south-east trades in certain parts of the Indian Ocean, are converted, during the summer and early autumn, into south-west monsoons. These come from the Indian Ocean and sea of Arabia loaded with moisture, and striking with it perpendicularly upon the Ghauts, precipitate upon that narrow strip of land between this range and the Arabian sea an amount of water that is truly astonishing. There are, thus, not only the conditions for causing more rain, now on the west, now on the east side of this mountain range, but the conditions also for the most copious precipitation. Accordingly, when we come to consult rain gauges, and to ask meteorological observers in India about the fall of rain, they tell us that on the western slopes of the ghauts it sometimes reaches the enormous depth of twelve or fifteen inches in one day.

These S.W. monsoon winds of India continue their course to the Himalaya, dropping moisture along their course, and in crossing this range, they are subjected to a lower temperature than that to which they were exposed in crossing the Ghauts. Here they drop more of their moisture, in the shape of snow and rain, and then pass over into the thirsty lands beyond with scarcely enough vapour in them to make even a cloud. Thence they ascend into the upper air, there to become counter currents in the general system of atmospherical circulation.

The greatest rainfall occurs on the slopes of those mountains which the trade-winds first strike, after having blown across the greatest tract of ocean. The more abrupt the elevation, and the shorter the distance between the mountain top and the ocean, the greater the amount of precipitation.

Writing on the amount of *evaporation* that goes on, Dr. Buist in his annual report to the Bombay Geographical Society states, on the authority of Mr. Laidly, the evaporation at Calcutta to be about fifteen feet annually; that between the Cape and Calcutta it averages, in October and November, nearly three-fourths of an inch daily; between 10° and 20° in the Bay of Bengal, it was found to exceed an inch daily. Supposing this to be double the average throughout the year, we should, continues Dr. Buist, have eighteen feet of evaporation annually.

Land and Sea Breezes occur on the seaboard of all tropical countries, and on all islands in the tropics. Upon the northern coast of Java, the phenomenon of daily land and sea breezes is finely developed. There, as the sun rises almost perpendicularly from the sea with fiery ardour, in a cloudless sky, it is greeted by the volcanoes with a column of white smoke, which, ascending from the conical summits high in the firmament above, forms a crown, or assumes the shape of an immense bouquet that they seem to offer to the dawn; then the joyful land-breeze plays over the flood, which, in the torrid zone, furnishes, with its fresh breath, so much enjoyment to the inhabitants of that sultry belt of earth, for, by means of it, everything is refreshed and beautiful. The transparency of the atmosphere is so great there that they can sometimes discover Venus in the sky in the middle of the day. In the rainy season the land looms very greatly, and mountains which are from 5000 to 6000 feet high are visible at a distance of 80 or 100 English miles.

Typhoon is the European name of the frightful equinoctial gales which vex sea and land about the tropics in the Eastern seas, and down as far as to 10° from the equator. The whole Malayan Archipelago is excluded from their sphere, while the whole of the Philippines is within it, the island of Mindano alone excepted. Typhoon is, however, said to be a word of Chinese origin, from Ta, great, and Fung, tempest. It may, however, also be from the Arabic, Tufan, a storm, and that from the Arabic root, Taof, he did turn. Typhoons, cyclones and tornadoes are great rotatory winds that move along a curved line in increasing circles, sometimes centripetal. In the northern hemisphere, the rotatory movement follows a direction contrary to that of the hands of a clock; while the opposite takes place in the southern hemisphere. In maritime language, tyfoons are dangerous tempests which occur in the northern part of the China sea, along the southern and eastern coast of China, near Formosa, the Bashee Islands, the north end of Luconia; also to the eastward of those islands, and betwixt Formosa and the Japan Archipelago. These tempests usually blow with the greatest fury near the land: as the distance is increased to the south-ward from the coast of China, their violence generally abates, and they seldom reach beyond lat. 14° N., although a severe gale has been experienced at times two or three degrees further to the southward. They occur in both monsoons.

Hail-storms are of frequent occurrence in the central parts of India, and often cause much injury.

Sudden storms are common throughout India in the spring. For an hour before sunset, clouds are gathered in the western horizon, which is illuminated with repeated flashes of lightning accompanied with a continued muttering of distant thunder, the atmosphere becoming oppressively sultry. Suddenly the heavens are furiously agitated, a brightening space is seen on the horizon, and they appear rapidly diverging from it as from a centre. A few large drops of rain are dashed downwards with great violence, a whirlwind rises almost instantly, and blows as if it blew its last, with a violence to which Europe is a stranger. The rain then falls as if a deluge were commencing, sudden and terrific crashes of thunder are heard above and around, and hailstones such as we have read of are often precipitated with most injurious effect. The violence of the storm is generally exhausted in about half an hour.

With the hindus, vayu, or the air, and the maruts, or winds, are personified and invoked. The maruts are depicted as roaring amongst the forests, compared to youthful warriors bearing lances on their shoulders, delighting in the Soma juice like Indra, and, like him, the bestowers of benefits on their worshippers.—*Maury, on the Physical Geography of the sea, pp.* 17, 25, 74, 88. *Horsburgh. Vigne's a Personal Narrative, p.* 33-4. *New York Herald.* See Cyclones, Gales, Hail, Hurricanes, Rains, Typhoons, Whirlwinds.

WINDOWS, in eastern countries, are mostly holes in the walls, as in Acts xx. 9, sufficiently low to admit of the outlook. See *Judg.* v. 28, *Pro.* vii. 6. *Cant.* ii. 9.

The wines known to Europeans in south-eastern Asia are almost exclusively the product of Europe; little of the wines from the Cape of Good Hope, from Shiraz in Persia, or from Australia, is used. The palm wines, the fermented sap of the several species of palms, are very extensively used by all classes of natives in the palm regions of the south and east of Asia, but by Europeans they are almost untasted. Kashmir is the only part of British India where wine is made from the juice of the grape, a fact to be attributed rather to its acescent quality than to any scarcity of the fruit. It is described by Foster as resembling that of madeira, and he presumes it would be found to improve greatly in quality by age. To the proper radiation of the heat in this elevated region, and its vicinity to the lofty mountains of Tibet, it may be reasonably concluded much of the acidity would be found in all the fruits which so greatly adds to their taste and flavour in the temperate climates of the north. As there is a limit beyond which the vine cannot pass, or rather where the acid properties exceed the limits necessary to the perfection of the fruit, there is also an excess of the saccharine principle in tropical countries, which precludes the application of the fruit to the manufacture of wine. In such instances, the vinous particles are concentrated, and fruit of every kind is fit for spirituous liquor only.

The Chinese in the cold weather drink a fair quantity of wine, but are seldom addicted to drunkenness. Their wines are crude spirituous liquors, almost altogether unrefined, distilled from rice, millet, barley and other fermented grains, and the process of distilling seems to have been perfected during the Mongol dynasty. Grape wine was originally brought from certain volcanic districts in Turfan, which has prejudiced the Chinese against it, as they consider it heating. A wine, flavoured with sandal-wood, brought from Siam, was formerly in great repute. The celebrated Cheh-kiang wine called "Shau-hing-tsiu," is wholesome and in great repute throughout China: it has a yellowish colour and sour flavour. The "Yuen-hwa-tsiu" is a weak white wine or spirit, flavoured with the flowers of the Passerina chamædaphne, and reputed to be tonic. The "Kwei-yuen-tsiu" is a red wine. The "Pih-luh-tsiu" is a greenish coloured wine or spirit, resembling a cordial, made at Peh-chih-li and Hupeh. The "Fen-tsiu" is a kind of strong whiskey, originally distilled in Fen-chau-fu in Shansi. The wines of China are taken warm, very soon redden the face, and culminate in evanescent stimulation. There are a great many varieties of European wines, occasioned by differences of soil, climate, mode of preparation; but the chief are port, sherry, claret, champagne, madeira, hock, &c., and all of them are used by the Europeans who reside in the south and east of Asia.

Persia is supposed by some to be the native country of the vine; and this opinion seems to receive confirmation from the extraordinary perfection to which its fruit there attains. Grapes, says Oliver in his description of the country round Ispahan, everywhere abound, and their quality is excellent. None of those which I had tasted at Constantinople, in the islands of the Archipelago, Crete or Cypress, in Syria, in Provence, or in Italy, appeared to me comparable to the Kismis grape, of which the berry is white, of an oval shape, and middling size, having a very delicate skin, and no seeds. At Shiraz, they are described as growing "to a size and fulness hardly to be matched in other climates." "But, according to Mr. Morier, even grapes of Shiraz are surpassed in quality by those of Casvin. That city," he observes, "is environed by vineyards and orchards to a considerable extent, the former of which yield a grape celebrated throughout Persia for the good wine it produces. The vine-dressers water their vines once in the year, which is twenty days after the festival of the Noroz, about the 10th of April; and the vizir mentioned that the soil, which is clayey, is so good, that the moisture it imbibes suffices until the next irrigation."

The mahomedan religion prohibiting the use of wine to its followers, tends to restrict the manufacture to those places in S. Asia where the Jews, Armenians, or Hindoos form part of the population. But the Persians have always been less scrupulous observers of this precept of the Koran, than the other mahomedans; and several of their kings, unable to resist the temptation, or conceiving themselves above the law, have set an example of drunkenness which has been very generally followed by their subjects. We learn from Chardin and Tavernier, that Shah Abbas II. was much addicted to wine, and made his courtiers share in his cups. His cellars were abundantly stocked with the choicest vintages of Georgia, Karamania, and Shiraz, preserved with great nicety in bottles of Venice crystal; and every six weeks, he received from the first of these countries a supply of twenty chests, each of them containing ten bottles, and each bottle about three quarts. He had also, at different times, wines sent him from Spain, Germany, and France; but he drank only those of Persia, thinking them preferable to all others. A particular officer was appointed to superintend his wines, and to watch the proceedings of all those who made or sold that commodity; no one being permitted to engage in the trade without an express licence, which was only to be obtained by dint of bribery. At present many Persians indulge secretly in wine, and generally to intemperance; as they can imagine no pleasure in its use, unless it produce the full delirium of intoxication. They flatter themselves, however, that they diminish the sin, by drinking only such as is made by infidels: for "so great is the horror of a mahomedan vintage," as a late traveller informs us, "that whenever jars of the wine of Shiraz are discovered, the chief officers of the town are ordered to see them broken to pieces. But all this strictness relates to the Persians alone. The Jews and Armenians prepare wine on purpose for the mahomedans, and add lime, hemp and other ingredients to increase its pungency and strength; for the wine that soonest intoxicates is accounted the best, and the brighter and more delicate kinds are held in no estimation among the adherents of Mahomed. It is chiefly along the line of mountains that stretch from the Persian Gulf to the Caspian Sea, that the best wine districts are situated. Besides the vintages of Shiraz, those of Yezd, Ispahan, &c., are mentioned with commendation by Chardin; and recent travellers add to the list the growths of Teheran, Tabriz, and Casvin. But few of these wines, except the Shiraz, are much known out of the country where they are produced; and even the last mentioned no longer maintains the high celebrity which it formerly enjoyed. Tavernier estimated the quantity annually made at four thousand one hundred and twenty-five tuns, of which a considerable portion was shipped for the East Indies; but both the manufacture and trade in the commodity have declined after the wines of Madeira came into general use in Asiatic territories.

The principal vineyards in the environs of Shiraz are situated at the north-west of the town, where the soil is rocky and the exposure extremely favourable. The vines are all kept low but occasionally supported by stakes. Among the species cultivated, one of the most esteemed is the Kismis, the fruit of which, having an agreeable acidulous taste, is in great request for the table, as well as for the manufacture of wine, and when dried, forms an excellent substitute for currants. Next to it comes the angoor asji, a black or dark purple grape more fleshy than the other, and yielding an excellent red wine, of a deep red colour and somewhat astringent taste, which Kæmpfer compares to Hermitage: but the quantity made is small. For the more common wines, or those which most frequently come into the market, five different kinds of grapes are used, of which four are white or brown, and the fifth, called *Samarcandi*, from the town of that name, has a black skin with red juice, and furnishes a claret wine. At Ispahan a muscadel grape is grown, which yields a copious supply of must. In the manufacture of their wines, when the grapes are gathered, they are brought to the cellar, and introduced into a vat or cistern formed of masonry and lined with plaster, about eight feet in length and breadth, and four in depth, where they are trodden; and the juice that flows from them is collected in a trough at the bottom, from which it is immediately removed into large earthen jars, to undergo the requisite fermentation. These jars, which contain from sixty to eighty gallons, and are either varnished in the inside, or rendered impervious by a coating of grease, are carefully covered, and left undisturbed for a couple of days. When the fermentation has fairly commenced, the musk is stirred by one of the workmen with his arms bare; and this operation is repeated for eighteen or twenty successive days. The wine is then strained through coarse seives, into clean vessels, which are filled to the brim, and covered with light matting. In these it is allowed to remain for thirty or forty days, and when the secondary fermentation is thought to be completed, it is racked into smaller jars or bottles, in which it can be conveniently transported. That which is destined for exportation is strained a second time. The larger bottles, called *Karaba*, are covered with wicker work, and hold eight or nine gallons,—the smaller, six or seven quarts. They are packed in chests, which generally contain ten small bottles, or two *karaba*, and one small bottle between. The bottles are stopped with cotton, soaked in wax or pitch.

Chardin found the Shiraz wine of excellent quality; and though inferior in delicacy to the vintage of his own country, and at first somewhat rough to the taste, yet after drinking it for a few days, he relished it so much as to give it the preference to all other wines. He admits however, that it does not keep well, being liable to ropiness after the second year; and that, when drunk freely, it is apt to cause headache. Kæmpfer extols it more highly, placing it in point of flavour and aroma, on a level with the best growths of Champagne and Burgundy, and contradicting the assertion that it incommodes the head. Since these travellers wrote, and since Hafiz sung the praises of the ruby wine of Shiraz, the declining demand, and the difficulties opposed to the manufacture, have probably tended to impair the quality; for we are told, that, at the present day, "the culture of the vine itself is comparatively neglected at Shiraz: the sorting of the fruit is a delicacy seldom attended to; and the apparatus used in the compression, fermentation, &c. of the juice, is on so confined a scale, that only small quantities of the esteemed flavour are obtained. Indeed, no wine, under one name, possesses such variety of quality; every gradation, from a liquid, clear as the most brilliant topaz, to a sour and muddy syrup. When good, the taste should be a little sweet, accompanied with the flavour of dry Madeira, to which, when old, it is not at all inferior.

This description of the colour and flavour of the Shiraz wine, however, applies only to the white sort, which, even when of firm and generous quality scarcely deserves to be ranked on a par with the best growth of Madeira; some samples of it betray a slight taste of saffron, which is not unfrequently added by the Armenian manufactures to their wines, in order to please the eye as well as palate of their customers. The other kind, which is probably the bright-red wine described by Chardin, resembles tent, or the second rate sweet wines of the Cape, and occasionally tastes a little of the pitch used for stopping the bottles in which it is exported. It is not so durable as the white.

Port wine, as introduced into India, is mostly adulterated with the raw spirit exported from England, and a fifth part of even good port consists of proof spirit, costing at about the rate of three farthings a bottle. Port wine that has not been brandied for the English market has 23½ per cent. In all pure wines, the natural proportions of proof spirit is usually from 18 to 22 per cent; many contain 18 per cent; some reach 25 or even 27, and in rare instances even 32 per cent. Since the vine disease, really good ports and sherries have almost doubled in price; and, at prices below five, six or seven shillings a bottle, they are factitious wines, incomparably worse than many a pure wine of France, Hungary, Austria or Greece, of which a choice quality is to be had for half the money. Beer is the best cheap drink for healthy folks who take active outdoor exercise, but with many fair haired people with florid complexions, it is apt to disagree. The white Capri of Italy may be had at sixteen pence a bottle, fragrant, brisk, as if slightly aerated, subacid and altogether wholesome. Greece offers the white Mount Hymettus, which at sixteen pence a bottle may give pleasure to the experienced wine drinker by its firm, dry, clean character, and abundance of a peculiar wine flavour of a Tokay sort.

The Visanto of Greece is a sweet full flavoured wine with little alcoholic strength. Greek Santorin, at 20*d.* a bottle, is one of the stronger class of undrugged wines, and very like a light dry port. The dry white Hungarian wine called Rusate is to be had for 3-6 a bottle. The Hungarian Chablis, at 16*d.* a bottle, is a light wine of a light straw colour, not too acid, rather too much bouquet. The Hungarian Erlauro is pure and pleasant at 17*d.*; at half a crown is highly commended as an excellent claret. The Austrian red Voeslauer at 2 shillings and white Voeslauer at 2*s.* 6*d.* a bottle, are immeasurably superior to the cheap dinner sherry, for which it would be a delightful substitute.

The wines best known in India are sherries of kinds, clarets, champagne, hock; the Sicilian marsala is scarcely ever seen under that name. The Rhenish wines are often put on the tables of the more wealthy, and the Hungarian and Italian and Greek wines are rapidly gaining ground. Port, or Lisbon, are very rarely seen. In India, the famed wine of Shiraz or Kerzerum is wholly unknown, though Ahmad of Andabul sang—

> "Bring the bowl and pass it round,
> Lightly tune the sportive lay;
> Let the festal hour be crown'd,
> Ere 'tis lost like yesterday."

Wine is mentioned as having been known to Noah (Gen. ix. 20), who drank of the wine and was drunken. The allegory of the trees, in Judges ix. 13, speaks of the vine which cheereth god and man, and St. Paul (Tim. i. 23) recommends the use of a little wine for the stomach's sake. Before his time, Homer had said:

> "The weary find new strength in generous wines."

and Martial had sang,

> "Regnat nocte calix, volvuntur biblia mane,
> Cum Phœbo Bacchus dividit; imperium."

which has been rendered,

> "All night I drink, and study hard all day,
> Bacchus and Phœbus hold divided sway."

There is a most ample supply of wine over a large portion of the earth's surface.

Port, as first sent abroad, was a much lighter wine than it afterwards became; neither was it at the outset the growth of the Douro, nor even shipped at Oporto. But the Methuen Treaty, by giving Portugal an advantage over other countries amounting to 24*l.* a pipe, forced the English to take to Portuguese wine; and Portuguese wine was most easily shipped, we presume, from Oporto. Gradually more and more brandy was added, and in 1754 the agents in Portugal asserted that the English merchants knew that the best wines of the factory had become extinct. It is now a maxim with all port-growers that brandy must be added in considerable quantities; and not only is the quality much improved by the infusion, but the wine will not keep any length of time without it, and the best and strongest natural wines require the greatest amount of extraneous spirit (about 20 per cent.) to keep them in a sound and improving condition. Mr. Shaw believes that the most perfect vintage of port-wine was that of 1827, about which there was nothing peculiar, or what is called striking. The wine was evidently from well—not over—ripened grapes; and there was in it a fine firm fulness, with sufficient richness, but no hard stalkiness or dryness; so that it was certain to go on improving. This kind has also the advantage that it does not require absurdly long keeping in bottle.

Sherry grows in a very small part of Spain, and it is only in the southern districts of St. Lucar and Xeres in Seville, and at Montilla in the adjoining province of Cordova, that it is produced. Mr. Shaw mentions that about six gallons of spirits are put into a butt of sherry after fermentation, and generally about four gallons more previously to its being shipped. Sherry is pale at first. The very dark brown is made in the following manner:—Twenty or thirty gallons of must—that is, unfermented juice—are put into an earthen vessel and heated until not more than a fifth part remains, when it looks and tastes like treacle. This is turned into a cask containing more must, which causes it to ferment; and the result is a very full luscious wine, which, if originally good, becomes after many years, invaluable for giving softness, richness, and colour to others. Large quantities of this product, when new, are used to colour and to cover the harsh thinness of poor qualities, and it is for this reason that it is called the "Doctor." Hence brown sherry often forms a very considerable crust, and even very old pale, which has been racked and shipped perfectly bright and again refined in England, will be found to have numerous "fliers" which have shown themselves since bottling.

The production of real Chateau Margaux is estimated at 400 hogsheads, but about 4000 hogsheads are said to be sold under the name. The four kinds of clarets of the first growths, and the real average amount of their production, are—Chateau Lafitte, belonging to Sir Samuel Scott, and producing 560 hogsheads; Chateau Margaux, belonging to M. Aguado, and producing 400 hogsheads; Chateau Latour, belonging to MM. de Courturon and de Flers, and producing 320 hogsheads; and Chateau Haut Brion, belonging to M. Eugene Larrieu, and producing 480 hogsheads. Formerly every Bordeaux house of note that shipped claret to England added large quantities of hermitage, which gave the appearance of body, but at the same time deadened the flavour, and after a few years in bottle the wine became of a brownish hue, hard, and flavourless. Shipments are now much purer. The consumption of Bordeaux wines is greatly increasing, but then the area of the wines brought down to be shipped at Bordeaux, or to be mixed with Bordeaux wines, has been greatly extended by railways. There are three sets of names under which the wines are sold. First there are names of districts—the Medoc, St. Emilion, the Graves, and the Cotes. Almost all the first growths of wine come from the Medoc. Secondly, there are the names of parishes, as for example, Pauillac, Saint Julien, Saint Estephe. Leoville and Laroze, for example, are grown in the parish of Saint Julien. Lastly, there are the names of vineyards, such as Chateau Lafitte, Chateau Margaux. It is the last set of names alone that really give any distinctness. There is no precise meaning in calling a wine Medoc, or Saint Julien, or Saint Estephe. But these terms are used to describe wines for which a particular price, and no more, will be given. There is no difference between asking for claret at thirty shillings a dozen, and Saint Julien at thirty shillings a dozen, for any claret at that price may probably be called Saint Julien. It is only when the vineyard is good enough to give its name to a distinct wine that the name indicates, or is supposed to indicate a particular wine. If, therefore, a wine merchant offer to sell the Saint Julien wine, called Leoville, and does not supply wine from the Leoville vineyard, he does not sell what he professes to sell; but if he merely offer to sell Saint Julien generally, he simply undertakes to sell a cheap wine, for claret is no better for coming from some part of the whole parish of Saint Julien. Champagnes until lately, were made from the grapes of certain vineyards; but now all the wine of the best houses is composed of various growths mixed together. The black grapes form generally about two-thirds, giving strength and body, while the white impart richness, delicacy, and bouquet. The vintage in favourable seasons begins about the middle of September, but it is more often about the 10th October. To produce a hogshead of wine, it is calculated that from 760 to 960 lbs. of grapes are required, and it is only the produce of the three first pressings that is used for wine of a good quality. The wine is drawn off the lees into fresh casks, which are placed above ground, and it remains there un-till the month of March, when the important operation of bottling begins. If the wine has not enough natural saccharine matter to bring it up to the standard proper for effervescence, sugar-candy is added; if it has too much, the effervescence is diminished by adding old still wine. The bottles are lowered into cold, deep cellars, with a temperature of about 36° Farenheit, and yet the wine soon begins to work, and the loss by breakage of bottles is a serious item in the cost of making champagne. In the following October they are removed into another cellar to wait the purchase of the regular buyer of champagne, who deals with it in its after stages. He gets the wine in a thick state, and the first operation he subjects it to is that of placing it in a table so constructed that the mouth is inclined downwards. In a few days the deposit is found on the lower shoulder. Gradually the whole of the deposit is brought, by skilful manipulation, to the bottom of the cork. The bottle is then opened, and a certain quantity of the wine rushes out and carries away the impurity. The quantity in the bottle is reduced, in order to allow the proper amount of liqueur—that is, liquid sugar-candy—to be added. It is the addition of this liqueur—its quality, its amount, its colour, and the quantity of spirit put in it—that gives the special character to the champagne of certain firms. The champagnes intended for cold climates have generally much more liqueur added to them than those intended for hot climates. In itself, champagne is almost colourless, and consequently those kinds called amber, partridge-eye, and pink have been coloured. The colour is sometimes produced by an infusion of elderberries; but the more careful operators only admit the colour which is derived from the husks of the grapes after having been pressed, and their colour allowed to mix with the juice. Sometimes, however, a champagne, although coloured, has received its colour solely from nature, for in years of great heat the skin and the pellicule (the part by which the grape hangs) become so ripe that they give natural colour to the juice. Champagne of a first-rate vintage will continue to improve for ten years in bottle; but unless it is of such a vintage as '34, '49, '51, '58, '61, or [illegible] is best to drink it when two or three years old.—*Henderson's History of Ancient and Modern Wine. WISTARIA SINENSIS. *D. C.*

Glycine sinensis, *Sims.* | Chinese Wistaria, ENG.

This twining plant is one of the Fabaceæ and of the section Phaseoleæ In China Mr. Fortune saw the Wistaria Chinensis in a dwarfed state, growing in a pot. The tree, from the size of its stem, was evidently aged. It was about six feet high, the branches came out from the stem in a regular and symmetrical manner, and it had all the appearance of a tree in miniature. Every one of these branches was then loaded with long racemes of pendulous lilac blossoms. These hung down from the horizontal branches, and gave the whole the appearance of a floral fountain.

WITCH SWINGING. A clearly proved case of witch swinging occurred in 1871, in Oodeypore, showing that this barbarous practice still prevails among the Bheels of that wild tract in the extreme south-west of Oodeypore, in spite of the (possibly feeble) efforts of the Durbar to put it down. The headman (Gounthee) of a Bheel village was taken ill, and one Lemba bhagooree, a bhopa, or witch-finder, was employed to discover the witch who had caused his sickness. That man's account of what happened, given before the Political Assistant at Kotra, was as follows:—" Dhuna Doongri took a handful of grain, and having waved it over the body of the Gounthee Sukra, asked me to look at the grain. I looked at it, but I never spoke or said a word, nor did I show that any one was a witch. I remained perfectly silent. On this Champa, Knolo, and the four sons of Sukra said to me—Why are you silent and do not speak? We have already arranged everything; Deeta, Loi's wife, is the witch, and she has made the Gounthee ill; let us go and put her to the test. On this every one rose, went and seized Deeta, and took her to the water and put her to the water test, which is the following:—A bamboo is embedded at the bottom of any piece of water. The accused goes to the bamboo, holds it, and by it descends to the bottom. In the meantime one of the villagers discharges an arrow from his bow, and another villager runs to pick it up and bring it back to the place it was launched from. If the unfortunate woman is able to remain under water until this is done, she is declared innocent, but if she comes up to breathe before the arrow is returned to the bowman, she is a true witch, and must be swung as such. The bowman was Kumla Kasota, his father's name Nurhingh, of village Khara. The fetchers of the arrow were two of Sukra's sons, Kumla and Joyta. I was also present at the time of test. The woman failed in the test and thus became a witch. At this a great outcry was raised, and the woman was seized and tied up and taken away. I returned to my home. Other evidence, however, shewed that after looking at the grain, Lemba had declared Deeta the witch. What happened then may best be told in Deeta's own words:—Seven Bheels of Jhanjur and Kumla of another village, came to my house and told me I was a witch, and that I had made Sukra Gounthee ill. They seized me, saying, Come and undergo an ordeal. I agreed and went with them. They put me to the test of taking out a rupee from heated oil. I twice took out the rupee from the burning oil without injury to myself, and was innocent. They allowed me to go home. At the time of undergoing the ordeal my husband Deeta Loi, and his elder brother Lalla, were present on my part. A month after this the above named seven Bheels again came to my house, seized me, and said they would put me to the water test. They took me to the river and told me to perform the test. I refused, and did not enter the water; they then took me to a tamarind tree behind Sukra's house, and applied a bandage of red chillies over my eyes, tied me to a rope head downwards from the tree, and began to swing me backwards and forwards. They swung me for two whole days; the third day they swung me till 12 o'clock A. M. They, thinking me then dead, undid the ropes, and left me there. Budda Paigee, who belongs to my father's village, and whom I call brother, took me to his house and attended to my wounds and my inanimate state. Having a little life in me I recovered. The rope, it appeared, had been tied round her ancles. During the swinging the Bheels kept on shouting and urging her to confess. They used to take her down at night, but not to untie the rope; and they gave her food. Two of the neighbouring Thakoors tried to stop the swinging, but the Bheels would not obey, but at last a period was put to further torture, either by the influence of the Mewar Vakeel, or by the impression that its victim was already dead. The Political Assistant sentenced Lemba to five years' imprisonment in the Ajmere Jail. The punishment of the villagers who swung the woman had been committed by the Durbar to a neighbouring chieftain, and he executed it in such a barbarous manner as to call for severe animadversion on the part of the British Political officers. —*Pioneer.*

WITTOBA, one of [illegible] subordinate incarnations of Vis[illegible] It took place at Panderpur, a town about eighty miles to the south-east of Poona. The brahmins speak of it as an event of not very ancient date, but say that it is recorded, perhaps prophetically, in the Bhagavata. A splendid temple is there dedicated to his worship. He is represented sculptured in stone, of the size of a man, standing with his feet parallel to each other; with his hands upon his lips, the fingers pointing forwards; he is covered with a sort of raised hat, crowned with a linga: his hair is plaited, and turned up. Wittoba is also worshipped at Alundi, but his principal shrine is at Punderpoor, on the Bheema, to the westward of Sholapoor. The history of this incarnation conveys, unlike most hindoo legends, a moral lesson. The three principal gods of the hindoos are Vishnu, Siva, and Bramah, and the three goddesses Lakshmi, Durga, and Saraswati. Doorga or Durga, is often called Parvati or Parbutti, Bawan, Bowani or Bhovani, Kali, sometimes Devi, and she is spoken of under all these several denominations. Wittoba is a god of very questionable orthodoxy, but he is very popular among the Mahrattas, and, therefore, the brahmins admit him with the best grace they can into their pantheon. The same is the case with Kandoba, who is yet more popular among the lower orders of Mahrattas, and, if possible, less orthodox; they are probably the ancient deities of the Mahratta race, which the pantheistic spirit of brahmanism has admitted as hindu divinities. In Isaiah lvii. 6, where the Jews are reproved for their idolatry, stones are mentioned as one of their objects of worship. "Among the smooth stones of the stream is thy portion; *they*, they are thy lot, even to them hast thou poured out a drink offering, thou hast offered a meat-offering. Should I receive comfort in these?" Veneration for stones may be traced among all nations; the following instance from Scripture reminds one strongly of Hindu simplicity. "And Jacob rose up early in the morning, and took the stone he had put for his pillow, and set it up for a pillar, and poured oil on the top of it." (Gen. xxviii. 18)—*Chow Chow, p.* 251. *Ward's Literature and Mythology of the Hindoos. Moor, Hindoo Pantheon, p.* 416, 417.

The wolf roams over British India, never singly, but always in large or small packs. If a single one appear, it may be assumed that others of the pack are near. They are bold even in the vicinity of towns, scarcely moving off from horsemen; and in Central India, Oudh and the Panjab, they destroy large numbers of children. Their ordinary prey are deer and sheep, and in pursuit, they display great sagacity, throwing out flanking parties on surrounding the game; recently a sambar deer was seen to run close up to a railway train in Berar, but halt as the train moved on, and looking beyond, a body of wolves were observed in its pursuit. The wolves of the peninsula of India move a little to one side when pressed by a horseman, and a little exertion places them quite aloof. In the districts of the Sind'h Hyderabad collectorate, not less han 315 wolves were killed during one month of March at an expenditure of Rupees 804, 51 hyænas at Rs. 223, and 13 jackalls at Rs. 4-12. Wolves are numerous in the neighbourhood of Sultanpoor, and indeed, all along the banks of the Goomtee river, among the ravines that intersect them; and a great many children are carried off by them from towns, villages, and camps. Hardly any of the hindoo population, save those of the very lowest class who live a vagrant life and bivouac in the jungles, or in the suburbs of towns and villages, will attempt to catch or kill them. All other hindoos have a superstitious dread of destroying or even injuring them; on whose hand a drop of wolf's blood has fallen, believes himself doomed to destruction. The class of little vagrant communities above mentioned, who have no superstitious dread of destroying any living thing, eat jackalls and all kinds of reptiles, and catch all kinds of animals, either to feed upon themselves, or to sell them to those who wish to keep or hunt them.—*Tod's Rajasthan, vol.* 1, *p.* 466, *Sleeman's Journey p.* 206.

WOLFF, Reverend Joseph, a native of Germany, a Jew convert to Christianity, domiciled in England, who travelled as a missionary to the Jews through Central Asia, to Cabul, to Jeddah, and to Bokhara, in 1844 he made a noble effort to release Colonel Stoddart and Capt. Conolly.

Amongst the various races and tribes dwelling in the south and east of Asia, the position of women is as varied as the tribes and races of which they form a part. Very few girls receive any school education, and amongst the Persians, the mahomedans, and hindoos of India, they are usually married before they grow up, and are afterwards taken to their husbands' houses. The daughters of non-Arian races are married later in life. The Kandian of Ceylon, the Nair and Kamalar of Malabar, and the Tibetan races in Kanawar, are polyandric: the Kulin brahmin of Bengal is polygamic. Mahomedans can, by their law, marry four wives; they usually have but one, though if wealthy and disposed to do so, they retain others as the harm or as mutai or doolee wives, of whom Tippu Sultan is said to have had nine hundred. The Aryan and Turanian races of India, in the selection of their wives, follow very different customs: the one is exogamic, taking wives from other tribes than their own; and the other endogamic, taking them from their own tribes. With mahomedans, the selection is not restricted, but amongst mahomedans of Arab descent, a young man can claim to marry his mother's brother's daughter as his right. Except amongst the Kulin brahmins, few hindoos have more than one wife. Amongst some of the Turanian races, whose daughters grow up unmarried, a courting, as is customary in Britain and its colonies, is common; but as most of the marriages take place while girls are of tender years, or where, as with the mahomedan and the kayasth races, the women are gosha or secluded, and courting is inapplicable or impossible, the betrothal arrangements are made by the parents direct, or by means of agents called dilalah. Amongst the Kol of Central India, the marriage by capture still continues, as amongst some of the Turkoman races and amongst some in the Malayan peninsula; and young men amongst the Gond race occasionally serve for a wife. The wives of the mahomedan, Kayasth and Rajput afford no out-door aid to their husbands, but the Kumbi and Kurmi women, the Jat women, the Vellalar, Reddi, Kapalu and Okla, the shepherd, dhangar, and kurumbar women, and the women of nearly all the Turanian and non-Aryan races, engage in out-door work along with their husbands; and with some of the Turanian races in the N. W. and N. E. borders of British India, the field labour is almost entirely performed by the women. The Rajput women have always taken a large share in the management of the out-door duties of their husbands, and in their wars, to capture their foeman's wives was ever deemed the greatest proof of success. When Hector, anticipating his fall, predicts the fate which awaits Andromache, he draws a forcible picture of the misery of the Rajpoot; but, to prevent such degradation, the Rajpoot had recourse to the johur, or immolation of every female of the family. The very term widow (rand), is used amongst the populations of British India, in common parlance, as one of reproach. The rule for the Jews (Judges v. 25-30.) Deuteron. xxi. 10-13, "When thou goest forth to war against thine enemies, and the Lord thy God hath delivered them into thine hand, and thou hast taken them captive and seest among the captives a beautiful woman, and hast a desire unto her, that thou wouldest have her to thy wife; then thou shalt bring her home to thine house, and she shall shave her head, and pare her nails; and she shall put the raiment of her captivity from off her, and shall remain in thine house, and bewail her father and her mother a full month: and after that thou shalt go in unto her, and be her husband, and she shall be thy wife."

To a German mind, says Tacitus, the idea of a woman led into captivity was insupportable, and to prevent this the Rajpoot raises the poignard against the heart which beats only for him, though never to survive the dire necessity. It is then they perform the sacrifice johura, when every sachæ (branch) is cut off, and hence the Rajpoot glories in the title of Sacha-band, from having performed the awful sacha rite, which has every appearance of being the sacæa of the Scythic Gete, as described by Strabo.

We learn from the book of Esther that amongst the early Persians, the intercourse between women and men was much less circumscribed than after the spread of mahomedanism. Ladies were even admitted to banquets and received strangers in their own apartments, whilst they resided habitually in a kind of harem, separate from the dwellings of the men. At the [illegible], in countries where mahommedan [illegible] prevail, and now including India, the women in the streets have a much meaner appearance than the men, because women of the better class are so little seen. But in buddhist Burmah all the young move about unrestrainedly dressed in their gayest and best, and the women engage largely in trade. Amongst the hindus before the Christian era the king's person, when within the palace, used to be attended by women, his guards and other troops being stationed without the gates. Thus, Strabo says, Regis corpus mulieres curant, ea quoque de parentibus emptæ, qui regem custodient, et reliquis exercitus manent extra portas (IV. 15. p, 228); and, in Hyderabad in the Dekhan, the noble families still retain armed women as guards of their households.

The Bible shows progress in the Jewish views as to women. At the outset, the right of woman to choose her lot seems to have been wholly disregarded, as Abraham twice permitted Pharoah to have Sara, Judah condemned his daughter-in-law to be burned, and God threatened to give David's wives to his neighbour or to his son: Michal was transferred to Phatti from David by Saul, who had quarrelled with David, and kings habitually succeeded to their predecessors' wives. The social position of Indian women, even amongst the Aryan hindoos and mahomedans of Arabia, Arya and Moghul descent, is now, A. D. 1872, greatly improving.

Hindu poets very rarely dispraise women; they almost invariably represent them as amiable and affectionate. In this they might give a lesson to the bards of more lofty nations, and particularly to the Greeks, who both in tragedy and comedy pursued the fair sex with implacable rancour. Aristophanes is not a whit behind Euripides, although he ridicules the tragedian for his ungallant propensities.

In the Sanscrit and English dramas, the passion of Malati is equally intense with that of Juliet; but her unconquerable reserve, even to the extent of denying her utterance to him she loves more than life, is a curious picture of the restraint to which the manners of hindu women were subjected even whilst they were in enjoyment, as appears from the drama of considerable personal freedom. Megasthenes tells us that the Indians of his time did not communicate their metaphysical doctrines to women, thinking that if their wives understood their doctrines and learned to be indifferent to pleasure and pain, and to consider life and death as the same, they would no longer continue to be the slaves of others. We find from the later ceremonial sutra (Srauta and Grihya sutra) that women were not allowed to learn the sacred songs of the vedas, the knowledge of which constituted one of the principal acquirements of a brahmin before he was admitted to the performance of the sacrifices. Manu ix and 18 says, women have no business with the text of the vedas, thus is the law fully settled; having therefore no evidence of law, and no knowledge of expiatory texts, sinful women must be as foul as falsehood itself, and this is a fixed rule. The practice of the wife worshipping the husband is very ancient. In the drama styled Ratna-vali or the necklace, Vasava-datta, after worshipping the image of the deity, her attendant says,

The worship of the divinity concluded, be pleased madam to pay adoration to your lord.

Vasava. Where are the flowers and unguent?

Kanch. Here madame.

On which Vasava-datta worships the king. This is conformable to the Bhavishyottara Purana, which directs, "Having offered adoration to the mind-born divinity, let the wife worship her husband, with ornaments, flowers, and raiment. Thinking internally with entire complacency, 'this is the god of love.'

The wives of the poorer classes of hindu householders rise at three in the morning frequently to grind grain, and are occupied, perhaps for three hours, in preparing as much flour as will last until the third day. When they have no grain to grind they must still rise at the same early hour, to milk the cows, churn, and extract clarified butter. At six o'clock, after arranging their costume, they set off with their vessels to the well or to the river side, where they bathe and fill water, then return home. Some women bathe at home and fetch water afterwards, and rich men's wives have a servant, especially for attendance on the bath. When the women return with their water vessels filled they must prepare breakfast. The men and boys of the family, when breakfast is ready, sit down in a line at short intervals and eat; when they rise, the women sit down. Breakfast finished, and the men off to their various duties, the women are busily employed in cleaning the house, the fireplace, the plates and dishes and other vessels, and in preparing grain for grinding. About three in the afternoon they have a little leisure, which they employ in attending to their children, or in combing out their own long hair, and oiling it. In the evening they are again busy getting ready lights, preparing dinner, and spreading the beds.

To a careless observer, hindu life seems altogether stagnant and uninteresting. And yet, although shut out by his social laws from much that to Europeans is of the deepest and most tender concern, the hindu existence has a romance of its own—often indeed of a baneful and lurid tinge, but still romance. It is not in the crowded bazaar, for there all is change. We must wander to a remote sequestered village, where, under the shade of his ancestral trees, we may find the hindu living the life of tradition. He is, in many aspects, the man of a thousand years ago. Clinging to immemorial usage, the rural hindu begins and ends his life much as his ancestors of legendary days were wont to do. The wondrous fascination of antiquity is not on the wane; much of the ceremonial has indeed worn away, but the spirit is vital still. There is a strange and sharp contrast between the theories of hindu and mahomedan life. By the latter, existence on earth is valued mainly as a field and opportunity for action; with the hindu, human interest is confined almost entirely to the beginning and the end; on the life-struggle of the developed man he sets but little store. His creed tells him that during the maturer years Fate is at the helm; but it also comforts him with the assurance that at the dawn and sunset of life human efforts are permitted to have an influence for weal or woe. On the twelfth day after birth, the hindu child is presented to the pundit, who, with solemn fervour, pours out the libation of crimsoned water to the rising sun. This accomplished, the women of the household, placing the happy mother with the child in her arms in their midst, gather round her and sing songs of rejoicing. A feast of the brethren closes the ceremonies. Two years pass away. In the third year the nai or barber of the household enters on the scene. The hair of the child has to be arranged according to the usage of his caste; his ears have to be pierced and the rings inserted. These rites duly performed before the assembled village, the happy parents feel hopeful of the future of their boy. From this time up to his tenth year the child is left much to himself. In the cold weather and the early spring he joins the village youth in their sports. In the rainy season, confined much in-doors, he often sits and listens with absorbing interest to the stories which have been transmitted from generation to generation, and learns to join in the song of thanksgiving for the plenteous downpour. When at length the tenth year arrives, it is incumbent on the father to instruct his child in the rudiments of his craft. If a kayasth, he is initiated into clerkly lore, and learns to hold the pen and cipher. If a tiller of the soil, he is taught to lay the seed with care, to tend the yoked oxen, and to watch his father at the plough. If a Kshatriya, he must endue his body with manly strength by constant exercise, wrestle, and learn the use of weapons —the ancient dhanur-vidya—and fill his mind with high and martial thoughts. When the time comes for his marriage, he has no part in the negociations, and is bound by the decision of his parents in concert with the brahman and nai. But not seldom does the mother, with anxious solicitude, venture forth disguised into the distant village, and in secret judge for herself of the bride elect, that her son may at least be wedded to a worthy partner. The marriage over, by the twelfth year the boy is sent to his guru. To do good actions, worship aright his dewta to restrain his breath, to reverence his guru, are instilled into his heart as the main virtues to be cultivated. The fifteenth year arrived, the lad must be doing for himself, and his father sends him forth with a blessing and a prayer—his offering to a Fate which he hopes to have propitiated. The youth's after-life is often a chequered one. Toiling, rejoicing, sorrowing, he spends his days where his lot has cast him. When at length old age finds him feeble and a burden on his children,—though a burden cheerfully borne by them,—he bethinks himself of his end. And strange indeed are his visions; for to the devout hindoo the death-bed and closing moments of life possess a deep and terrible interest, knowing that the heaven of Vaikantha is reserved for those only who have cared not for the glamours of the world. From the day of the death of her husband commence the widow's sufferings and privations. She is made to employ herself in the performance of devotional austerities which know no end. Constant fasting and bathing, abstaining from the use of certain articles of food, and going round the tulsi shrub, venerated by the hindus, or some idol in a temple, are the mortifications she is to inflict upon herself. At the celebration of certain joyous occasions which so frequently engage the attention and occupy the time of the wife of a living husband, she is not a guest, for her appearance on all such occasions is considered to be a bad omen. It is the pride of the wife, and she thinks it her peculiar privilege, to attend on all such occasions when invited; but the widow loses this of all the privileges most dear to her by the death of her husband. Even at the marriage ceremony of her brothers or sisters she cannot, consistently with the superstition prevailing among the hindus, take a lead or join other females who, because their husbands are living, can enjoy all the reasonable freedom and pleasures of life. The hindus invariably consider it an auspicious omen to come across the wife of a living husband when they leave home for the accomplishment of their intended purpose; but if they happen to come across a widow, they despair of success in the design, and proceed with reluctance or return back to curse the widow. Hence hindu widows systematically hold themselves aloof on all occasions and at all times. Even dear parents and brethren would not allow the widowed daughter or sister to come across or stand in the way when they are going out on purpose. This degrading superstition of the hindus is a source of unspeakable sorrow to the suffering widow. Unlike the wife of a living husband, the girl-widow is abstinent and reserved. She cannot familiarly talk with her dearest and nearest relatives. Her every word and movement are subject to uncharitable construction. Among the brahmins her diet is rigidly regulated. She is welcome to a meal only once a day; and she must content herself with some unwholesome eatables in the evening, merely to subdue the cravings of hunger. She must devote her life exclusively to religious and melancholy contemplation, and spend her days, if convenient, in pilgrimages to some holy shrines. She is considered as a being wholly unfit for any of the duties of her life. A girl who is widowed at a tender age and knew not what conjugal happiness is, is not subjected to the humiliations above described immediately after the death of her husband. Until she arrive at the age of maturity she is shown some regard by her parents and relatives. Her natural ornament, the hair, is allowed to remain until that time. She is not prevented from wearing her usual ornaments and apparel. This state of the girl in her early widowhood is treated with some indulgence even by the brahmins. Among the Guzerati people whose creed and habits of living differ but very little from those of the Marathi hindu, widows even at a tender age are not prohibited from frequenting the temples and the mandir of maharajahs—the incarnate gods. They are, on the contrary, encouraged and advised, as the sure means of salvation, to go to the mandir and worship and prostrate before the man-god whose known character has secured a lasting place for that class of men in the annals of India. The practice of frequenting the temples is not so extensively prevalent among the Marathi hindus, though females, especially young widows among them, are not wanting who go daily as a rule to temples to hear the puran or kirtun of the hindu preacher. It is patent to all that the purani are anything but moral men. Their line of life has a two-fold object, to make money and to seduce young women. Files of vernacular prints furnish in abundance examples of young widows having been led into inextricable labyrinths of guilt and misery by the hindu purani and preachers. The prohibition of widow re-marriage entails upon the widow and her relatives an amount of misery and disgrace of which no description can convey an adequate idea to a foreign reader. Even a highly educated man who is void of moral principles is not seldom found beguiled in the temptations of this world. A woman, whether educated or otherwise, when widowed in the very flower of youth, however respectable her parentage, or whatever the high position and fame of her deceased lord, cannot, in the very nature of humanity, desire to live and die a widow. She ardently wishes, though not apparently for fear of incurring the supposed disgrace attached to widow re-marriage, that she herself and others like her could be permitted to marry another husband. Such a widow, in the very prime of life, however vigilantly watched and rigorously engaged in the performance of austere duties, cannot stand proof against that temptation which is most difficult to conquer. Whether in the superior or middle classes of the hindus, where the re-marriage of a widow is prohibited, the amount of sin is incredible. Where the widow is not dead to all sense of shame, she carries on intrigues in a way to elude notice, and it is not seldom that such an intercourse has proved eventually detrimental to her life. Intercourse, whether legitimate or illicit, must some time or other bring home to the mother a child. When the widow is thus situated, she tries all the means in her power and in that of her lover to conceal the fact from the world; but when these prove unsuccessful, she must pay for it the penalty of death, either by recourse to suicide or by an attempt to destroy the child in the womb. Elopements and seductions of various shades, sickening to describe, are the result of the prohibition of the widow's remarriage. Parents are known to have killed themselves by poison and drowning in consequence of the disgrace brought upon them by the conduct of their widowed daughters. Infanticide among the hindus other than the Rajpoots may be traced to this cause.

Besides the custom of baby-marriage as the source of early widowhood, there has been another practice among the hindus which brings untimely widowhood to the poor wife. An old widower, with one foot in the grave, especially among the brahmin and the banya races, is wedded to a girl of a tender age. In such a case the parents of the girl are actuated by mercenary motives in disposing of their child to an old man who, infatuated by an impotent love or by a strong desire to beget an heir to his property, grudges no amount of money, however large, for the purchase of the girl. The girl may be said to be widowed from the moment of her union with that man. The pitiable disparity of age between the sexes naturally causes discontent in the bride, who may not improperly take the hoary husband for her great-grandfather. Facts are known of such unions having ultimately proved the ruin and disgrace of both the families. To part with a daughter for gold to an old man whose days are numbered is to purchase for the value of that article eternal widowhood.

with its concomitant evils, for one's child. Such a transaction of sale and purchase is a species of infanticide which is unhappily not cognizable by law. Amongst the hindoo races, the married girl, after the departure of her husband from this world, lives generally with her parents or brethren, if they be able enough to pay for her maintenance. Here, too, her life is a life of misery. The once affectionate and loving parents grow gradually indifferent and lukewarm in their affections. There are some who deeply feel for the condition of their daughters, and who would endeavour at any cost to make the object of their solicitude and tender care happy. But the tyrant custom of the prohibition of the widow re-marriage is an insuperable bar in their way. They have not the moral courage to break through the bondage of caste-system to re-settle their dear child by wedding her to a worthy man not belonging to their caste. Thus, when the widow is destined to drag her single existence under her parent's roof, she becomes by lapse of time an object of less kindness and affection even on the part of her parents. The household concerns, not excluding the duties of a menial, fall to her share. She must act as a cook and as a maid of all work. Her sisters-in-law, if her brothers be living, not unfrequently treat her with unkindness, and regard her with a jealous eye, if she happen to be in the good graces of her parents. If everything be kindness and love on the part of her parents, she feels nevertheless a kind of dependent and uneasy existence. But if she live with the parents of her deceased husband, she is treated as a creature who is little better than a beast. If the bereaved parents be kind and affectionate, they show some regard to her wants and comforts. But such good parents-in-law are few and far between. The hindu law of inheritance is not more indulgent to the widow. After the demise of the husband, she is not entitled to any thing more than bare maintenance and a little money for holy purposes.

Those who lose their husbands in an advanced age, and are blessed with a son or sons, are better situated in comparison. They are not exposed to such sufferings and privations as usually fall to the lot of the widow girl. The son, if kind and educated, gives every comfort in his power to his mother, and makes her happy for the rest of her days; but if he be cruel and ignorant, her fate is sad indeed.

In the absence of a son, she lives with her daughter and son-in-law, who, if they be kind and well-disposed, do not grudge her protection. The condition of a hindu female when left to her own resources after the death of her husband is very hard. Unlike her sisters in the west, she has not obtained that education in India which enables the European lady to live independent of others. Her European sister can act as a schoolmistress; a literary contributor; a teacher of music, of painting and drawing, and by knitting, &c. Knowledge and practice of these well nigh independent professions furnish the lady with ample means to support herself and a small family. Such is not the case of hindu females, and consequently a poor hindoo widow has no other alternative than to submit with Christian resignation to the drudgery of cookery, or grinding, or to some other menial life.

To be brief, the widow lives a life of toil and mortifications. Domestic drudgery is her inseparable doom. If she be able to read, she may spend a leisure which is short and hard-earned in the perusal of a pothee, or book, containing absurd tales in honour of some hindu gods or imaginary deities. Not knowing anything beyond the knowledge of an alphabet, and brought up in a religion and among the people devoted to the worship of stones and beasts, she cannot possibly soar to the truth of one eternal God to the exclusion of others, and cannot have those consolations which women enjoy, who believe in a future existence.

Some portions of the christian scriptures can be explained by the existing customs of the women of India. It is mentioned that two women shall be grinding at the mill, and two women almost always sit at the common hand-mill. Paul in his first epistle to the Corinthians xi. 6, says, if it be a shame for a woman to be shorn or shaven, let her be converted. And hindoo women cut off their hair at the death of their husbands, as a token of widowhood. A married woman's hair is considered an essential ornament, nevertheless thousands of young women approach the pagoda at Tripaty with beautiful hair, and there shave it off as an offering. The phrase good man of the house,—a hindoo or mahomedan woman never calls her husband by his name, but frequently speaks of him as the 'man of the house.' John iv. 27 relates how the people marvelled that he talked with the woman, and the Persian Testament has it, 'with a woman:' and perhaps this is nearer the design of the sacred writer; for in Eastern countries, except among the lower orders, a man is never seen talking in the street with a woman; it would be a great scandal to both parties.—*Pennant's Hindustan, v. i. p. 56. Every flowering plant is composed of an axis, and the appendages of the axis; the former consisting of the stem and root, the latter of the leaves and flowers. The term wood is applied to those portions of the vegetable axis that are sufficiently hard to offer considerable resistance and solidity, so as to be used for purposes requiring various degrees of firmness and strength. In trees, shrubs, and undershrubs, the axis is said to be woody; in herbs it is termed herbaceous. In the former, stems are permanent, and do not die to the ground annually, as is the habit of the latter. A shrub, a tree, an undershrub, a bush, are merely gradations of magnitude in perennial plants; woods valuable for purposes of art and manufacture are derived from all of them. But as bulk and dimensions are necessary to make timber available for extensive use, by far the greater part of the ornamental woods are derived from trees. It seldom happens that the core of trees is exactly in the centre; they seem in Europe to thicken most rapidly in the direction in which they are most exposed to light and heat. Scotch firs thus exposed, measure twice as much in this direction as in the opposite. A healthy casuarina will attain an altitude of 50 feet, and a circumference, above the ground, of 30 inches. At the base, the section has the form of that of a pear cut lengthways, the larger diameter being 10 inches, the shorter 7. Measured across the core, we find the one radius 9½ inches, the other 3½, or nearly double that of the Scottish fir. In a tree of the same age 45 feet in length, two feet in girth, the greater diameter was 8 inches, the lesser 6—the larger radius being 5 inches, the lesser 3. Taking the tree in lengths of ten feet from the root, the seven rings continue to the last, the innermost having extended themselves upwards to the very top as the tree grew. But the eccentricity of the core has now greatly diminished, and the stem becomes nearly round—the predominance of the mass continuing on the same side as at the root. These peculiarities are most conspicuous in the casuarina; but they manifest themselves more or less in all trees. An India rubber tree planted in 1851, attained a diameter of 7 inches, the core being 4½ inches from the one side, and 2½ from the other; the two grew side by side. Very nearly the same law holds good with a teak and an acacia. In Europe the thickening is always on the south side of the tree: in India, so far as it appears, it is in general mostly due west In all likelihood the excess of solar heat furnishes the explanation in both cases. North of the tropics the sun always shines more or less from the south, and gives out more heat from this than from any other direction. From the tropics to the line, the sun is so nearly vertical, that the mass of heat contributed to a tree or any other body perpendicular to the earth, is from east or west. But from dawn till noon the temperature of the sun is comparatively moderate—it is from mid-day till sunset, that the vast mass of heat is thrown off, the rays shooting from the westward. In this direction a tree thickens on the same principle that it expands in Europe to the southward. These researches will help to assist us to that marvel of vegetable life—the silicification or petrifaction of the living trees. Every one is familiar with the spongy stony substance called tabashir deposited at the joints of the bamboo. The fact is generally known that the teak tree often becomes in part petrified,—that is, the deposition of silica becomes so abundant, as to turn a portion of the trunk into stone, usually resembling the petrified wood of Egypt, Sind, Guzerat, Burmah and Trevicary, &c. In Upper India this is not at all confined to the bamboo or the teak—both remarkable for their siliceous secretions, forming in the former a beautiful enamel all over the stem, furnishing the sharp points of the leaves, and making the upper surface of the leaves of the latter eminently serviceable as sand-paper. The Ghunbhar wood found in the Nepal and Chittagong forests contains such quantities of silica that the carpenter who contracts to saw it by the foot, makes it a condition in his bargain—that it shall contain no stone. The ebony, the tamarind, the sissoo, and the sitsal or jungle rose-wood, contain these secretions, though in much smaller quantities. The most mysterious circumstance connected with the specimens from the petrified forests is that for every atom of carbon or other organic matter that has been removed, an atom of silica has come in its room, the structure remaining so perfect that under the glass it could not be discovered whether it was a petrified or living specimen under inspection.

In Europe, the durability of wood—that is, their capacity of remaining uninjured through long lapses of time,—has been found proportioned to the weight of charcoal yielded by them; there are many woods, heavy of themselves, that leave but a small proportional residuum in the retort after destructive distillation. We doubt if any where in Europe a piece of timber can be produced known to have endured 800 years: yet the fragments of teak which have formed the supports of the ceiling of the caves of Salsette, must have been in their places for above two thousand years, and are therefore the oldest pieces of timber known to man.

The most important application of wood, is in the building and repairing of houses and ships, and in the construction of machinery. For this purpose, the large trees, which come under the denomination of *timber*, are chiefly employed. The conservation of growing timber is an art of considerable importance, and inattention to this duty has allowed nearly every forest in India to be denuded of its principal trees.

In India and in all Asiatic countries, wood and timber are not only applied to those economic uses with which all are familiar, but they also furnish fuel to all classes, supplying the place of coal. Besides this, the influence of trees on climate is very considerable, tending as they do, to prevent the too rapid withdrawal of moisture from the soil, a point of great importance in a country where the heat of the sun is intense, and the supply of water is dependent only upon periodical falls of rain. It is impossible to ascertain the amount of timber used in India, but the quantity of firewood alone imported by sea into Madras during 5 years is given below, that for 1849-50 being estimated by the Military Board to be equal to 12,000 tons.

Years.	Billets.	Value, Rs.
1845-46	63,61,816	32,536
1846-47	42,77,013	22,746
1847-48	56,78,794	31,974
1848-49	104,75,590	58,026
1849-50	98,51,050	66,101

The above is exclusive of imports by Cochrane's Canal, and the trunk roads, which the Military Board estimated at upwards of 85,000 tons per annum. The trade reports of the Madras Presidency show that the exports of the following five woods alone, amounted in value to 3,84,000 rupees in 1854, viz:—

Sandalwood, cwt.	11,684	137,944
Redwood ,,	47,431	59,570
Sappan wood ,,	5,248	15,350
Ebony wood, cwt.		4,859
Teak, ,,		216,368

The imports of timber into Great Britain alone, in 1850, amounted to ten millions of cubic feet, or 1,749,300 loads or tons.

In *Lamentations* v. 4 it is said our wood is sold unto us; but the poor hindoo, living in the country, never purchases wood for fuel; and when such a person removes to a large town, he speaks of it as a great hardship that he is obliged to buy his very firewood.—*Bombay Standard. Tomlinson.*

WOOD, Lieut. I. N. Author of a Report on the river Indus in Bl. As. Trans. 1841, vol x.—Notes on the lower part of the Indus and of the craft thereon, in Bom. Geo. Trans. 1836-1838; reprint, vol. i. 89.—Journey into the Naga hills, Ibid, 1844, vol. xiii. 17.—Journey to the Oxus, Lond. 1841, 1 vol. 8vo. —Journal of a visit to the Laccadive Archipelago in Lond. Geo. Trans. 1836, vol. vi. 29.—*Dr. Buist.*

WOOD, Sir Charles, created Lord Halifax, for several years during the changes succeeding the Indian mutiny of 1857, the minister for India. His chief work was to amalgamate the Indian with the British army, and his plans needed many changes. His friends claimed for him credit for restoring the Indian finances, but in this he had no share.—*Howell-Thurlow, p.* 22.

WOOD ALOES.

Ak-yun Burm. | Agallocha wood Eng.

The aloes wood or eagle wood of the Old Testament. See Aloes-wood, Eagle wood.

WOOD-APPLE TREE. Feronia elephantum, *Cor.*

WOOD-APPLE GUM, obtained from the Feronia elephantum, is very abundant, and forms the well known "East India Gum Arabic." Mr. Rohde mentions that from its ready solubility without residue, it gives the best mucilage for making black ink.—*M. E. J. R.*

WOOD-ASHES.

Tsau-hwui, Chin. | Rakh, Hind.

Used as a detergent remedy in disorders of the skin and hair.

WOOD-CARVING. See Carving.

WOOD CHARCOAL. See Charcoal.

WOOD COAL. See Coal.

WOODDU. Mal. Phaseolus max.

WOODDULU. Tel. Phaseolus mungo.

WOOD ENGRAVING. The following Madras woods have been found suitable, viz:—

Guava, Psidium pyriferum; the best.

Palay, Tam. Mimusops hexandra, a good wood, but liable to be attacked by insects.

Vepalley, Tam. Wrightea antidysenterica.

A fine close-grained wood, not quite so hard as the guava, but improving with age.

Jujube or Ber fruit tree, Zizyphus jujuba; rather soft.

Wood apple tree, Feronia elephantum, too coarse in the grain.

Satin wood, Swietenia chloroxylon, a close grained wood, but apt to split.—*Dr. Hunter.*

WOOD, FOSSIL. Fossil wood is in large quantity in Burmah, in Sind, and at Verdachellum and Ootatoor west of Pondicherry.

WOODIAH WOOD. ANGLO-TEL. Odina pinnata.

WOOD-MOTH. Wood-carrying moth.

Sack-trager,	GER.	Kuudi Puchi,	TAM.
Muluka Rasari,	TAM.	Dalme-Kattea,	SINGH.

The larvæ of this singular moth construct for themselves cases, which they suspend to a branch frequently of the pomegranate, surrounding them with the stems of leaves and thorns, or pieces of twigs bound together by threads, till the whole presents the appearance of a bundle of rods about 1½ inch long. The male at the close of the pupal rest, escapes from one end of this covering; but the female makes it her dwelling for life, moving about with it at pleasure, and when alarmed, draws together the purse-like aperture at the open end. There are five ascertained species of these in Ceylon Psyche Doubledaii, *Westw.*, Metisa plana, *Walker*, Eumeta Cramerii, *Westw*, E. Templetonii, *Westw.*; and Cryptothelea consorta, *Temp.* The Singhalese regard them as human beings, who as a punishment for stealing wood in some former stage of existence, have been condemned to undergo a metempsychosis under the form of these insects.—*Sir J. E. Tennant's Ceylon, p.* 432.

WOOD OIL.

Telia Gurijun,	HIND.	Siu-yu,	CHIN.
T'ung-tsze-yu,	CHIN.	Peh-t'ung-yu,	,,
		Hung-t'ung-yu,	,,

Wood oil is the term applied to the oils of several species of Dipterocarpus, D. lævis, D. turbinatus. This class of oils is obtained for the most part in Assam, Arakan, Burmah, and the Straits: they are usually procured by tapping certain trees of the order Dipterocarpeæ, and applying heat to the incision. The oil which flows from the wound is a mixture of a balsam and volatile oil, and when applied as a varnish to wood or other substance, the oil evaporating deposits a hard and durable coat of resin. They are chiefly used as natural varnishes, either alone, or in combination with coloured pigments, also as a substitute for tar in paying the seams of shipping, and for preserving timber from the attacks of white ants. They are said also to be useful as an ingredient in lithographic inks. The oils generally receive the names of the localities from which they are imported. Some of them differ considerably in colour and consistence, but they all possess the same balsamic odour, and are derived from various species of the noble family of Dipterocarpeæ. At the Madras Exhibition of 1855, were three good samples of wood oil from Canara: also a very interesting series of ten oils from various parts of the Madras Presidency and Burmah, where the mode of extraction is as follows:—about the end of the dry season, that is in March or April, several deep incisions are made with an axe into the heart of the wood, and a good sized piece scooped out; into the hole fire is placed, and kept burning until the oil begins to run, when it is received into a bamboo, and allowed to run slowly drop by drop. In Malacca, also, it is obtained from a large tree of the Dipterocarpeæ, which is very common in the dense jungles of the Malayan peninsula, and grows to a great height. When not tapped too soon, the base of the trunk is often of immense girth. The wood is reddish brown, and has a smell not unlike that of English fir, the bark is smooth, the leaves alternate, pinnate and exstipulate, fruit a one-seeded drupe, seed angular and anatropal. The oil when permitted to remain at rest divides itself into two layers, the upper consisting of a clear chesnut colored liquid balsam, and the lower being in appearance like flakes of granulated sugar, and consisting probably of the surplus resin deposited by the action of the atmosphere. The wood oil, called Gurjun balsam or Telia Gurjun, as found in the bazars, generally occurs as a brown oily-looking, semi-transparent liquid, in odour strongly resembling a mixture of balsam of copaiba with a small portion of naphtha. One kind is yielded by the Dipterocarpus lævis, a native of Chittagong, Pegu, Assam, &c. It has been successfully used as a substitute for balsam copaiba, to which it bears a great resemblance in its physical and chemical properties. Gurjun oil is, however, the product of several species of Dipterocarpus, and known generally as wood oil. Gurjun balsam contains fixed resin, essential oil, and water. If the latter be not separated, it boils with explosive violence. The separation is effected by the dried muriate of lime. A small portion of the essential oil may be obtained by distillation with water in the common way. Gurjun oil is a good substitute for copaiba balsam in the treatment of gonorrhœa, given diffused through almond mixture or gum water. Dose ten to fifteen minims, repeated thrice daily, or as often as necessary. A compound tincture of Gurjun is an efficient substitute for Frank's well known specific for the treatment of gonorrhœa. Dose, twenty to thirty minims, in a little milk or sugared water. Captain Halsted gave an account of his visit to the island of Cheduba, where the wood oil tree is the most conspicuous in growth and size of the larger trees of these summits. One was felled on the west hill which measured in diameter, at the respective ends of a 60 feet length, 24 feet 6 inches, and 3 feet 6 inches; and another on the summit measured 21 feet 4 inches in girth at 6 feet from the ground. In felling the above mentioned tree the oil ran in a stream from it, and it must have contained seven tons.

Wood oil of Chittagong much resembles the "Teak wood oil," the wood oil from Pegu, but is less liquid than the latter, though used for the same purpose. It is a very clear and liquid substance, forming a natural varnish when applied to wood or other substances.

Rangoon wood oil has the usual resinous smell of this class of oils.

One of the wood oils merits notice as being one of the substances of which the well-known and much prized China lacquer is made.

Wood oil is used in Singapore for painting the beams and wood-work of native houses, and may also be mixed with paint when not exposed to the sun.

In China the cold drawn wood oil, Peh-t'ung-yu, is pale and is used for lamps and for varnishing furniture and the better class of umbrellas. A darker thick oil called Siu-yu, is obtained by heat and pressure from the seeds and fruits of the Elæococcus and Jatropha. It is used in making putty and in caulking and painting ships and boats. There is a reddish kind called Hung-t'ung-yu. The best wood oil of China comes to Han-kuow from Shin-chau-foo.

Sissoo-wood oil from Dalbergia sissoo is an empyreumatic medicinal product.

Camphor-wood oil, from the Dryobalanops camphora, belongs to the class of volatile oils. It is used largely in Singapore as a substitute for turpentine, and sells at from 15 to 20 cents a bottle.

Deodar or Shemanatahu oil, from the Erythroxylon areolatum, is an empyreumatic medicinal oil.

A wood oil in Tinnevelly, is an empyreumatic product similar to tar, chiefly used medicinally by native practitioners.

Teak wood oil is a dull ash-colored oil procurable in most of the large bazars of India; when allowed to rest for some time it separates into two layers, the one an upper dark colored clear stratum and a lower and more solid deposit. Its chief use is for applying to wood work of all sorts, either alone as a natural varnish or in combination with certain resins.

M. Guibourt observes of the Gurjun oil or balsam, that Mr. Lowe had found that the filtered balsam formed a brown transparent liquid, which yielded by distillation as follows in 100 parts—Essential oil 65, Hard resin, 34, Acetic acid water 1. According to Mr. Lowe, the volatile oil possesses all the characters of that of copaiba, and the hard resin, (which he regards as pure copavic acid, exempt from the soft resin, which, according to him, exists in the greater part of the copaiba of commerce) appears to him indicative of superiority as a medicine. Mr. Lowe recognized in the new resinous balsam the singular property of becoming solid when exposed in a closed vessel to a temperature of 230° F. Copaiba presents no similar phenomenon.

The new balsam distilled with the addition of a small quantity of an oxidizing agent, as chlorine, hypo-chlorite of lime or bichromate of potash, yields an essential oil of a fine blue, whilst ordinary copaiba, containing soft resin, affords hardly any colored essential oil; and cold sulphuric acid produces with copaiba a purple coloration similar to that obtained with cod-liver oil.

To obtain the oil, a large incision is made in the trunk of the Dipterocarpus turbinatus tree at about 30 inches from the ground, on which a fire is lighted and kept up until the incision is charred: soon after this, the liquid begins to flow. It is conducted by a little trough into a vessel placed to receive it. The average produce of one of the better trees in a single season is 30 gallons. Wood oil is also produced from Dipterocarpus incanus, D. alatus, and D. costatus. The first of these three is reputed to yield the best sort, and in the greatest quantity.

Wood oil from Moulmein, when filtered, is a transparent liquid, of a somewhat dark brown when seen by transmitted light, but appearing opaque and of an obscure green if viewed by reflected light. It possesses, therefore, in a very marked degree, the dichroism observable in all resin-oils obtained by the action of fire. This character determines the nature of wood oil, and shows that it is not simply a natural product like copaiba; but that it is in part the result of a liquid modification of the Dipterocarpus resin, effected by the agency of heat. Moulmein wood oil is of somewhat greater consistence than olive oil; it has a sp. gr. of ·964, and possesses an odor and taste very analogous to those of copaiba. It dissolves in twice its weight of absolute alcohol, with the exception of a minute residue which is deposited upon repose.

The most curious property of the Dipterocarpus wood-oil, is that of solidifying when heated in a closed vial to 266° F.; at this temperature the oil becomes turbid and so gelatinous, that it is not displaced upon the inversion of the phial. After cooling, the solidification is yet more perfect; but a gentle warmth, assisted by slight agitation, restores its former liquidity. The resin of Vateria Indica is insoluble in alcohol, and very imperfectly so in ether; whilst the green resin of wood oil is easily soluble in either of these menstrua.—*Pharmaceutical Journal and Transactions. „ rubropygialis, *Malls.* Malabar.

The Sind wood-pecker (Picus Scindeanus) is distinguished from the other pied species by having the sides of the body dirty-white, and a broad streak of black down the side of the neck from the base of the lower mandible. The pied wood-pecker is P. himalayanus. The Mahratta wood-pecker (P. mahrattensis) also is not uncommon; the beautiful green wood-pecker (Picus squamatus) is seen in the depths of solitudes of the N.W. Himalaya, creeping up the trunks of ancient pines, or flying wildly across the valleys, uttering its loud scream as it alights on the side of a tree.–*Adam, Horsfield, Jerdon,*

The table-land of the peninsula, commencing with the Neilgherries, and proceeding along Mysore to the Deccan, Candeish, and Guzerat, presents large tracts of country affording a favourable climate, and abundant pastures for numerous flocks of sheep. If from thence we proceed in a north-east direction, passing Marwar, Malwa, Rajpootana, to the district of Hurriana, and the province of Delhi, we shall see, supported on the natural pastures of the country, immense herds of cattle, and numerous flocks of sheep, the latter affording wool employed by the natives for making blankets (Kumlee) of different degrees of fineness, which form a considerable article of the commerce of these provinces. Again, the Himalaya mountains, on their southern face, present a European like climate, remarkable however for being influenced by the periodical rains. The temperature varies according to the elevation; but they afford everywhere rich pastures, and support a fine breed of sheep, of which the wool is employed by the mountaineers to form their clothing. The northern face of these mountains is as remarkable for its dryness as the southern is for its moisture; the cold is excessive, and the animals which are pastured there are covered with shaggy hair, or with long wool, and a fine down. It is here that the shawl wool goat finds its most congenial climate. Mr. Moorcroft, who was deputed in 1814 to that part of Little Tibet in Chinese Tartary where the shawl goat is pastured, for the purpose of opening to Great Britain the means of obtaining the materials of the finest woollen fabric, found that the Hoonea were obliged to send all their best wool to Cashmere. He mentions that this was caused by strict injunctions to all the owners of flocks not to sell any shawl-wool except to the Cashmerians or their agents, in consequence of a representation having been made that the Jouaree merchants had bought some and that the Cashmerians would suffer if any of this kind of wool were to pass into other hands.

In the year 1819, considerable advantage was anticipated from importing this wool into England; as it was valued at eight shillings per pound. Byragee wool, however, when imported, was found to be unsaleable; as of 189 bales of Shawl and Byragee wool, imported in the years 1821, 1822, and 1823, costing exclusive of freight and charges £5,444, the gross sale proceeds amounted only to £809. This wool was bought from the Hoonea, who keep sheep with the shawl wool goats, by the people of Kunawur, and brought by them to Rampore, the capital of Bissehur, on the Sutlej. Specimens of the same kind of wool, procured by Mr. Hodgson from the Bootea who visit Nepal, were forwarded to the Court of Directors of the East India Company, in 1835, by Dr. Wallich. Of this the sorted wool was valued in London at from 10*d.* to 11*d.* per pound; some in the unsorted state at 5*d.* to 7*d.*; and some was sold in the London market in 1834 at from 2*d.* to 7*d.* per pound; the low price was chiefly owing to its dirty and mixed state. Attention was turned in England to the subject of Indian wool by Mr. Southey, of Coleman Street, addressing a letter, 24th November 1836, to the Committee of Agriculture of the Royal Asiatic Society, respecting some wool imported from Bombay. He suggested more attention being paid to the assortment of the wool, and improvement in the breed of the sheep; and stated that in 1835 there were imported into London 773 bags, and into Liverpool 624 bags of Indian wool which were sold by public auction at 4½*d.* to 1*s.* 2½*d.* per pound. The wool was chiefly white, but with black hairs occasionally interspersed; and he understood that it was produced in the province of Guzerat. In the following year, Mr. Southey again called attention to the subject, stating that the quantity exported from Bombay had enormously increased; but that what came to England was entirely of middling and secondary quality, and had, consequently, realized no higher prices than from 4½*d.* to 11½*d.* per pound. The great and rapid increase of the exports of wool from Bombay is evident from an inspection of the following extract from the official Report of the Commerce of Bombay for 1836-37;

1833-34	lbs.	69,944	1835-36	lbs.	1,196,664
1834-35	,,	486,528	1836-37	,,	2,444,019

The report of 1837-38 goes on to say, "The quantity of wool exported has increased from 2,444,019 lbs. to 2,700,086 lbs., valued at 98,564 rupees."

Sir A. Burnes, writing on the wools of Cabool and Bokhara, says—1. The wool of Turkistan is obtained chiefly in the neighbourhood of Bokhara and Samarcand, and is more celebrated than that of Cabool. This is sent to Umritsir in the Punjab, where it is used to mix with the shawl wool of Tibet, in making what are called Cashmere shawls. It is the produce of the goat of Bokhara and not of the sheep of Toorkistan, and is called "put," in contradistinction to pashm, which is used to express the fleece of the sheep. 2. The wool or put of the goat of Cabool is not at present exported, being entirely consumed in the native manufactures. It is procured from goats, and chiefly from the hill country of the Hazara to the west of Cabool, and between that city and Herat, which has an elevation of about 6,000 or 8,000 feet above the level of the sea. 3. The countless flocks of flat-tailed sheep in Cabool, produce an abundance of wool. The fleece is of a glossy white colour, and is in Cabool called pashm-i-burrak, and the fabrics prepared from it burrak, in contradistinction to puttoo. It sells at from two and a half to two Cabool rupees the seer, or sixteen pounds. It is brought in from all directions for sale in Cabool, and Sir A. Burnes states that he "can scarcely put a limit to the supply, since the extent of pasture land in those countries is not over-rated at four-fifths of the whole surface of the country, and a very large portion of the population, such as the Lohani and Ghilgee, are shepherds, who remove from pasture to pasture, and rear their flocks with great care and attention. Nature, however, does as much as the people; for aromatic plants, in which sheep delight, are exceedingly abundant, and it is universally believed that they have considerable effect on the quality of the wool."

Wool obtained from the fat-tailed variety of sheep is used in the manufacture of cloths and carpets, and is also exported to India. It is of wide distribution; the sheep abound at Peshawur, Kabul, Kandahar, Herat, and other places. Kelat and the surrounding country produces sheep's wool in great abundance. This sheep is apparently indigenous also to the Salt Range.

Kirman is a tract of country close by the Persian Gulf, to the south of Persia. Its wool finds its way into the Punjab in considerable quantities. It is a soft delicate wool, but its principal use, at present, unfortunately appears to be the adulteration of genuine pashm.

Wool from the Persian gulf called Kirmani wool finds its way to Amritsar pretty largely from both Karachi and Bombay. It is one of the staples used in adulterating the "pashm," or genuine shawl wool.

The Lena shawl wool is the produce of the goats of the Tibetan Himalaya. It used to be a prevalent opinion that these goats were found in Kashmir, but that celebrated valley is far too warm and damp for them. The best shawl wool is produced in the vicinity of Garoo, Mansurowur, and the elevated lands to the eastward. The shawl wool is the fleece of the goat, next the skin only; the outer coat is coarse hair, and the two colours are white and light brown. The dogs of Tartary have also a soft down below the hair, very little inferior to that of the goats. Goat's hair is very commonly produced in almost every district of the Panjab, and called "jat." It is used for making ropes, also for matting, and for the strong bags wherein grain, &c. is carried on the backs of oxen. Grain dealers use rugs made of it in the shops in which the grain is poured out when being winnowed or weighed. At Dala and Gyani, in Hundes, four or five fleeces of wool, according to size, sell for one rupee, which averages 1½ to 2 annas, or 3 pence the pound. Shawl wool is produced in a variety of districts in Thibet. Carmenia or Carmania wool is a kind of goat's hair, brought from Carmania, a country of Asia Minor.

The wool of Eastern Turkestan is known as Turfani wool, so called from the city of Turfan, it is this exquisitely fine wool from which the exquisite shawls and other fabrics of Kashmir are made.

The following wools are used in the Punjab.

(*a.*) Pashm, or shawl wool, properly so called, being a downy substance, found next the skin and below the thick hair of the Tibetan goat. It is of three colours, white, drab, and dark lavender (Tusha). The best kind is produced in the semi-Chinese provinces of Turfan, Kichar, and exported via Yarkand to Kashmere. All the finest shawls are made of this wool, but as the maharajah of Kashmere keeps a strict monopoly of the article, the Punjab shawl weavers cannot procure it, and have to be content with an inferior kind of pashm produced at Chathan, and exported via Leh to Umritsur, Nurpur, Loodianah, Jelalpur, and other shawl-weaving towns of the Punjab. The price of white pashm in Kashmere is for uncleaned, 3*s.* to 4*s.* per lb.; ditto cleaned, 6*s.* to 7*s.* per lb.; of Tushà white pashm uncleaned, 2*s.* to 3*s.* per lb.; cleaned, from 5*s.* to 7*s.*

(*b.*) The fleece of the Dumba sheep of Kabul and Peshawur. This is sometimes called Kabuli pashm. It is used in the manufacture of the finer sorts of choga, an outer robe or cloak with sleeves, worn by Afghans and other mahomedans of the western frontier.

(*c.*) Wahab Shahi, or Kirmani wool. The wool of a sheep found in Kirman, a tract of country in the south of Persia, by the Persian Gulph. It is used for the manufacture of spurious kinds of shawl cloth, and for adulterating the texture of Kashmir shawls.

(*d.*) The hair of a goat common in Kabul and Peshawur, called Pat, from which a texture called pattu is made.

(*e.*) The wool of the camel. From this a coarser kind of choga is made.

(*f.*) The wool of the country sheep of the plains. Regarding the production of wool in the Himalayan or Sub-Himalayan portion of the Panjab, the Revenue Report, for 1861, states that 'there can be no doubt that the valleys of the Sutlej, Ravee, Chandrabaga (or Chenab), Namisukh, and other tributaries of the Indus, supply grazing grounds not to be surpassed in richness and suitableness in any part of the world. The population inhabiting them are chiefly pastoral, but owing to sloth and ignorance, the wool they produce is but small in quantity, full of dirt and ill cared for in every way.' The Government of the Panjab have made efforts to improve the breed by the importation of Merino rams, but hitherto with little success. However, a truss of Merino wool produced in the Hazara hill district to the northwest of the Punjab, and sent to England in 1860, was there valued at 1*s.* 6*d.* per lb.

Raw pashm of the Thibetan goat is used in the manufacture of Kashmere shawls of the kind called Tusha, produced in Thibet.

A considerable and increasing quantity of wool is exported for India, mostly all of it, latterly, from Calcutta.

	lbs.	Tons.	Value, £.
1850— 1	4,682,074	2,090	68,335
1— 2	7,057,161	3,151	100,612
2— 3	12,060,799	5,384	172,098
3— 4	14,409,479	6,432	205,601
4— 5	13,113,727	5,854	207,264
5— 6	16,109,728	7,192	272,942
6— 7	18,484,666	8,252	314,215
7— 8	18,635,396	8,319	387,103
8— 9	15,688,196	7,010	349,895
9—60	19,562,897	8,733	436,672
1860—61	21,384,405	9,505	478,144

But in addition to these exports, vast quantities of wool are woven into blankets of various degrees of fineness, for the use of the people, called cum'l or cumli, also chad'r.

Mr. Powell mentions that all or most of the mammalia of the Himalayan regions and other similarly situated localities at an elevation of 11,000 to 13,000 and 14,000 feet, which are consequently subject to severe winters and a high rarity of atmosphere, whether domesticated or wild, such as the dog, yak, karghan, &c., possess a wintry inner coat of pam, of different degrees of fineness. The pashm of the goat is alone the marketable commodity; but the hair of the yak and Kirghiz camel is in parts cropped, and both in a cleaned and coarse state is made into cloth of different degrees of fineness for Kirghiz (nomadic) tents, clothing, bedding, saddle bags, ropes, &c., &c. The hair picked from marketable pam at Kashmir, supplies material for a different branch of manufacture, viz., of ropes, saddle bags, and hair cloth of different kinds, qualities and uses.

Antelope wool of Labaul, called in Tibetan Tsodky-i-lena, or properly b-Rtsodky-i-lena, is very precious.

Ibex hair, or wool of the teringole, or kin, the ibex, is the wool that makes the famous and rare ibex shawls.

Sheep's wool, black and white of Lahaul, called luggi-bal, was selling in 1866 for 6 kutcha seers per rupee; it is exported to Kullu and Kanawar.

Yak's wool of Rupshu and Zangskar, called Kullu, is the soft under hair of the yak, used to make bags for sheep loads, and the felt soles of shoes.

The Rampur chadr is a soft wool fabric manufactured from the wool of the sheep of Rampur and Spiti, which are there the beasts of burden. The wool of the Dumbah or large-tailed sheep of Peshawur and Kabul is called Kabli-pashm, and is manufactured into the choga or sleeved cloaks worn by the Afghans.

Pattu fabrics are made from the pat wool of Kabul.

Kirmani wool is beautifully soft and very white.

The pashm of Changtan and Turfan are of the first class, and are monopolized by Kashmir.

The pashms of Rodak, Ladak, Spiti, Rampur, Bashahir are a second class wool, and form the staple export to the shawl manufacturing cities of the Panjab.

The export trade in wools of the N. W. frontier, and beyond it in Kabul, Bokhara and Kirman, is extensive, and large quantities are exported to Karachi and Bombay.

Good ewes appear to be obtained in Coimbatore and Baramahal; but Jalna and Beder used to be the best places whence to obtain the white-woolled breed. The results obtained both at Bangalore and on the Neilgherry Hills, from crossing the white-woolled sheep of the country with Saxon, Merino and South-down rams, are stated to have been most satisfactory, both as to quantity and quality of wool, and size of carcass. At the Madras Exhibition of 1855, of specimens of woollen manufactures, the most remarkable were those from Hoonsoor, comprising white and colored blankets of various textures made in the native loom, some being imitations of English articles, and a decided improvement upon the country cumbly, and cheap in price. Among them was the description of blanket furnished to invalids and time-expired men proceeding to England. These are not manufactured for the European troops, being too thick, heavy and unsuited to the climate. English blankets are therefore provided instead; the comparative cost is as follows:

1	Hoonsoor Blanket...		...	1	12	0
1	Europe	do	red. ...	4	8	0
1	Do.	do	white ...	5	8	0

The jury considered this manufacture worthy of encouragement, and observed that means should be devised to improve the manufacture, especially as wool is abundant. The description of wool from which these were manufactured was then of recent introduction. In the Mysore country sheep thrive well, but the wool is coarse, and little used except for the manufacture of native blankets. About the year 1840, General Cubbon took charge of a flock from the Madras Government, which had been collected the year previously for the purpose of introducing Merino wool into the country; but that flock was useless, it having been attacked with rot. He then collected one at a farm about 60 miles west of Bangalore, and imported 3 or 4 rams annually from Sydney; these amalgamate so well with the country sheep, both in figure and size, that in the 4th cross it is not possible to distinguish farm bred from the imported ram. There were in 1850 about 6000 sheep in Mysore with Merino blood in them. Rams from the farm had been distributed to the collectorates of North Arcot, Bellary, Salem and Coimbatore. During the year 1850, 25 rams were sent to the Punjab by order of the Government of India. The wool had been very highly reported on by Messrs. Southey and Son, and several parcels had been sold in London as high as 1 shilling and 6 pence per lb., while the country wool, and that imported from Bombay, averaged only 4*d*. to 5*d*. per lb. There can be no doubt that when the Merino sheep is naturalized, wool will become a valuable article of export. A mercantile firm in Bangalore exported the wool of the Mysore country to England, in considerable quantity, and had realized a very fair profit. Eventually the Merino will be produced as cheaply as ordinary wool. Up to the year 1850 the quantity and value of wool annually exported from Madras was lb. 1,28,413, value Rupees 15,816. For a very large black cumbly from Kurnool closely woven, fine and soft in texture, the jury awarded, as the best specimen of the ordinary woollen manufactures of the country, a second class medal. A check cumbly from Chittledroog, was found deserving of honorable mention. The best specimen of woollens was found in the tariff, being a blanket made of corded wool of excellent quality and reasonable in price. A red cumbly of Mysore was exhibited in this collection, and was of good quality.

At the Great Exhibition of 1851, some fine merino wool was exhibited from the tableland of Mysore, and indigenous wools from the hilly country of the north-west frontier, some from Lahore, and other kinds from the dry and cold elevated climate of Tibet. Of the last, were some very fine specimens from Lieut. Strachey, many of the animals there being furnished with a down or hair-like wool under the coarse common outer wool. It is this which is chiefly employed for the shawls and the shawl-wool cloth. Though woollen fabrics of superior quality are not likely to be fabricated for the wealthy of India, yet as there are great diversities of climate in the different parts of Eastern and Southern Asia, some very substantial woollen cloths and blankets are made in different parts, amongst others, fine shawl-wool cloth in Cashmere; also the kind called puttoo; a fabric, named Pureepuz, the pile of which, on one side, is formed of loops. Felted blankets and cloaks have been manufactured from the table-land of Mysore, as well as from the north-west frontier, and from Nepal and Tibet.

The only woollen fabrics produced by the Chinese are felts for the soles of shoes and winter hats, and a sort of rug or carpet. It is not woven in looms from the yarn, but is made in small pieces by a fulling process which mats the fibres together. The consumption of it by shoe-makers is very great, and nearly as large for winter hats among the common people. The rags are woven with colored threads in rude imitation of figures, and are extensively used in the northern provinces; the pieces are a few feet square, and sown together for carpets or bedding. Hair and wool are both employed in their construction. The art of knitting is unknown, and of course also the fancy designs and worsted work which are made by ladies in the west.—*William's Middle Kingdom, vol.* II. *p.* 126. *Royle, Arts &c. of India, p.* 498. *W. WOOTHULU. Tel. Phaseolus mungo.

WOOT-THA. Burm. A tree of Moulmein. A strong wood for ordinary purposes.—*Cal. Cat. Ex.* 1862.

WOOTZ, or Indian Steel. The ore from which it is made is a magnetic oxide combined with quartz, generally in the proportion of 48 parts of quartz to 52 of oxide of iron. It is found in many parts of the south of India, but Salem is the chief seat of the manufacture, and there the ore is prepared by stamping and separating the quartz either by washing or winnowing. The furnace in which the ore is smelted is from three to five feet high from the surface of the ground, and the ground is hollowed out beneath it to the depth of eight inches or a foot. It is somewhat pear-shaped, being about two feet diameter at the ground and tapering to about one foot diameter at the top; it is built entirely of clay. Two men can finish one in a few hours, it is fit for use the next day; the blast is furnished by a pair of bellows each being a goat skin with a bamboo nozzle: a semi-circular opening about a foot and a half high and a foot in diameter at the bottom is left in the furnace, and before each smelting it is filled up with clay: the furnace is then filled up with charcoal, and kindled; a small quantity of ore, previously moistened to prevent its receiving the charcoal, is laid on the top of the fuel, and charcoal is thrown over it to fill up the furnace: in this manner ore and fuel are added and the bellows plied for four hours or thereabouts, when the process is stopped, and the temporary wall in front of the furnace having been broken down, the bloom is removed by a pair of tongs from the bottom of the furnace, and is then beaten with a wooden mallet to separate as much of the vitrified oxide as possible: and, while still red hot, it is cut through with a hatchet and in this state sold to the blacksmiths, who perform all the subsequent operations of forging it into bars, and making it into steel. The process of forging into bars is performed by sinking the blooms in a small charcoal furnace and repeated heatings and hammerings to free it as much as possible from the vitrified and unreduced oxide of iron: it is thus formed into bars about a foot long, an inch and a half broad, and about half an inch thick. In this state it is full of cracks and exceedingly red short. These bars are cut into small pieces to enable them to pack in a crucible. A quantity, amounting to a pound and a half to two pounds, is put into a crucible along with a tenth part by weight of dried wood of the Cassia auriculata chopped small; these are covered with one or two green leaves of the Calotropis gigantea or Obulus laurifolius, and the mouth of the crucible filled up with a handful of tempered clay, which is rammed so as to exclude the air perfectly. As soon as the clay is dry, twenty to twenty-four of the crucibles are built up in form of an arch with their bottoms inwards, in a small furnace urged by two goat skin bellows, charcoal is heaped up over them, and the blast kept up without intermission for about two hours and a half, when it is stopped and the process is considered complete. The crucibles are removed from the furnace and allowed to cool, they are then broken and the steel which has been left to solidify is taken out in a cake having the form of the bottom of the crucible. When the fusion has been perfect, the top of the cake is covered with striæ, radiating from the centre, but without any holes or rough projections on it: when the fusion has been less perfect the surface of the cake has a honey-combed appearance, caused probably by particles of scoriæ and unreduced oxide in the bar iron, and often contains projecting lumps of iron still in the malleable state. The natives prepare these cakes of steel for being drawn into bars by annealing them for several hours in a charcoal fire actuated by bellows, the current of air from which is made to play upon the cakes whilst turned over before it at a heat just short of that sufficient to melt them; by this means the excess of carbon is detached. The process of smelting iron differs according to circumstances in different parts. In some, the ore is collected in the form of sand from the beds of rivers; the iron stone is collected either from the surface or from mines.—*Rohde, MSS. Mad. Lit. Journ.*

WORAGALLI, a name of the town in maps called Warangal. See Worungul.

WORM. Several creatures receive this common name; a tailless batrachian, the Ichthyophis glutinosus, is an immense earth worm, common in Sikkim. It is a native of the Khasia mountains, Singapore, Ceylon and Java.

Amphetrite or sea worm of Java, lives in holes of the great solid madrepores. The gills of these lovely creatures are in the form of spiral ribbons of brilliant orange green and blue. These gaudy plumes are alternately extruded and retracted, and, seen through the pellucid water, present a very singular and beautiful appearance.—*Adam's Travels, p.* 51. *Hooker Him. This European plant is found in the Indian bazars. The Worm-wood of the Old Testament is the Artemisia abrotanum.—*O'Sh. Disp. p.* 414.

WORUNGUL. A town 90 miles N. E. of Hyderabad in the Dekhan. It is famed for its manufacture of superior carpets, the trade in which has considerably declined for want of patronage. In the town of Hunnumcondah, the head-quarters of the Worungul district, are the ruins of a famous temple, now fast falling to decay. The structure is composed of hard black granite, elaborately sculptured. Four large columns, highly carved, support a roof of solid granite slabs, although the legend runs, that a thousand pillars once supported the fabric, but a few now remain standing. Inside the pavilion is a gigantic bull (couchant), sculptured out of black trap, highly polished, which is an admirable specimen of workmanship of its kind. The temple is entered upon wide steps of solid black trap rock. The landing is in a porch supported by two advance columns, with elegantly sculptured bases, having massive parapets between them. The capitals and entablatures are likewise most exquisitely carved, with eaves hanging over them about five feet over their bearings. The building claims attention for its great antiquity, built, it is said, a thousand years ago by rajah Burthop Boothroo, to whom also is attributed the gigantic works scattered over the Worungul district, such as the great wall and fort of Worungul, and the embankment and masonry adjuncts of the Pakhall lake, &c. In the road from Hyderabad to within forty miles of Worungul, barren rocks, which intensify the heat of the sun, and arid plains, are the prevailing feature, and water is both scarce and bad. At Bonagherry, 26 miles from Hyderabad, is a hill fortress, or droog, planted on the summit of a precipitous rock, rising abruptly from the plain to a very great height; the road extends only to Hunnumcondah, a distance of 90 miles from Hyderabad.

WRESTLING in India is a favourite amusement for the rich, who keep largely overfed men for the purpose of being pitted against each other. These are so full of flesh, that their distinctive forms are almost hidden, though this is more owing to the development of muscle than to deposit of fat. On one occasion, to add to the interest of a mela, wrestlers of reputation from Agra, Muttra, Cawnpoor and other places were sent for, and for three mornings successively the rajahs and others were entertained with some splendid wrestling matches. There was no cruelty or brutality exhibited, but fair manly trials of strength and dexterity which elicited applause, and which attracted on the last day a crowd of at least 50,000 people.—*Delhi Gazette.* See Kushtigar.

WRIGHTIA, a genus of plants belonging to the natural order Apocynaceæ,—of which the following Indian species are known,

antidysenterica.
coccinea.
mollissima.
Rothii.
tinctoria.
tomentosa.
Wallichii

The Toungzalat of Burmah, a species of this genus, is a beautiful wood of British Burmah. A cubic foot weighs lbs. 55. In a full grown tree on the good soil the average length of the trunk to the first branch is 40 feet, and average girth measured at 6 feet from the ground is 5 feet. The Beejee-koorowan, URIA, of this genus, is a tree of Ganjam and

Gumsur, extreme height 25 feet, circumference 2 feet, and height from the ground to the intersection of the first branch, 8 feet. It is tolerably common, and is burnt for firewood. The milky juice is used for wounds.—*Dr. Brandis and Cal. Cat. Ex.* 1862. *Captain Macdonald.*

Ahir,	PERS.		

A small tree common in Mysore and the hilly parts of southern India, found in the hill jungles of Kotah and Mewar, a native of the coast of Malabar, of Ceylon, and the Isle of France, common in many parts of India, also in Tavoy: the wood is of little value, but the bark was formerly in request under the name of Conessi, and is still esteemed by the natives in dysentery and bowel complaints. It appears to have lost its value in commerce, by not being distinguished from the bark of Wrightia tinctoria, which grows in the same places. The very bitter seeds are boiled in milk, and given in hemorrhoids and dysentery, and in decoction in fever and gout; also as an anthelmintic. The bark of the root is astringent and febrifuge, and is used as a specific in dysentery and bowel complaints. Its medicinal virtues are worthy of attention. The bark was formerly in request under the name of Conessi, and is still esteemed a valuable drug by the natives in dysentery, and in most disordered states of the bowels. Its milky juice is also used as a vulnerary.

The tree has peculiarly-scented flowers with a form resembling those of the jasmine. The wood is white, of a fine grain, and susceptible of polish, and is used by the turner and cabinet-maker.

The seeds are covered with a kind of downy tuft, somewhat resembling the down of the thistle. Two kinds of indurjuo seeds are distinguished, the *sweet* and *bitter*. The former has a pleasant taste not unlike that of oats, which they also resemble somewhat in appearance; but are longer and more slender. An infusion of this roasted seed is given as a safe and gentle restrainer in bowel complaints; the decoction is employed in fever cases. The latter are intensely bitter, and used as a vermifuge. The bark was greatly lauded more than a century ago by Geoffroy, and it appears to be a remedy of no mean value. A new vegetable alkaloid extracted from the bark is resinous and uncrystalizable, of a powerfully bitter and somewhat acrid taste, insoluble in water, but very soluble in alcohol, ether and chloroform, only one part procurable from one thousand parts of dry bark; it is supposed that the seeds contain it in much larger quantities.—*Cat. Ex.* 1862. *Voigt. Fl. Andh. Faulkner. M. E. J. R. O'Shaughnessy, p.* 445. *Eng. Cyc. Ind. Ann. Med. Sci. Aug.* 1856, *p.* 397. *Hind. Theat. vol.* ii. *p.* 100.

WRIGHTIA COCCINEA is a large tree; flowers externally green, internally deep orange red, having something of the perfume of the pine-apple.—*Riddell.*

WRIGHTIA MOLLISSIMA. WALL.

Khilawa,	HIND.	Dudhia,	HIND.

Grows in the Naggery Hills in Kumaon, Bijnore and Gurhwal, and is abundant in some moist forests. It grows in the Siwalik tract near the Indus up to 3500. It is fine grained, light and durable, its wood is used by workers in carving and in turnery. It grows to the height of 15 feet. Its wood is light yellow, soft and white, not very durable, fine grained, polishes well; used chiefly for combs, and also for agricultural implements. The yellow juice might be turned to account, but the timber is of no value. For combs it is taken as far as Umritsur.—*Drs. Cleghorn, J. L. Stewart, Mr. Thompson. M. E. J. R.*

A small tree, found in the Coimbatore, Godavery and other forests of the Madras Presidency, and very common in all the forests of Bombay. It affords a very beautiful wood, white, hard and close grained; coming nearer to ivory than any Dr. Roxburgh knew. In the Coimbatore jungles, it attains a considerable size, but is not much in use there, but that of the Godavery is most valuable for turning. Pale green soft leaves; deciduous in the cold weather; flowers in March and April; white follicles in pairs, from twelve to eighteen inches long, which as they ripen the ends of each pair curiously join. The wood is used by turners and cabinet-makers. It is a common tree in the Coimbatore jungles. The leaves afford an inferior kind of indigo, hence the Mahratta name. It is extracted by scalding.—*Drs. Wight, Roxb. Fl. Ind. Gibson, Riddell, and Cleghorn, Captain Beddome.* See Dyes, Nilam pala.

Compared with other nations the use of letters in India is recent. Though, as Professor Muller mentions, we read in the Old Testament of writings, engravings, pens and books—in Exodus xxiv. 7; xxv. 16; and xxxii, 15, and 16, at least 1500 B. C.; in Job xiii, 26, xix, 23 and 24; perhaps about the same age, and subsequently in Psalms xl, 7; xlv, 1; lvi, 8, and lxix, 28, and in Proverbs iii, 3, at least 1000 years B. C.,—the first authenticated inscriptions in India are those of the third century before Christ, engraved at Kapurdigiri, Dhauli, Girnar, &c. In the ten Books (Mandala) of 1017 hymns in the Rig Veda, the art of writing is not even alluded to. At the time when the songs of the Rishi were collected there is no allusion to writing materials, whether of paper (papyrus) or bark (liber) or skins, nor is there any allusion to writing during the whole of the Brahamana period of Vedic literature. Even during the Sutra period all the evidence obtained from them but leads to the supposition that though the art of writing then began to be known, the whole literature of India was still preserved by oral tradition. The statements of Megasthenes and Strabo and Nearchus, however, show that, in their times, the art of writing was known in India, and that it was practised before the time of Alexander's conquests, nevertheless the origin of the Indian alphabet cannot be traced back much beyond the date of Alexander's invasion. The Lalita vistara, however, one of the canonical books of the buddhists, describes Sakya Sinha's entry into the writing school (lipi-sala), and the alphabet that he is described as learning is the common Sanscrit alphabet. But in the times even of Nearchus and Megasthenes, letters do not seem to have been a vehicle of literature. Nearchus describes the people as writing on compressed cotton; Megasthenes as making inscriptions on milestones, and Curtius says they wrote on the soft rind of trees. The inscriptions generally supposed to have been engraved by Asoka, three hundred years before the present era, with a view to promulgate the doctrines of Buddha, are therefore the oldest literary remains of India, but are upwards of a thousand years later than the era when the tablets were engraved on Mount Sinai.

In the Homeric poems there is no mention of writing, but at the time of Pesistratos, when the final collection of the Homeric poems took place, this was undoubtedly a collection of written poems. There is no mention of writing materials, whether paper, bark or skins, at the time when the songs of the Aryan rishi were collected, nor is there any allusion to writing during the whole of the Brahmana period. Even during the Sutra period all the evidence obtained but leads to the supposition that though the art of writing then began to be known, the whole literature of India was preserved by oral tradition only. The brahmans of India, part of the east Aryan race, even now-a-days, learn the Brahmana Sutras invariably from oral tradition and know them by heart. The Grihya Sutras describe every event in the life of a brahman, from his birth to his death, but not a word is inculcated about his acquiring a knowledge of writing. Writing was not known during the Brahmana period. Before the time of Panini and at the first spreading of buddhism in India, writing for literary purposes was unknown. Liber, the inner bark of a tree, indicates an early source of writing materials, *βιβλος*, *i e*, *βυβλος*, the inner bark of the papyrus, indicates another source, though now translated book, and even the word book, is the beech wood. Writing was practised in India before the time of Alexander's conquest, a summary of the statements of Megasthenes, Strabo and Nearchus would show that the people of India then knew letters, but that these were not used as a vehicle for literature. Curtius says they wrote on the soft rind of trees, Nearchus mentions compressed cotton, and Megasthenes notices inscriptions on mile stones. The same Lat or Bud'h characters found on the pillars at Delhi, Allahabad and elsewhere, are also found engraved on rocks. The ancient Bud'h alphabet is really the simpler and more elegant form of the refined Sanscrit. The Allahabad inscription is similar to that at Delhi, but has four short lines additional. There is a stone before lodged in the Museum of the Asiatic Society at Calcutta, which was found at Bairath near Bhabra, between Delhi and Jeypur, and has an inscription in the Bud'h character.

The same character is also found in two inscriptions at Junir, of which one is on the Naneh ghat. It is in keeping with the inscription on the Delhi pillar and on the rock at Girnar. The Girnar inscription was supposed by Mr. James Prinsep to be in the Pali language.

No Indian alphabet, however, can be traced back much beyond Alexander's invasion, for Nearchus says the Indians made paper from cotton. Moreover, the first well authenticated inscriptions in India are of buddhist origin, those of Asoka on the rocks of Kapurdigiri, Dhauli and Girnar, of the third century before Christ. These inscriptions call themselves lipi, writing; or Dharma lipi, sacred writing; and the engraver is Lipi Kara, and this last word being also used in the Sutras of Panini it may be adduced as evidence that he knew the art of writing.

The Semitic race, however, were acquainted with letters at least 1800 years B. C. Job not only gives one of the earliest notices we possess of the practice of writing, but in chapter xix. 23 describes four different modes of recording events. Oh that my words were now written! Oh that they were printed in a book! that they were graven with an iron pen and lead in the rock for ever! and Ezekiel iv. 1 is ordered to take a tile and portray upon it the city of Jerusalem. Ezekiel had long resided at Babylon, where events were recorded on tiles two feet long, one foot broad, and four inches thick; the drawing or inscription was made on the brick of soft clay, which was first hardened in the sun and then burned in a kiln, and the bricks at Babylon are found thus marked, seemingly by a stamp, while those found in Assyria seem to have been cut by the hand. In South Eastern Asia, children are still, as alluded to in Jeremiah xvii. 13, taught to form the written characters by tracing them in clean sand, also by writing them with a soapstone or potstone pencil or with charcoal, on a board painted black or white, or on the leaves of a black book. The leaves of the palms are used in all the two peninsulas, in Burmah and Ceylon, as books and as diaries, or for accounts in trade. The characters which have been used for Sanscrit, as seen inscribed on sculptures, have been manifold; the Kutila as at Vijayamunder, in Udayapur, and on a stone slab from a temple at Ranode and at Oojein. An old form of character is engraved on the Allahabad column, and that on one of two bronze tridents found at Gopendara in Garhwal was in this old character, the other being in nearly modern Deva-Nagari. The latter has been largely employed in writing Sanscrit in somewhat differing forms and, also, as it is now used, but another form of it is known as Kanouj-Nagari. The character on the Allahabad column is Deva-Nagari in transitu, identical with that of the Gaya inscription, and also like Mr. Wathen's inscriptions from Gujarat and those of Mahabalipur. The character of the Gaya inscription is known to be of the eleventh century. A seal was found at Aseerghur in Kandesh, engraved with a Deva Nagari, resembling the Gaya or Gour, approaching the Allahabad. That on the Bhitari Lat or pillar at Ghazipur, is not pure Sanscrit, nor easily intelligible, but its character is the same as Allahabad No. 2, or Kanouj Nagari, with numerous mis-spellings. At the ancient village of Maguta, district of Bhushana, on a stone slab, is an inscription in Sanscrit verse, the language and poetry superior to anything seen by the Bengal Asiatic Society's Pandit, Kamalakanta. The character used in the inscriptions is called the Kulda, and is midway between the Deva Nagari and the Gauri. Some of the vowel inflections wanting. The inscriptions at the Budda Gaya vaulted cavern, or Nagarjuni, are in old Pali, of date B. C. 280 to B. C. 247, and the character used in the inscriptions, old Lat. Those at Mathiah near Bettiah, at Behra, and at Rediah, are in Pali, of date 315 B. C., and the character used in the inscriptions is old Pali. The characters used in the inscriptions found on ancient sculptures in Southern Asia and India, may be briefly named as under :—

Allahabad Lat,
Allahabad Gupta,
Amaravati,
Aramæan,
Arian or Bactrian,
Bengali,
Bhilsa,
Chaldæo-Pehlvi or Parthian.

Mr. H. T. Prinsep gives the following list of transitions of the Indian alphabet from the time of Asoka, with some of the most marked local varieties at present in use, viz., those used in the sculptures of

Asoka's edicts of the 3rd century, B. C.
Western caves,
Sah inscription at Girnar,
Gupta inscription at Allahabad,
Valabhi Plates from Gujarat.
Kutila inscription of the 10th century A. D. at Bareli,
Nerbudda,
Kistna,
Telinga, modern,
Tibetan modern.
Square Pali,
Gujarati,
Punjabi,
Kashmiri,
Bengali,
Devanagari,

and he gives the following ten modifications of the Sanscrit alphabet from B. C. 543 to A. D. 1200, viz.,

Fifth century B. C., Rise of Buddism.
Uncertain; Western Caves.
Third century B. C., Sanscrit inscriptions of Asoka, Junagarh.
Second century A. D., Gujerat dated Plates.
Fifth century A. D., Allahabad inscriptions of the Gupta dynasty.
Seventh century A. D., Tibetan alphabet formed from Sanscrit.
Ninth century A. D., Kutila inscriptions from Bareilly, A. D. 992.
Eleventh century A. D., Bengali alphabet as now modified. Adisur, 1065 A. D.
Modern Deva-Nagari alphabet.
Old Pali alphabet of the Burmese, compared with A. D. 200.

At present, in the south and east of Asia, the Roman and Italic characters, with slight diacritic points, are used every where by the British, French, Dutch, Portuguese, Spanish and Danes, alike in writing, printing and engraving, and the simplicity and the facility with which they can be read, will, before a hundred years pass bye, commend them to the many races now occupying these regions. The Arabic letters and the Arabic numerals are, with some modifications, in use amongst the mahomedans of Arabia, Persia, Turkey, Turkestan, Afghanistan, Beluchistan and India, and its forms receive the names of Toghra, Naskh, Talik, Naskh-Talik, Shafia, Raqm, and Shakastah. The Cufic alphabet is not now in use. Amongst the hindu races of British India, the Devanagari character, with some modifications, is applicable to Sanskrit, Hindi and Marathi; many of the letters of the Bengali and Urya are modified forms of the Devanagari, but so changed as to need to be studied separately; the Malayalam and the Tamil tongues have each their own distinct forms of letters; the Telugu and the Karnata characters are almost identical. The Burmese, the Mon or Talieng have each distinct characters, the Malay language is written with letters modified from the Arabic, and the Chinese continue to use a character intended to be a painted illustration of the object to be indicated; the characters of the Japanese are also distinct. Most of the non-Aryan races of British India, even yet, at the close of the 19th century, use no written character; they affix their marks to documents, the implement or weapon in use with them, a dagger, a staff, a balance, a trowel, &c.; those of them who now write with letters have adopted one of the alphabets of the more advanced nations around them. The helot or predial slave races known in the peninsula as the pariah, the Holar, the Mhang, the Mhar, have no knowledge of letters; they have for two thousand years, been dwelling as the village labourers, in daily, hourly, contact with people following the bud'hist and brahminical teachings, but they have not acquired either the religion or the learning of their masters. The Gujar and Chamar of N. India are all illiterate. The great Gond nation, now partly under mahomedan rule, partly under British dominion, have no written character of their own, and very few of them know how to read or write; the same remark is applicable to the Bhil, the Mondah, Ho or Kol, the Kond or Ku,—perhaps all the Kolarian races. The Ahir, the Med, Mer, or Meena, the races in Bustar, none of the forest or mountain races, the Chaura, Saurah, Suar, Chensuar, or the Yanadi of the eastern side peninsula, the Toda, Kotah, Badaga, or Irular of the Neilgherry Hills, know how to read or write, nor is it known that any of the Kurb or Kurumbar, the shepherds of the peninsula of India, can read or write. This is remarkable, because with their great flocks, they must have numerous sales, the written record of which would be useful to them; but this remark is equally applicable to many other races engaged in trading transactions, such as the Binjara or Lambara, who till recently were the chief carriers throughout India, the Chakili, Muchi, or Chamar, leather workers; the Mali, or gardener races; the Beldar or Wuddara, labourers, road makers, tank diggers, who take great contracts for roads and other public works; and the smaller broken tribes, such as the Beder or Veddah of the peninsula and Ceylon, the Rhodia of that island, the Yerkala, the Kai-kara, the Bhonrah, the Makwa, and many others; the Mongol and Manchu of Central Asia have characters which they use in writing. It is not known whether the tribes near the Chinese frontier and Tibet, the Gyami, Gyarung, Takpa, Man-yak, Thochu, Sok-pa, Horpa, have any knowledge of letters, and the same remark is applicable to the broken tribes in Nepaul, particularly to the languages of the Kiranti group in East Nepaul. It is not known that any of the tribes near the valley of Assam, the Aka, Dofla, Abor, Bodo, Dhimal, Koch'h, Garo, Naga, Mishmi, Miri, Mikir, Singpo, Shendu or Khassya have any written tongue. The Reverend Dr. Mason and Mrs. Mason have taught letters to the Karen, but the Ku-ki, Ku-mi, Ka-mi, Pwo, Tak-pa, Khampa, Kham-ti, Shan and other tribes in the north of Burmah are not known to have any means of intercommunication other than speech. The Thai-race in the south of the Malay peninsula have a literature, but the negro, negrito, alfuro or papuan races, in the Andamans and eastwards to New Guinea, are all alike without any writing characters.

Notwithstanding the numerous languages in the Archipelago, the writing characters are only eight or at most nine in number. The Javanese alphabet, like all others in the Archipelago, is written from left to right, each letter is distinct and unconnected, and the writing is perpendicular and not slanting. It is the character used for the Javanese proper, the Sunda, the Bali, and it is believed the Lombok, and including Palembang in Sumatra, it is current among twelve millions of population. But in prior times, other characters to the extent of twelve in number, have prevailed in Java.

In Sumatra, beginning from the west, the first evidence of a native written character is among the Batak, and it is singular that a nation of cannibals should possess the knowledge of letters. There was assuredly nothing of the kind in Europe or continental Asia until long after men had ceased to eat each other. The form of the Batak letters is horizontal.

The Korinchi alphabet, among the people of this name in Sumatra who border on Menangkabau, has 29 characters and consists of horizontal or slightly raised scratchings.

The Rejang is the alphabet of Lemba and Pasummah on the western side of Sumatra. It consists of 23 substantive characters, formed of upright scratches or strokes, and on the whole it is more complete than either the Batak or Korinchi.

The Lampung nation, which occupies that portion of the south-western side of Sumatra which lies opposite to Java, divided from it only by the straits of Sunda, has its own peculiar alphabet, which consists of 19 substantive letters with double or treble consonants, making them up to 44. It has a great deal of that angular linear and meagre form which characterizes the other Sumatran alphabets.

The Achin and Malay of Sumatra are written in the Arabic character.

The Bima alphabet formerly in use amongst the Bima people in the island of Sumbawa, east of Sumatra and Java, has now given way to the alphabets of the Celebes.

In Celebes are two distinct alphabets, one of them the Bugi, at present in use over the whole island, and which extends to Bouton and Sumbawa and wherever the Bugi nation have settled or colonized. The modern Bugi has 23 substantive characters, consisting mostly of small segments of circles running horizontally. The Bugi letters have no resemblance to those of Sumatra, or Java, or even to the obsolete alphabet of Sumbawa. The other alphabet of Celebes is now obsolete.

The ninth and last alphabet of the Archipelago is the Philippine, that of the Tagala nation of the great island of Lucon or Luconia and consists of 13 characters. It is the only one existing in the whole of this group, and seems at one time to have been used among the civilized tribes of the neighbouring islands, having spread even to Magindanao and Sulu. The forms of the letters are rather bold and more complex than that of the Sumatran alphabets.

In the Archipelago, thus, are nine distinct alphabets, every one of which appears to be a separate and a native invention. But they are not only distinct from each other, they differ equally from all foreign alphabets. They are the produce of five large islands only out of the innumerable ones which compose the Archipelago. The most fertile and civilized island, Java, has produced the most perfect alphabet, and that which has acquired the widest diffusion. The entire great group of the Philippines has produced, and that in its greatest and most fertile island only, a single alphabet; even this one is less perfect than the alphabets of the western nations, in proportion as the Philippine islanders, when first seen by Europeans, were in a lower state of civilization than the nations of the west of the Archipelago. The tongues spoken, nevertheless, are very numerous; viz :—

	LANGUAGES.	Spoken at	Written character used.	Religion and books.
	1 Malay ...	Singapore..	Arabic	
	2 Javanese..	Java... ..	Javanese	
	3 Sassak ...	Lombok ...	...	Indigenes of Lombok, a pure Malay race, professing mahomedanism.
Celebes..	4 Macassar..	S. Celebes near Macassar.	Native...	Mahomedans.
	5 Bugis ...	Large part of S. Celebes	Native distinct from Macassar.	Do.
	6 Bouton ...	Boutong ...	....	A large island S. of Celebes.
	7 Salayer ...	Salayer ...	....	A smaller. do.
	8 Tomore ...	E. peninsula of Celebes; Batchian.... ...	....	Pagans.
				NOTE.—The people speaking these five languages of Celebes are of pure Malayan type, and all but the Tomore race are equal in civilization to the true Malays.
Celebes.	9 Tomohon.	Plateau of Minahasa.		These nine languages, with many others, are spoken in the N. W. Peninsula of Celebes, by the people called Alfuros. These languages are falling into disuse, and Malay is becoming the general medium of communication. Most of tho people are being converted to Christianity.
	10 Langowen			
	11 Ratahan..	S. E. coast of do.		
	12 Belang ...			
	13 Tanawanko	West do.		
	14 Kema ...	East do.		
	15 Bantek ...	A suburb of Menado.		
	16 Menado ...	Chief town.		
	17 Bolanghitam..	On N. W. coast between Menado and Licoupang		
	18 Sanguir islands & Siau..	....		Two groups of islands between Celebes and the Philippines. Tho inhabitants resemble the people of Menado.
	19 Salibabo islands, also called Talaut.			
	20 Sula islands.. ...	....		E. of Celebes, Malays of the Molucca type, Mahomedans.
Bouru.	21 Cajeli......	3 villages on the eastern side of Bouru.		These people are allied to the natives of Ceram. Cajeli people are mahomedans.
	22 Wayapo...			
	23 Massaratty			
	24 Amblau...	An island S. E. of Bouru		Mahomedans.
	25 Ternate...	The northernmost island of the Moluccas		Inhabitants somewhat mixed with the indigenes of Gilolo.
	26 Tidore ...	Next island of Moluccas		Inhabitants undistinguishable from those of Ternate.
	27 Kaioa islands..	North of Batchian.		
	28 Batchian... ...	....		Mahomedan; inhabitants, like the preceding.
	29 Gani.. ..	A village in the S. peninsula of Gilolo		Moluccan-Malay; Mahomedans.
	30 Saboe ...	Villages in N. Gilolo.		Inhabitants called Alfuros. They are indigenes of Polynesian type, but brown skins and Papuan hair and features. Pagans.
	31 Galela ..			
	32 Liang, &c. ...	Villages on the N. coast of Amboyna		Of mixed Malay and Polynesian type. They are mahomedans or christians.
	33 Morella and Mamalla ..	Do. in N. W. do		Mahomedans.
	34 Batu merah ...	A suburb of Amboyna.		Inhabitants of the Molucca Malay type, mahomedans.
	35 Lariki, Asilulu Wakasiho. .	In W. Amboyna		Mahomedans from Ternate.
	36 Saparua... ..	An island east of Amboyna		Inhabitants of the brown Polynesian type, and speaking the same language as those of Ceram, opposite.
	37 Awaiya...	Villages on the south of Ceram.		Indigenes of Polynesian type, now christians.
	38 Camarian.			
	39 Teluti and Hoya...	Villages on the S. coast of Ceram.		Mixed brown Papuan or Polynesian, and Malay type, mahomedans
	40 Ahtiago and Tobo....			
	41 Ahtiago... ...	Indigenes, inland from Ahtiago		Alfuros of Papuan or brown Polynesian type. Pagans.
	42 Gah...	E. Ceram...		Alfuros of East Ceram.
	43 Wahai	N. coast of Ceram..		Inhabitants of much of the N. coast of Ceram of mixed race, speak several dialects of this language. Mahomedans.
	44 Goram	Small islands E. of Ceram.		Of mixed race, Mahomedans.
	45 Matabello ...	Small island S. E. of Goram.		Brown Papuan or Polynesian race. Pagans.
	46 Teor	Small island S. E. of Matabello.		Do. do.
	47 Ke Islands ...	....		On the W. of the Aru Islands. True black Papuans. Pagans.
	48 Aru do. ...	....		W. of N. Guinea. True Papuans.
	49 Mysol coast ...	....		N. of Ceram, semicivilized Papuan with mixture of Moluccan Malays.
	50 Mysol interior.	....		True Papuans. Pagans.
	51 Dorey	N. coast of N. Guinea		Do. do. do.
	52 Teto ...	....		Intermediate between the true and the brown Papuans. Pagans.
	53 Vaiqueno in East Timor			
	54 Brissi in W. Timor ...			

55 Savu. ... 56 Rotti. ...	....	Islands W. of Timor, of mixed race with apparently much of the hindu type.
57 Allor ... 58 Solor ...	....	Islands between Flores and Timor. Inhabitants of dark Papuan type.
59 Bajau or Sea Gypsies	....	A roaming tribe of fisherman of Malayan type all over the Archipelago.

The most ancient Arabic character was the Kufic. It seems to have been the alphabet of the Arabians of Mecca. Some learned writers generalize about the propriety of every language having its own natural alphabet, forgetting that a new alphabet has not been born with every tongue. The single alphabet of Phœnicia has been modified for all the languages of Europe, and of Asia west of the Indus, and for all the languages of Northern Africa, except that the Tuarik of the great Western Desert have an alphabet of native growth. The received Roman, Grecian and Hebrew alphabets, have together all the consonants needed for Arabic, except three. When Europeans began to print Greek, they copied all the contractions of the manuscript, though these must have enormously increased the trouble of printing. After that, without the slightest real advantage, it was customary in dictionaries to give Anglo Saxon quotations in type, which was copied from the handwriting of the Anglo-Saxon manuscripts. German quotations in the modifications of Gothic type used in Germany, Danish in that used in Denmark, and so forth :—gradually these trammels have been thrown off, all but the Greek type. In Africa, amongst the Kirghis, and amongst mahomedans of India, a holy man, to cure sickness, writes an invocation on a board or slate or paper, which is washed off and given to the sick person to drink.—*Lubbock Origin of Civilization, p.* 16. *Crawfurd Dictionary of the Archipelago Prinsep Antiquities by Thomas, Wallace, Malay Archipelago, vol.* ii. *p.* 292-295. *Jameson.*

WRONGON. MALEAL. Arsenic.

WRY-NECK. Of the smaller British landbirds, few occur in India, and these are mostly rarities in the west, but the wry-neck is not uncommon, though little observed.

WUBOIKA. RUS. Calico.

WUCHNAK. MAHR. Aconitum ferox, *Wall.*

WUD, a name of Buddha.

WUDA. AR. Cowrie.

WUDALU. TEL. Phaseolus mungo, *Linn.*

WUDDAR. See India, Waddar.

WUDUGA. TEL. Alangium hexapetalum, *L.*

WUFAT-NAMA. AR. the history of one's death.

WUGI, a great maritime people of Celebes, the Maccassar men. See Bugi, India.

WUJAH-UL-MULK. See Kalmuck.

WUJERABAE. See Hot Springs.

WUJJU. See Kelat.

WUKAMA MARAM. TAM. Diospyros cordifolia, *Roxb.*

WUKEEL, or VAKIL. AR. HIND. PERS., an agent.

WUKKU. TAM. Crotalaria juncea.

WUKNA MARAM. TAM. Diospyros cordifolia.

WUL. SW. Wool.

WULENA. HIND. Sterculia Wallichii.

WULHE KEERAY. TAM. Convolvulus repens, *Linn.*

WULLABHIPUR. See India.

WULLEE, or Wali. AR. a saint who can perform miracles.

WULLEK, of the maps of India, is supposed by Colonel Tod to be the ancient city of Balabhi. It is now an inconsiderable village. See Balhara.

WULL-ELLU, also Ellu. CAN. Sesamum orientale.

WULLI KIRAI, or Vulli Kirai. TAM. Convolvulus repens.

WULLY-KOLA. BENG. HIND. Musa sapientum.

WULUR, a lake 12 miles long, in Kashmir, through which the Jhelum flows; on its little island are the remains of one of the ancient temples of Martund.—*Adams.*

WUL-WALA. TEL. Dolichos uniflorus, *Linn.*

WUMA MARA. CAN. Calophyllum inophyllum, *Linn.*

WUMB. MAR. Nephelium longanum.

WUNDE. CAN. Female tree of Calysaccion longifolia, *Roxb.*

WUNGU, or Ketangi wood, of Java, is often used instead of teak : the grain is somewhat finer; when in full blossom, it is perhaps the most beautiful tree existing.

WUNI, of Java, affords a reddish wood.

WUNJAH MARAM. TAM. Acacia amara, *Willd.*

WUNJOOLI MARAM. TAM. Cedrela toona, *Roxb.*

WUN SENTAKI. See Japan.

WUNT. SANS. The second titular honor given to a hindu in India, as Raja Eshwara Doss, Dyawunt Bahadur, also Raja Indrawunt Bahadur.

WURAK. HIND. PSHTU. Rhamnus virgatus, also R. Persica?

WURD. ARAB. Rosa centifolia, *Roxb.*

WURDA, tributary to the Wein gunga, rises in the Satpoora mountains in lat. 21° 44′ lon. 78° 25′ and runs generally N. W. to S. E., length about 250 miles. It receives the

Payne Gunga, 320 miles. About 8,000 sq. miles are drained. It is fordable, except at the height of the rains; then navigable for 100 miles above its mouth. See Sanatoria. Wardah.

WURFEL. Ger. Dice.

WURFEL-SALTPETRE. Ger. Nitrate of soda.

WURIA. Hind. Corylus colurna.

WURNA SANKRA. Sans. Mixed castes, said to be employed in Northern India to include new castes admitted into the Hindu religion. The only mixed castes to be found in Southern India, consist of illegitimate children, the offspring of the dancing girls attached to the temples, of whom the girls are brought up to their mothers' occupations, and the boys as temple florists and musicians.

WURRIALE. Guz. Hind. Fennel seed, Nigella sativa.

WURRUS. Mar. Bignonia quadrilocularis.

WURZEL. Chenopodiaceæ.

WUSAWEH. See India.

WUSEEAT NAMEH. Arab. A will or testament.

WUSEEQA. A bond or written agreement.

WU-SUNG. See Shanghai.

WU-TSAU. China. Tiger poison. This is a well prepared extract from a root grown in the interior of China, which presents all the appearance of Aconitum ferox. A very minute quantity of the Wu-tsau when put on the tongue, produces intense tingling and numbness in the tongue and lips, after it is chewed. The Wu-tsau is the name of the plant from the root of which the poison is prepared. It is used by certain tribes in the interior of China.

WUTTAN. Ar. Hind. Pers. A native country, a patrimony, a property. The term Wuttundar is fondly cherished by a class of hereditary officers in Central India as their distinctive appellation, and means there a holder of native or home rights.—*Malcolm's Central India. vol.* i. *p.* 176.

WUTTU, a Rajput race in the tracts along the Sutlej, about Pakpatta.

WUZAET. Ar, a daily performance of duty.

WUZEEREE, one of the largest and most important tribes in Afghanistan, brave, warlike but predatory. They hold the rugged and lofty hills adjoining the south-west portion of the Kohat district (that is, the western part of the Meeranzye valley and the hills round Bahadoor-kheyl,) and the north-western border of the Dehra Ishmael Khan, that is, the valley of Bunnoo, and the plains of Murwut and Tank. These hills run down to the point where the great Suleeman range commences; near this point the Goomul range debouches from the hills almost opposite Tank. The valley of the Goomul forms the Golaree Pass through which a large portion of the traffic to and from Affghanistan and Central Asia enters into India; and scarcely inferior to the Khyber Pass of Peshawur or the Bolan Pass of Sindh. The hills on either side of this pass are held by Wuzeeree; the Wuzeeree hills form the western limit of the Joorduk Pass, which is the main line of communication between Bunnoo and Kohat. Just to the east of this pass lies Bahadoor-kheyl, and also the villages of Kharrah and Lutumur, at which three places the Trans-Indus mines are situated. The Wuzeeree hills also command the outlets of the Koorum and Goombelie rivers into the Bunnoo valley. The Wuzeeree tribe are numerous and sub-divided into various sections. The birth place of this race would seem to be the snowy range, which runs to the south-east of Jelallabad and Cabul. From this range they appear to have moved downwards towards the Derajat border. They are noble savages of pure blood, pastoral habits, fierce disposition and wild aspect. They can muster probably (were the whole tribe united), as many as 20,000 or 30,000 fighting men, and if combined might make themselves formidable. But though they are less addicted to internecine contests than other hill tribes, and are so far united, they are yet not apt to join all these forces together against an external foe. They are bold and ferocious: but as soldiers, not equal to the most martial tribes. Many of them live in tents, or in temporary dwellings resembling tents; in the winter frequenting the more genial clime of the lower ranges, and in summer retreating to feed their flocks in higher altitudes. Some of them have engaged in cultivation and have encroached on the weaker tribes of the plains; of these, again, many will only cultivate during the cold months; and as the heat approaches will reap their crops and retire to the mountains. But the tendency to extend their cultivation, and even to settle in the plains, has of late years been increasing among the Wuzeeree. The tribe generally is quite independent, both of the Kabul and the British governments; but some members of the clan who have taken up their abode as cultivators in the Bunnoo valley have become British subjects. Many sections of Waziri have, ever since British connexion with the frontier, maintained peaceable relations with the British. These people, driving the aborigines of Bunnoo before them, have occupied pasturage grounds on the western border of the valley, and have taken possession of cultivated lands in the same vicinity, amounting to about one-third of the culturable area of the valley. Under the Sikh regime, there were constant disputes between these Wuzeeree and the government (inasmuch as revenue could in those days only be collected by force of arms), and also between them and the Bunnoo people, who asserted claims they could not enforce, to a patrimony which had been gradually usurped. In 1848, Major Edwardes effected a settlement with these Wuzeeree and with all the inhabitants of the valley on behalf of the Sikh government; he confirmed them in their possessions, and arranged with them for the regular payment of their dues to the ruling power. These Wuzeeree continue as valued agriculturists and tax-payers. The condition of these people is satisfactory to themselves and creditable to British rule. Three sections of the Wuzeeree tribe misbehaved, namely, the Cabul-kheyl, the Mushood Wuzeerees (both of which entirely dwell in the hills and have no possessions in the plains,) and the Omerzye Wuzeeree, which latter clan originally cultivated in Bunnoo and afterwards rebelled. The Cabul-kheyl Wuzeeree inhabit the northern portion of the Wuzeeree hills, not far from the right bank of the Koorrum. They are near neighbours of the Tooree. They overlook the western portion of Meeranzye and they adjoin the Bahadoor-kheyl subdivisions of the Kohat district. They were a wild lawless set, always ready to join with the Tooree, Zemoosht Affghan, and Orukzye, in any mischief, such as raids on the Bungush and Khuttuk villages of the Kohat district. In the autumn of 1850 they signalized themselves by an audacious attack on Bahadoor-kheyl and its salt mines. For this purpose they assembled in considerable force and induced many of the Khuttuk villages round Bahadoor-kheyl itself to league with them. The affairs with the Omerzye have been serious. Like other Wuzeeree, they at first cultivated in the Bunnoo valley lands which had been wrested from the Bunnoochee of the neighbourhood. The head of these Bunnoochee was a local chief named Bazeed Khan. The Omerzye used to pay their revenue through this man, who was responsible for the collection. Some of the Omerzye used to reap the harvest, go off to the hills, deserting their land, and leaving Bazeed Khan to pay instead of them. The Mushood section of Wuzeeree is strong and mischievous. They inhabit the most southern of the Wuzeeree hills. It is the section which occupy both sides of the Goleeree Pass. Even they were hardly strong enough to attack the caravans of hardy, well-armed traders from central Asia. But they plundered any travellers they could, and they perpetually carried off the herds of camels chiefly belonging to merchants that grazed near the foot of the hills. Surrounded by the Wuzeeree hills, and adjoining the western border of Bunnoo, is the small valley of Dour, inhabited by a distinct race, and containing about 8,000 inhabitants. This valley originally belonged to the Dooranee kingdom. It was, together with other outlying tracts, formally ceded to Runjeet Singh by the tripartite treaty of 1838; but afterwards, in 1847, the British relinquished all claim to it on behalf of the Sikhs. The people of Dour more than once expressed a wish to come under British jurisdiction, but the offer was not accepted. During the treaty negotiations of 1855, the ameer of Kabul's representative urged that the valley once formed an integral portion of the Dooranee empire, and that His Highness now wished to take it, provided that the British did not claim any title. The government replied that the British did not desire to assert any claim, nor to interfere with the ameer, if he chose to re-annex it to his kingdom.

Below the Wuzeeree limits, a little south of the Goomul river, are the Sheorani hills, stretching from the latitude of Dehra Ishmael Khan downwards to nearly the latitude of Dehra Futteh Khan, a distance of fifty miles. In these hills is the lofty square-shaped mountain called Tukht-i-Suliman or Solomon's Throne, which gives its name to the Sulimani range, running for 300 miles parallel to the Indus and forming the western frontier of British India. At the base of this mountain runs the important Zerkunnee pass, the high road for caravans to and from Kandahar. The Sheorani are of Pathan lineage, of inferior stature to the Wuzeeree; they are warlike and predatory, and quite independent. The number of their fighting-men has been set down at 10,000; but this is found to be high. They can muster 1,000 men within a day's notice; in the course of three or four days they could muster 3,000 more. They adjoin the British tracts of Tak (partially) in the north, then Kolachee, then Durrabund, and lastly Choudwan—all in the Dehra Ishmael Khan district, and forming the border plains of the Upper Derajat up to annexation. With all the above tracts the Sheorani were long at feud. They would attack towns, burn villages, and carry off prisoners and cattle. The people of the plain would make reprisals and retaliation, and thus the feud would be inflamed. The Sheorani were so much feared, that the arable lands skirting the base of the hills were all left untilled, and the neighbouring plain villages paid them regularly one-fourth of their produce to buy off depredation, the Sikh government being unable to restrain them.

South of the Sheorani hills on the conterminous of the Dehra Ishmael Khan and Dehra Gazee Khan districts, there dwell the small Pathan tribe of Oshterani, mustering about 1,000 fighting-men. They are brave and pugnacious, but not predatory. They dwell chiefly in the hills, and are, so far, independent; but many of them possess and cultivate lands in the plains at the foot of the hills, and consequently within British territory. Before annexation they used to be quite as violent as their neighbours, especially during the continuance of a deadly feud with the Kusranee. The quarrel was, however, composed by Major Edwardes before annexation, and subsequently they have evinced a good and friendly disposition. On the border of the Oshterani hills, and nearly opposite to Dehra Futteh Khan, is the Vooch or Korah pass, faced by the British outposts of Doulalwalla and Vehoa. This point is of some topographical importance, as constituting the boundary line between the Pathan and Beloch tribes. The internal history of this remarkable tribe is fully set forth in the volumes of Mr. Elphinstone and Major Edwardes.—*Recd. Govt. India, No.* 2.

WYALA. Tel. Vitex negundo, *Linn.*

WYANG, in the Gillolo Passage, 9 miles S. E. of Syang, is the most northerly of a range of islands stretching from Syang to Waygiou.—*Horsfield.*

WYANG. A play or theatrical representation of the Javanese.

WYNAAD, a district in the Madras presidency, on the western slopes of the western ghats, in which coffee plantations have been larger and successfully formed. There is little forest land remaining, save in the mountain ranges adjacent to the differents ghauts. From the Pariah Pass to Sultan's Battery, a distance of some forty miles, the traveller meets with nothing but open grass land interspersed with paddy-fields, instead of those dense jungles breathing fevers and pestilence. Perhaps, as late as the present century, much of that arid grass land described as extending from Pariah Pass to Sultan's Battery was forest. This may be traced from the fact of the different temples aud places held sacred by the natives being almost invariably surrounded by a patch of heavy forest. This quiet yet rapid destruction of valuable land has been caused principally by the encouragement given to Rhagi cultivation, where a patch of noble forest is felled for the production of one crop of miserable grain, and then left to generate a mass of rank weeds and stunted bushes, while the same wasteful process is repeated year after year on the adjoining virgin land. In 1860, a tax was levied in lieu of the export duty, which has been abolished. The amount is two rupees an acre on land actually planted with coffee, such coffee being three years old. The tax is not excessive, if we take the average yield of an acre to be 6 cwt., worth 40s. per cwt; the rate is far less than the Ceylon 2½ per cent. In 1860, the coffee estates were as under:

			In Coffee 3 years old.	In Coffee under 3 years.
		Acres.	Acres.	Acres.
South Wynaad.........	25	9,740	2,708	1,849
South-East Wynaad..	16	5,414	1,244¼	185½
North Wynaad.........	24	8.995	1,928	2,876
Total...	75	24,149	5,880¼	4,910½

From these figures it appears that in 1860, in Wynaad alone, and exclusive of Mysore, Coorg, &c., there were 75 separate properties with a total acreage of 24,149, of which considerably more than one third is in bearing. Taking the coffee—young and in full bearing, together, we presume Wynaad produced about 40,000 cwts. of the berry. Native cultivation probably makes up 50,000; all the rest of the coffee plants growing in Southern India produce more than an equivalent, say 100,000 cwts. in all. In regard to *quality*, prices current in which Cannon's Mysore ranks with Mocha, have decided the point in favour of Madras. The Wynaad forest lands are principally contained in the four Umshom adjoining the teak forests, viz., Moonanad, Ganaputhyvuttum, Ellornard, and Poolpully dasum of Koopatode. They contain blackwood, &c., and much bamboo land, in many places the land is well fitted for coffee. The destruction of these forests not containing teak for the bonâ fide cultivation of coffee, may be considered legitimate; but not so for raggee, which spoils the land for ever from being cultivated for coffee. Government also possess some forest lands towards Periah and Teriate, and in several spots over Wynaad. In the teak belt are several bands of Coorumbur, some of the Jani, and others of Mooly caste; they amount to about,

Coorumbur......	200	Panniar and Pooliar.	100
Gurchea.........	50	Chetty and Squatters.	50

The former live entirely in the forest. They are the only axe-men, and without them it would be difficult to work a forest. The Coorumbur, through their headmen, are held responsible, and the Chetty are also responsible for their Panniar or farm slaves. The Coorumbur has no lack of labor. His services are constantly called for by the wood contractor and the planter. They will not leave their haunts in the forests for any time.—*Rep. Con. For. p.* 26, *and* 1861-62 *p. I.*

WYN-GANGA, or Ban Ganga. See Wurdah.

WYN-STEEN. Dut. Tartar.

X

X is the 24th letter of the English alphabet, and has been borrowed from the Greek. At the beginning of words it has the sound of Z, at the end of words and in the middle of some, it takes the sound of ks, as in lax, axis, but in the middle of other words it has the sound of gs, as in example, exhaust. It has been sometimes the practice to represent the Sanskrit ksh by the letter x, but ksh is an acknowledged compound of k and sh, and its representation, therefore, by a single letter is not advisable nor is it necessary.

XA-KA, a mode of writing the name of Sak'hya. See Buddha.

XALBANE or Χαλβανη. Gr. Galbanum.

,, radiatus, *Edw.* Mauritius.

XANTHOCERAS SORBIFOLIA.

The tree.

Wan-kwang-kwo, Chin.

This beautiful flowering tree is common in Peking, the N. of China, at King-chau or Pek-chih-li.—*Smith.*

XANTHOCHYMUS, a genus of plants belonging to the natural order Guttiferæ. Of these the X. pictorius, the most important, is a native of the valleys among the Circar mountains; the X. tinctorius of Linnæus has lanceolate acuminate leaves, wrinkled petioles and fruit 1-4 seeded.

The Mot-mooshun-hoonoo, Can., of Canara and Sunda is a large Garcinia, or a Xanthochymus. It occurs above the ghats only, where common, to the south abundant. Juice is not used medicinally, wood good, fruit is eaten.—*Eng. Cyc. Madras Exh. Jur. Rep.* See Clusiaceæ, Stalagmitis pictoria.

XANTHOCHYMUS MANGOSTANA. *Ainslie,* syn. of Garcinia mangostana, *Linn.*

XANTHOCHYMUS OVALIFOLIUS is found in the Rangoon, Pegu and Toungboo districts, but is rather scarce; it was at one time supposed to yield gamboge.

XANTHOCHYMUS PICTORIUS. Roxb.

Stalagmitis pictorius, *G. Don.*

Rata,	Ghorka.	Dampel ?	Tel.
Dampel,	Hind.	Chikati mraku,	,,
Iswaramamadi,	Sing. Tel.	Tamalamu,	,,

This beautiful tree is remarkable for its black flowers. It grows in the mountainous districts of India. Is very plentiful in the Rangoon, Pegu and Toungboo districts. It was formerly supposed to be one of the trees yielding gamboge, but the product is found not to possess the elements of gamboge.—*Rohde, MSS. Hind. Theat. vol.* ii. *p.* 101.

XANTHOPHYLLUM, *Species.*

Sa-phew. Burm.

A very large tree, growing in Martaban, where it is used for posts and rafters. There are two species of Xanthophyllum in Tenasserim.

XANTHOPHYLLUM FLAVESCENS. Roxb. A large tree, a native of the hilly parts of the province of Chittagong.—*Roxb.* ii. *p.* 222.

XANTHOPHYLLUM VIRENS. Roxb.

Gundee. Beng.

A large timber tree of the forests of Sylhet, wood remarkably hard and useful.—*Roxb.* ii. *p.* 221.

XANTHOUS TRIBES. See India.

XANTHOXYLACEÆ. Lindl. A natural order of plants, comprising 8 Gen. 37

sp., viz :— 3 Brucea ; 22 Xanthoxylum ; 1 Blackburnia ; 1 Lacruris ; 4 Toddalia ; 4 Arlantus ; 1 Euryconia ; 1 Pteleea.

XANTHOXYLON, a genus of plants belonging to the Xantholaceæ, of which the following are S. Asia species.

X. alanthoides, *S. & Z.* Japan.
,, alatum, *Roxb.* Nepal, N. India.
,, avicenniæ, *D. C.* China.
,, budrunga, *D. C.* Assam.
,, hostile, *Wall.* Himalaya.
,, limonifolium, *Wall.* Khassya.
,, nitidum, *D. C.* China.
,, obovatum, *Wall.* Khassya.
,, ovalifolium, *W.* Shevagherry hills.
,, piperitum, *D. C.* Japan.
,, planispinum, *S. & Z.* Japan.
,, rhetsa, *D. C.* Peninsula of India.
,, schinifolium, *S. & Z.* Japan.
,, sepiarium, *W.* Pulicat Hills.
,, triphyllum.
,, violaceum, *Wall.* Nepal.

This genus now includes Fagara, extending northwards into the temperate zone, and species of the same genus occur in China and Japan, and extend in India to Simla in 31° N. latitude, where X. hostile, differing little from X. alatum, is found. Other species run southwards along the Himalaya to Nepal and Silhet, and then to the Malayan and Indian peninsulas, whence we may trace them to the African islands on the east of that continent. In India, X. budrunga, rhetsa, alatum, and hostile, are used, wherever they are indigenous, for the warm spicy pepper-like pungency of their capsules, a property which is participated in by their bark and other parts. The capsules and seeds of X. hostile, called tej-bul by the natives, are employed in northern India for intoxicating fish, and chewed as a remedy for tooth-ache ; they are also given as the Faghureh of Avicenna, as X. piperitum and avicenniæ are in China and Japan, and are considered an antidote against all poisons. Dr. Royle has no doubt that in many cases they would be of considerable use as a stimulant remedy. The bark of yellow hercules (Xanthoxylum ochroxylon), and the pods of Acacia tortuosa are used for tanning in the West Indies.—*Roxb. Fl. Ind. Royle Ill. Him. Bot. p.* 157.

XANTHOXYLON ALATUM. ROXB.

Shuh-tsiau,	CHIN.	Ch'uen-tsiau,	CHIN.
Ch'uen-tsiau,	,,	Pepper-wort,	ENG.
T'sin-tsiau,	,,	Durmur,	HIND.
Hwa-tsiau,	,,		

A native of Nepal and the hilly countries north of Bengal, Rohilcund, and Oude, eastward to China, flowering in Calcutta in the hot and rainy seasons ; every part of the plant possesses a peculiar aromatic pungency, and the jet black seeds are used medicinally by the natives.—*Roxb. Smith.*

XANTHOXYLON AVICENNIÆ. syn. of Fagara avicenniæ, *Roxb.*

A native of China, a powerful stimulant, and used as an antidote against poisons.—*Roxb.*

XANTHOXYLON BUDRUNGA. *DC.*

Fagara budranga, *Roxb.*

Toung-than,	BURM.	Young-tha-ji,	BURM.

A tree of Assam, and in Silhet is called budhrung ; the seeds, which have a warm spicy flavour, the natives use medicinally. It is a small thorny tree, the dry capsules of which are found in the bazars of India, under the name of Kek-ka-la. The seed abounds in a rich aromatic oil. The bark and large thorns of the trunk are used in India and the seeds are sold in the bazars under the term tejbul or tezbul. The tree is about twenty feet high in the Pegu and southern parts of the Tounghoo districts, where it grows upon the banks of streams ; in the Pegu and southern parts of the Tounghoo districts it affords a plentiful supply of oil-seeds, which has not as yet been taken advantage of ; the fruit is about the size of a pea, and the outer coat contains an exceedingly fragrant balsam.—*McClelland.*

XANTHOXYLON HOSTILE. WALL.

X. aromaticum.

Timber,	HIND.	Tirmal,	RAVI.
Timbur,	,,	Tezmal,	,,
Timbru,	,,	Timur,	,,
Tirmar,	RAVI.		
Seed.		Bark.	
Tezbul,	HIND.	Kababa,	HIND.

This scandent shrub is common in north-west India and the North West Himalaya up to near the Indus, in Kaghan, in Kashmir and Kamaon. It is strongly armed with prickles, hence its name hostile. Its twigs serve the natives as tooth-brushes ; thicker branches are useful in carving and turnery, are made into walking sticks and clubs, used by the faqueers also to triturate the hemp plant in preparing their beverage. In using a triturator possessing pepper-like aromatic qualities, they save the pepper, which is usually added to the hemp plant. The capsules and seeds are employed for intoxicating fish, and are chewed as a remedy in toothache. Honigberger used the seeds and the bark together with the sharp prickles which are attached to it by large bases. The aromatic fruit is used as a condiment. The capsules and seeds are used for intoxicating fish, and are supposed to be the Faghureh of Avicenna.—*Thirty-five Years in the East by Honig. p.* 365. *Mr. Thompson. Dr. J. L. Stewart. Cleghorn Punjab Report, Kullu and Kangra p.* 8.

XANTHOXYLON PIPERITUM.

Wu-chu-yu, CHIN.

It grows in India, in Japan, and in China. It furnishes a powerful aromatic, used by the Chinese in the room of ginger and pepper. The active principle resides chiefly in the fresh leaves, the dry bark, and the pericarp.

The physicians of the country, in sore throats, apply a poultice made of the bruised leaves and rice flour. In India X. budrunga, X. rhetza, X. alatum, and hostile, are used, wherever indigenous, for the warm, spicy, pepper-like pungency of their capsules, a property which is participated in by their bark and other parts—*O'Sh., p.* 642. *Quoting Lindley's Flora Medica, p.* 215. *Royle p.* 157.

XANTHOXYLON RHETSA. *D.C.*; *W & A.*; *Rh.*

Fagara rhetsa, *Roxb.*

Mulila,	MALEAL.	Rhetsa maram,	TAM.
Kattoo-keena-gass,	SINGH.	Rachcha manu,	TEL.

Grows in the central province of Ceylon and near Colombo, also on the coast hills of peninsular India, the Circars, the Anamallay, the western forests generally; in the Tamil language Rhetza-marm means council-tree, as it is under the branches of this tree that the hill people assemble to discuss all matters of public interest.—*Thw. En. Pl. Zeyl.*, i. *p.* 69, *Voigt. p.* 185. *Roxb. Fl. Ind.* i. 417.

XANTHOXYLON TRIPHYLLUM. JUSS. *W. Ill. and Ic.*

Xanthoxylon zeylanicum, *DC. Prod.*	Fagara triphylla,
Evodia triphylla, *D.C.*	Loonoo-ankenda-gass. SINGH.

Very abundant in Ceylon up to an elevation of 5,000 feet. A var. β. occurs near Ratnapoora. A resin is obtained from this tree, but judging from the specimens it appears to be produced in too small quantities to be useful in a commercial point of view.—*Thw. En. Pl. Zeyl.* i. *p.* 69.

XATIFAH. MALAY. Carpets.

XAVIER. Francis Xavier, or Father Francisco Xavier, was a joint founder, with Loyola, of the order of Jesuits, and was subsequently canonized by his church. The Jesuit body of christians have been the most politic of all proselite makers. Every where their's has been a career at least of temporary triumph, in China, India, and the regions of the south Pacific. When, in 1549, St. Francis Xavier, by his mission in the Peninsula of India, had opened the way into the region of the further East, he proceeded with his Bible to the islands, to preach the gospel in the name of the Supreme Church. In 1547, the salvation of Malacca from the Achinese was ascribed to the sudden appearance of Saint Francis Xavier, the apostle of India, who was then on his pilgrimage through the East, and had recently made 600 or 700 converts among the pearl fishers of Manaar. At the period of his arrival, Malacca was threatened by a formidable invasion from the opposite island of Sumatra, which was delayed though not abandoned. He visited Ternate in 1546. He afterwards returned to Malacca and visited Japan between the years 1547 and 1549, and, by his efforts, the christian religion was fairly established by 1550, but in the year 1597 their persecutions began, and numbers, variously stated at from 300,000 to 1,000,000, were massacred and hurled from rocks. Xavier quitted Japan for China in 1551, and died on the 2nd of December 1552, at Shan-Shan, on the Canton river, not far from Macao.—*MacFarlane, Geo. and His. of Japan, p.* 3, 6. *John's Indian Archipelago vol.* i. *p.* 163. *Hough, Christianity in India*, ii. 1 iii. 188; *Abbe du Bois*, 3. *Bikmore*, 307.

XEMA RIDIBUNDA. Larus ridibundus, or 'Black-headed Gull' of Europe, Asia, N. Africa, is not rare in India, but is less common than the nearly affined X. Brunneocephalus.

XENODERMUS. See Hydridæ.

XENOKRATES. The name of Dhanakakata is found in no less than four of the cave inscriptions, in all of which it has been read by Dr. Stevenson as the name of a man whom he calls Xenokrates, a Greek. But according to General Cunningham's reading of these inscriptions the name is considered to be that of the city or country to which the recorders of the inscriptions belonged.—*Cunningham Ancient Geog. of India, p.* 530.

XENOPHANES. See Nyaya.

XENOPHON, with ten thousand Greeks, conducted by the younger Cyrus, marched from Sardis to the neighbourhood of Babylon. The object of Cyrus was to place himself on the Persian throne in the place of his elder brother Artaxerxes Mnemon, but Cyrus fell at the battle of Kunaxa within six months of the commencement of the expedition. It set out in March or April 401 B. C., and after the death of Cyrus, they commenced their retreat; this occupied them one year, and in Oct. or Nov. 400 B. C., they recrossed the Bosphorus of Thrace to Byzantium. Their travels have been traced by Mr. Ainsworth. The ferries of rivers in India and the south of Asia are crossed in various ways, but on the Tigris and Euphrates, the upper Indus and its affluents, the practice of three thousand years still continues. Xenophon's ten thousand were ferried over on inflated skins, and three slabs in the British Museum show the representation of the king of Assyria crossing the Euphrates in this mode.

XERXES ii. B. C. 424. See Hindu, Kasra-i-shirin.

XIENG-MA, or Chang-mai, modes of spelling the Zimmay of the Laos. It is on the Menam river, between 19° and 22° N. L. Xieng-mai or Chieng-mai is the capital of Laos. It is built at the foot of a high mountain and contains 50,000 souls. Salt is much used in barter. The women are more laborious than the men. The Laos of the capital carry on trade with the province of Yunnan in China, on mules through forests and mountains, which require a month's journey. They employ elephants largely in war. See Laos.

XIMENIA AMERICANA. LINN.; *Roxb. W & A.*

Ximenia Russelliana. *Wall.*

Pen-lay-hsee,	BURM.	Nakkera,	TEL.
Konda nakkera	TEL.	Ura nakera,	"

This tree grows in the forests near the Godavery. Its fruit is used in medicine, and the powder of its yellow colored wood is used by the Coromandel brahmins in their religious ceremonials. The fruit resembles the flavour of the peach, as does the kernel of the nut. The leaves also smell like the common laurel, and probably contain prussicacid. In Masulipatam and Guntur the ryots distinguish two kinds—this and a small stunted kind, which grows in their fields, and which they say never attains a larger size. They use the bark medicinally for their cattle.—*Elliot, Beddome.*

XIMENIA ÆGYPTIACA. *Roxb.*

Balanites Ægyptiaca.

Peu Lay h'see,	BURM.	Hingen; Hingot,	HIND.

Grows in the Kotah district: the shell of the nut is used to make crackers in fireworks. Wight gives Ximenia olacioides, 1861.—*Gen. Med. Top. p.* 109.

XIMENIA RUSSELIANA. WALL. syn. of Ximenia Americana, *Linn.*

XING. See Chantaburi.

XIPHIAS GLADIUS, and X. platypterus, the Sword fish. Xiphias glaudias has been renowned since the times of Ælian and Pliny for its courage in attacking the whale, and even a ship; like the thunny and bonito, it is an inhabitant of the deeper seas, and, though known in the Mediterranean, is chiefly confined to the tropics. The dangerous weapon with which nature has equipped it is formed by the prolongation and intertexture of the bones of the upper jaw into an exceedingly compact cylindrical protuberance, somewhat flattened at the base, but tapering to a sharp point. In strange inconsistence with its possession of so formidable an armature, the general disposition of the sword-fish is represented to be gentle and inoffensive; yet the fact of its assaults upon the whale has been incontestably established. In the seas around Ceylon sword fishes sometimes attain to the length of twenty feet, and are distinguished by the unusual height of the dorsal fin. Those both of the Atlantic and Mediterranean possess this fin in its full proportions, only during the earlier stages of their growth. The Indian species are provided with two long and filamentous ventral fins and have been formed into the genus Histiophorus. Histiophorus immaculatus was previously known only by a single specimen captured in the Red Sea, by Ruppell, who conferred upon it the specific designation of "immaculatus."—*Tennent's Sketches of the Natural History of Ceylon, pp.* 328-330.

XIPHIDIUM. See Hæmodoraceæ.

XIPHILINE. See Polyandry.

XUDONIA. GR. Quince.

XULLA ISLANDS, four in number, are of considerable magnitude and height; the S. E. point of Xulla Bessey is in lat. 2° 28′ S. and long. 125° 58′ E., and is well inhabited and cultivated. See Papuans.

XYGOPHYLLUM SIMPLEX. LINN.

Gudhalanee,	SIND.	Putlanee,	SIND.

XYLO-ALOE. Eagle-wood.

XYLOBALSAMUM, a decoction or expressed juice of the young twigs of Balsamadendron Berryanum. An inferior quality of opobalsam is obtained from the fruit and twigs of the Amyris Gileadensis, that yields the superior quality. Xylobalsamum of the ancients is the wood of Balsamodendron gileadense, *Kunth.* M. Fee ascribes to B. Berryanum three distinct products; Balsam of Mecca, a wood called Xylobalsamum, and fruits termed Carpo-balsamum. Tradition is rich in anecdotes relative to the origin of this balsam; the mahomedans affirm that it sprung from the blood of the slain in Mahomed's conflict with the tribe of Harb, and that the prophet used the balsam for the resuscitation of the dead. It is much used in medicine by the hakims as a stimulant, tonic, and somewhat astringent remedy, and as an external application to indolent sores. It is also employed as a perfume and cosmetic.—*Faulkner; Fee.*

XYLOCARPUS. *Species.*

Ke-an-nan. BURM.

A tree of Tavoy, furnishing very durable timber. It seems to be the same as that described by Dr. Mason as growing on low land near the sea coast, and producing a red wood which turns black on being anointed with petroleum. It is much used for sandals, and canoes are occasionally made of it. This tree grows in Tavoy, is found very abundant all along the sea shore from Amherst to Mergui, and in the Mergui Archipelago. It is very common in the mangrove swamps. Its maximum length is 20 feet, and maximum girth 4 cubits, and when seasoned it floats in water. It is a very good, fine and strong wood, splits with difficulty. It is used by Burmese for all parts of houses, posts, flooring, walls, &c., and is recommended by Captain Dance for handspikes, helves, spokes and handles of tools, also for shot boxes and packing cases. Its inedible fruit, says Dr. Mason, is not like that of the Cocos de mer, but as the tree grows near the shore, the fruit falls into the sea, on which it floats.—*Dr. Mason, Captain Dance.*

XYLOCARPUS ECHINATUS ? ? ?

Ah Nan. Burm.

A tree of Moulmein, a very strong wood used for making gun stocks and sword scabbards.—*Cal. Cat. Ex.* 1862.

XYLOCARPUS GRANATUM. Kœn.

Carapa Moluccensis, *Lam.*		Granatum litoreum *Willde*	
Puroos, Pussoor,	Beng.	Penlay-oong,	Burm.
Pen-lay-pyoun,	Burm.	Sea cocoanut,	Eng.
Pen-lai-ung,	..	Madahul,	Malay.

The term xylcocarpus is from ξύλον, wood, and καρπός, fruit. This grows in the south of Ceylon, in the Sunderbuns, and in the forests of the delta of British Burmah ; wood used for house posts and musket stocks. A cubic foot weighs lbs. 47. In a full grown tree on good soil, the average length of trunk to the first branch is 20 feet,and average girth measured at 6 feet from the ground is 12 feet. Captain Dance also says its maximum girth is 4 cubits and maximum length 20 feet. Very abundant all along the sea shore from Amherst to Mergui. When seasoned it floats in water. It is used by the Burmese for all parts of houses, posts, flooring, walls, &c., is a very good, fine, strong wood, and splits with difficulty. Recommended for handspikes, helves, spokes, and handles of tools, also for shot boxes and packing-cases. Fruit ripens in June and July. The Carapa of Guiana was first described by Aublet. It yields fruits, the almonds of which are white, solid, oily, and bitter. The oil he described as being used by the Galebi savages to anoint their skins and hair, in order to keep off insects. This, the sea-cocoanut of Tenasserim, is not the famous Cocos de mer of the Seychelles, so long the wonder of the world ; but a tree very common in the mangrove swamps ; and growing near the shore, its fruit falls into the water andfloats out upon the sea, which gives rise to its name. The fruit is not edible, but is exceedingly astringent, and is regarded by the natives as a specific in cholera. The Xylocarpus is also mentioned as a tree with elegantly veined wood, used in India in cabinet work, and its bitter root is employed in bilious fevers. A starchy substance, used as an article of food, is also found beneath the bark of the capsule.—*O'Shaughnessy, p.* 246. *Drs. Mason. Brandis, Cal. Cat. Ex.* 1862, *Thwaites, p.* 16, *Captain Dance.*

XYLOCOPA LATIPES, a carpenter bee of Labuan.

XYLOCOPA TENUISCAPA. Westw.

Carpenter Bee. Eng. | X. latipes, *Drury.*

A hymenopterous insect, which perforates large beams of timber as also trees, by boring holes through them. On one occasion, at Kurnool in the Ceded Districts, one of them was seen to kill a sparrow by a single thrust of its sting. Any intruder within the precincts of their nests instantly becomes an object of suspicion and attack, and as the unlucky sparrow was flying towards the corner of the hospital, the bee assailed it, struck it with its sting, and the bird fell dead. On raising the skin from the bone, a small reddened spot on the fore part of the skull indicated the point at which the fatal weapon had entered.—*Drury. Tennent's Sketches of the Natural History of Ceylon, p.* 418.

XYLOPHYLLA ANGUSTIFOLIA, one of the small Euphorbiaceæ, shrubs growing to the height of three feet, the color of the flower is yellow and red.—*Riddell.*

XYLOPIA AROMATICA. Its fruit is the Piper Æthiopicum.

XYLOPIA PARVIFOLIA. *L. H. et T.*

Nattou, Singh.

A plant of the southern parts of Ceylon at no great elevation.—*Thwaites Enumeration Plantarum Zeylanica Part* i. *p.* 9.

XYLOTRECHUS QUADRIPES. *Chevrolat.* The large and rapid introduction of coffee growing into Ceylon and India, has shown that the plant is liable to be attacked by many enemies, and ignorance of that has been the cause of much loss. Coffee trees in Coorg have also been injured by the rot, a disease resulting from improper pruning. The rot attacks and decays the centre of the stem. In Coorg, when the tree is attacked by the borer the leaves became yellow and droop. The insects are generally about the diameter of a small quill, are always confined to the wood, and never enter the bark until the larva has done its work, passed through the pupa stage, and is about to escape in the form of a beetle. The eggs are deposited by the females near the root of the tree, and the pupa bores a tunnel up the heart of the plant. In the peninsula of India, Borer is a name given to the larvæ of certain coleopterous beetles, which injure coffee trees. There are two, the white and red borer, and the chief of these is the X. quadripes.—*Dr. Bidie on Coffee Planting.* See Coffee.

XYPHOSUR, so called from the long sword-like tail.

XYRIDACEÆ. Lindl., an order of plants with 1 Gen. 6 sp. of Xyris in the E. Indies.

XYRIS INDICA. Linn.

Dali doob, Beng. | Kotsjelliti pullu, Mal.

A plant of China and India, a species of Xyris with conspicuous yellow flowers on imbricated scaly heads, often seen in the Tenasserim paddy fields. It is said by Agardh to be used as a remedy in itch and leprosy.—*Mason.*

Y

Y is the twenty-fifth letter of the English alphabet ; it derives its form from the Greek Y, hence it is called in Spanish and French the Greek I. At the beginning of words and syllables it is a consonantal element ; in the middle and end of words it is a vowel, being precisely the same sound as i. It is sounded as i long when accented, as in defy, rely ; and as i short when unaccented, as in vanity, glory, synonymous. In a great number of English words derived from the Saxon, the Saxon letter g has become y, as gear into year ; daeg into day ; gealew into yellow ; in Bengali, when uncompounded, its power is that of j, the reverse of the sound in the German alphabet, where j has the sound of y.

YABAGARE. Turki, a woody shrub growing at the snow limit, N. of Karakoram.

YABIS. Hind. Hyssopus officinalis.

YABISAT-I-KARUH, in Persian medicine, Epulotica.

YABOO, a small horse of the mountains near Kabul.

YABRUZ. Pers. Atropa maudragora, *Linn.*

YACUT. Arab. Ruby.

YADALA, also Bandi kattu tige, Tel. Combretum ovalifolium, *Roxb.*

YADASANG-PATI. Sans. from yadas, a water animal, and pati, lord.

YADAVA. Sansc. Jadon. Hind. a descendant of Yadu : also a tribe of Rajput landlords and cultivators dwelling in considerable numbers about Agra and Mathura, in the Central Doab and in eastern Malwa. The raja of Karouli is of this tribe ; they profess to be descendants of Krishna. Some of their subdivisions are held in little esteem, and are termed Bagri by their neighbours ; but they are spirited farmers and rising in wealth and consideration.—*Wilson Glossary.*

YADDU METTE. or Eddu-matta chettu. Tel. Nelsonia tomentosa, *Dietr.*

YADNUPAVITA. The zonar or poitu.

YADU, a race some of whose branches have taken a prominent part in the history of Central Asia, in the valley of the Indus, in the countries now styled the Punjab, Rajputanah and Sind'h, known in ancient times as the Gete, the Yuti, and now represented by the Jat, Jut, Jet or J'hut, and by the Yadu Bhatti of Jessulmir, all dwelling along the valley of the Indus and to the east in Rajputanah. A multiplicity of scattered facts and geographical distinctions fully warrant the belief that the Yadu race had dominion in Central Asia, and were again, as mahomedans advanced, repelled upon India. Budh was an ancestor of a branch of the great hindu people, of a time prior to authentic history. He is traced up to Brahma, from whom he descends through Atri, Samudra, Chandra or Soma, and Vrihaspati. Budh is said to have married Ila, daughter of Ikshwaku, with whom; therefore, he was a contemporary, and the descendants of this union were, in succession, Pururava, Ayu or Yaou ; Nohas or Nohus, and Yayat. Ayu or Yaou is claimed by the Tartar and Chinese genealogists as their great progenitor : from Yayat sprung three great lines, the Yadu, Puru and Oora or Oorvasa, from each of whom came many dynasties ruling on the Indus, in Hindustan, Assam, Ava and China. The great Hya was a branch of the Yadu, and five members of it formed Panchalika or Panchaldesa, and the seed of Bajeswa at one time occupied all the countries on the Indus. Of the three lines, the Yadu, Puru and Oora, the Yadu became the most illustrious. The descendants of Budh and Ila were known as the Chandravansa, Somavansa, and Induvansa, all of these terms meaning the Lunar race ; but the fame of the Yadu eclipsed the prior designations, and throughout India the Lunar race came to be styled Yaduvansa. The Yadu held territories in Hindustan about Allahabad, but seemingly in small republican states, some of which were staked and lost at play. The relatives then fought for dominion, for eighteen days, on the field of Kuru Khet. There was no battle of armies, but a series of single combats with treacherous, cruel, surprises, during which nearly all of the Yadu fell, and at the close, of those remaining, several, amongst whom Krishna was one, emigrated. The story is told in the Mahabharata. After the combats, the Yadu seem to have left the Ganges, to have been expelled from Dwarica, to have crossed the Indus, passed Zabulisthan and founded Ghuzni and Samarcand, but to have swept back on the Indus into Guzerat and the Indian desert from which they expelled the Langaha, Johya, Mohila, &c. and founded successfully Tannote, Derrawul and Jessulmir, in S. 1212, the present capital of the Bhatti, the lineal successors of Krishna. They are now known as the Bhatti of Jessulmir, the Jharijah of Cutch Bhooj, the tribes occupying Kerouli and Subbulghur on the Chumbul, and the Sumaitcha on the Chumbul. The great Tuar tribe are also said to have been of Yadu origin. The Bhatti and Jharijah trace their descent from Budh and Krishna, and they may be said to occupy the Indian desert from the Sutlej to the ocean. Budh seems to have been a descendant of the first man, Brahma, and to have been the first emigrant from Saca-dwipa or Scythia, into Hindustan, viz. : about B. C. 2400. Between Budh and Krishna was a period of 1200 years. But Bud'h was deified by his descendants, and in hindu mythology he is described as of Lunar origin, the son of Soma or Chandra or Indu, the moon, by Rohini. The date of the apotheosis of Budh is not known. There seem to have been fifty-six clans of the Indu or Lunar race.

The Yadu was at one time the most illustrious of all the tribes of India, and became the patronymic of the descendants of Budh, progenitor of the Lunar or Indu race. Yudishtra and Baladeva, on the death of Krishna and their expulsion from Dehli and Dwarica, the last stronghold of their power, retired by Mooltan across the Indus. The two first are abandoned by tradition ; but the sons of Krishna, who accompanied them, after an intermediate halt in the further Doab of the five rivers, in the cluster of hills still called Yadu-ca-dang, "the Yadu hills"—the Joude of Rennell's geography, they eventually left the Indus behind, and passed into Zabulisthan, formed Ghuzni, and peopled these countries, even to Samarcand.

The annals of the Bhatti of Jessulmir, which give this early history of their founder, mix up in a confused manner the cause of their being again driven back into India ; so that it is impossible to say whether it was owing to the Greek princes who ruled all these countries for a century after Alexander, or to the rise of mahomedanism. But, driven back on the Indus, they obtained possession of the Punjab and founded Salbahanpoor. Thence expelled, they retired, as above related, across the Sutlej and Garah into the Indian deserts ; whence expelling the Langaha, the Johya, Mohila, &c., they founded successively Tannote, Derrawal, and Jessulmir, in S. 1212, the present capital of the Bhatti, the lineal successors of Krishna. Bhatti was the exile from Zabulisthan, and as usual with the Rajpoot races on any such event in their annals, his name set aside the more ancient patronymic Yadu. The Bhatti subdued all the tracts south of the Garah, but their power has been greatly circumscribed since the arrival of the Rahtore. The Jharijah is the most important tribe of the Yadu race next to the Bhatti. Its history is similar. Descended from Krishna, and migrating simultaneously with the remains of the Hericula, there is the strongest ground for believing that their range was not so wide as that of the elder branch, but they settled themselves in the valley of the Indus, more especially on the west shore in Sewisthan ; and in nominal and armorial distinctions even in Alexander's time, they retained the marks of their ancestry. The place where they found refuge was in the cluster of hills still called Yadu-ca-dang, 'the Yadu hills :'—the Joude of Rennell's geography.

The most common epithet of Krishna, or Heri, was Shama or Sama, from his dark complexion. Hence the Jharijah bore it as a patronymic, and the whole race were Sama-pootia (children of Sama), whence the titular name Sambus of its princes. The modern Jharijah, who from circumstances has so mixed with the mahomedans of Sind as to have forfeited all pretensions to purity of blood, partly in ignorance and partly to cover disgrace, say that the origin is from Sham, or Syria, and of the stock of the Persian Jamsheed : consequently, Sam has been converted into Jam ; which epithet designates one of the Jharijah petty governments, the Jam Raj. The Bhatti and the Jharijah are the most conspicuous of the Yadu race ; but there are others who still bear the original title, of which the head is the prince of the petty state of Kerowli on the Chumbul. This portion of the Yadu stock would appear never to have strayed far beyond the ancient limits of the Suraseni, the Suraseni of Vrij, the tract so named, thirty miles around Mat'hura, their ancestral abode. They held the celebrated Biana ; whence expelled, they established Kerowli west, and Subbulgurh east, of the Chumbul. The tract under the latter, called Yaduvati, has been wrested from the family by Sindia. Sri Mat'hura is an independent fief of Kerowli, held by a junior branch.

The Yadu, or as pronounced in the dialects, Jadoon, are scattered over India, and many chiefs of consequence amongst the Mahrattas are of this tribe. There are eight sacha of the Yadu race, four of whom are :—

Yadu ...	...Chief, Kerowli.
Bhatti ...	...Chief, Jessulmir.
Jharijah ...	...Chief, Cutch Bhooj.
Sumaitcha...	...Mahomedans in Sind.

The Tuar, though acknowledged as a subdivision of the Yadu, is placed by the best genealogists as one of the 'thirty-six,' a rank to which its celebrity justly entitles it. We have in almost every case the etymon of each celebrated race, but for the Tuar there is none; and we must rest satisfied in delivering the dictum of the Bardai, who declares it of Pandu origin. The Yadu race followed the faith of Budha or Jaina; in fact, Nemnath, or familiarly, Nemi (from his dark colour called Arishta Nemi), was of the Yadu race, not only the contemporary, but the very near kinsman of Krishna, they both being the sons of Basdeo and Samadru, the elder and younger of ten brothers. Colonel Tod supposes the Yadu to have been all originally budhist, and of Indo-Getic origin, as their habits of polyandrism alone would almost demonstrate; and as the best informed of the Jain sect assure us that Nemnath, the twenty-second Budha, was not only a Yadu, but the near kinsman of Krishna. He regards the Yadu to be the Yu-te, or ancient Gete of the Jaxartes, amongst whom, according to Professor Neumann, from Chinese authorities, one of the Shamanean sages sprung, eight hundered years before Christ. The Yadu is undoubtedly one of the chief of the races of Indu, or Chandra, 'the moon', and the term Nemeswar probably means the founder of this race; from Nema, foundation, and iswara, 'lord.' The traditions of the Jit claim the regions west of the Indus as the cradle of the race, and make them of Yadu extraction; thus corroborating the annals of the Yadu, which relate their migration from Zabulisthan. The Yadu of Jessulmir, who ruled Zabulisthan and founded Guzni, claim the Chagitai as of their own Indu stock, a claim which Colonel Tod deems worthy of credit.—*Tod's Rajasthan, vol.* i. *p.* 85.

YADU BHATTI. This race is supposed to be the original Yuti colony from Central Asia. See Aharwarrah, Bactria, India, Khengar, Krishna, Jessulmir, Mysore, Yadu.

YADVA. See Krishna, Yadava, Yadu.

YÆ-HING-KHYAN-THA. Burm. One of the Cinchonaceæ.

YÆ-KHA-OUNG. Burm. Ficus dæmonum *Kon. Roxb.*

YÆ-PA-DAING. Burm. Herbertianum, *Wall.*

YÆ-THA-PAN. Burm. Ficus glomerata, *Roxb. Willde.*

YAFFA. A district of Yemen, surrounded by those of Lahej, Sanaa and the Hadramaut provinces, and reaching inland to the Jabal Yaffai mountains 6,500 feet above the sea level. The Yaffai tribe is the most powerful in Yemen.

YAFFAI, a native of Yaffa.

YAG. See Kunawur.

YAGA, a burnt-offering, formerly made on grand scale by kings. See Yagna.

YAGASL. Tel. See Peah Saul.

YAGHI. Turk., rebellious, a term applied to such chiefs as refuse their obedience and homage to government, even though they accompany this refusal with no violent act of rebellion. It is best rendered, perhaps, by the English word refractory. It is the corruption of the Arabic word baghi.—*Fraser's Journey into Khorasan, p.* 45.

YAGINE. Burm. Rottlera, species.

YAGNA. Sans. from yaja, worship of burnt sacrifices. See Yaga.

YAGNAHA. Sans. from yagna, a sacrifice, and han, to destroy.

YAGNA VARMA. See Inscriptions.

YAHIA. See Abdul Latif.

YAHSAB. See Saba.

YA-HUD, or Yahudi. Ar. Jews.

YAIBANE, in the teak forests of Pegu, are the Yaibane, manufacturers of silk, who cultivate the mulberry tree, Morus Indicus, for feeding silk-worms which they rear, the hills being better adapted for the growth of the plant than the plains, besides which their plantations are not exposed to the trespass of cattle. The silk they produce appears to be of a coarse kind, more owing to the imperfect way in which it is wound off than to any fault of the cocoon. They are a most industrious people, young and old of both sexes being employed without interruption in some part of the process, which seems to require incessant attention. The cocoons seemed to be large and very fine, and were produced at the rate of 2,000 for one rupee, and the silk when wound off is valued at five rupees per viss. They could give no information about the teak forests, though living in the midst of them. A few men come up from the plains at certain seasons to cut and remove timber, but beyond this they knew nothing, and seemed to care still less about the matter. The Yaibane are however a very happy and prosperous race, with the reputation of being possessed of considerable hidden wealth, which for security they bury in the forest.—*Selec. Records Government of India, Foreign Dept. No.* ix. *p.* 13.

YAJNAVALKYA. See Mitakshara.

YAJNA VARMA. See Inscriptions.

YAJNIKA. See Inscriptions.

YAJNO-PAVITA. Sans. The Zonar.

YAJUR. Sans. The name of one of the Vedas, religious books of the hindoos. The Taittiriya, or the black Yajur-Veda, contains more of prayers to serpents and serpent worship than the Rig-Veda. In the sanhita of this veda are prayers to the sarpa who are addressed as inhabiting the heavens, the skies, the rays of the sun, the waters, the vegetables, &c. See Arian, Brahmadica, Inscription, Hindoo, Veda, Vidya.

YAK. Bos grunniens.

Ya-niu. CHIN. | Yakmo, the female, TIB.
Yak, the male, TIB. |

Vigne was informed that the yak is found wild on the northern slopes of the Himalaya, where they descend on Yarkand. In the Western Himalayas, the wild yak is called Brong or Dong, and the female hBrong-hBri, which is commonly pronounced Dond-di. Its existence is commonly believed in by the Tibetans in Ladak, who say it inhabits the grassy plains on the upper courses of the Sutlej and Sangpo, on the northern slopes of the Himalaya that descend upon the plains of Yarkand, and in the district of Gnari, north and north east of Garo. But none of the recent travellers, Vigne, Wood, or the brothers Cunningham, have seen one. The Messrs. Schlagentweit state that in western Tibet, particularly in Ladak, there are no more of the yak in a wild state at present, though they have no doubt that they have formerly existed there. They seem to have been extirpated there, the population being, though very thin, a little more numerous than in Tibet in general. As Ladak has been more visited by travellers than any other part of Tibet, the want of the yak here has probably given rise to the idea that they are no more to be found in a wild state at all. Amongst all quadruped animals the yak is found at the greatest height; it stands best the cold of the Snowy Mountains, and is least affected by the rarefied air. But at the same time, the range of temperature in which a yak can live is very limited, the real yak can scarcely exist in summer at heights of 8000 feet. They often found large herds of wild yak, from thirty to forty, on heights of 18,600 to 18,900 English feet; and on one occasion they traced them even as high as 19,300 feet—a remarkable elevation, as it is very considerably above the limits of vegetation, and even more than 1,000 feet above the snow line. Hermann and Robert Schlagentweit frequently found wild yak on both sides of the range which separates the Indus from the Sutlej, near the origin of the Indus and near the environs of Gaarto, but the greatest number of them was at the foot of the Karakoram range, as well as at the foot of the Kuen-Luen in Turkestan. The wild yak or bison (D'hong) of Central Asia, the superb progenitor of the domestic yak, is the largest native animal of Tibet, in various parts of which country it is found. It is untameable and horridly fierce, falling on the hunter with horns and chest, and if he rasp with his tongue it is so rough as to scrape the flesh from the bones. It is hunted by large dogs, and shot with a blunderbuss; the horn is used as a drinking cup in marriage feasts and on other grand occasions. The wild yak does not come so far south as Rupshu, but a few are met with during winter and early spring on the Nubra ranges; they migrate, however to the loftier slopes of the Karakoram before the end of April. The yak wanders about singly or in small herds, preferring secluded valleys to open hill-sides, passing the day among the snow, where, like deer and bears, it may often be seen at mid-day stretched out at full length asleep. Captain Peyton's collection contained an entire skeleton and a few magnificent heads, procured by himself. The horn of the largest measured 2 feet 4½ inches round the curve, 1 foot in its greatest circumference, and between the tips 1 foot 8 inches. Dr. Adams learned however, that much larger measurements are recorded. The prevailing colour of the wild yak is black, with a grayish tinge on the head. In its native state it is shy and timid, and the same to some degree when domesticated. The tame yak now takes the place of its half bred, called zho. The yak is the chief beast of burden in Rupshoo, and furnishes the Tartars with nearly all their wants. The tame domestic yak is often handsome, and a true bison in appearance. It is invaluable to the mountaineers of Northern India from its strength and hardiness, accomplishing at a slow pace 20 miles a day, bearing either two bags of salt or rice, or four to six planks of pine wood slung in pairs along either flank. Their ears are generally pierced and ornamented with a tuft of scarlet worsted; they have large and beautiful eyes, long silky black hair, and bushy tails: black is their prevailing colour, but red, dun, party coloured and white are common. In winter flocks graze below 8000 feet, on account of the great quantity of snow above that height; in summer they find pasturage as high as 17,000 feet, consisting of grass and small tufted carices, on which they browse with avidity. Much of the wealth of the people in East Nepal consists in its rich milk curd, eaten either fresh or dried, or powdered into a kind of meal. The hair is spun into ropes and woven into a covering for their tents, which is quite pervious to wind and rain, though in the dry climate of Tibet this is of little consequence. The bushy tail forms the well known chowree or fly flapper of the plains of India, and its hair is greatly esteemed by the women of the plains to add to their back hair. The female drops one calf in April, and the young yak are very full of gambols, tearing up and down the steep grassy and rocky slopes. Their flesh is delicious, much richer and more juicy than common meat; that of the older yak is sliced and dried in the sun, to form jerked meat, called schat-t-chew, dried meat, which is eaten raw, and is a palatable food. The yak loves steep places, delighting to scramble among rocks, and to sun its black hide perched on the glacial boulders which strew the Wallanchoo flat, and on which these animals always sleep. Their average value is from two to three pounds. The yak, though indifferent to ice and snow, cannot endure hunger so long as the sheep. Neither can it bear damp heat. The yak is ridden and its pace is easy. Yak are bred in Busahir, whence they are sent for sale.

In Spiti the yak is a highly useful animal —with it the people plough, and carry loads; it furnishes also milk, and hair to make ropes. In the severest weather this animal appears to enjoy itself in the snow, and is often to be seen with icicles of several inches in length hanging to its nose, and a foot or more of ice hanging to the hair which falls from its neck and shoulders. Long hairs hang over the eyes and prevent their freezing. The total number of yaks in Spiti is 439, and of jubboo or half-yak and cows, 412; they have also the ghoont, asses, sheep, goats, dogs and cats. The Tibetan Dzo, called Chubu in the Himalaya, also zho and zo, is a mixed breed or hybrid from the bull yak or Bos grunniens, and the common Indian cow, the Zebu. In some valleys, their numbers exceed those of the pure yak. The hybrid between the yak and the Indian cow is very fertile. They are most useful domestic animals to the inhabitants of the Himalaya, are brought down to lower places, where yaks do not exist, and where consequently they cannot mix either with yaks or with the Indian cow. The Brothers Schlagentweit had occasion to see and examine the offspring of the hybrid as far as to the seventh generation, neither much altered nor deteriorated; and were informed that there was never found any limit as to the number of generations.—*Dr. Adams. Vigne's Travels. Cunningham's Ladak. Dr. Hook. Him. Journ. Schlagentweit.*

YA-KA-NGI-NE. BURM. A tree of Moulmein, wood used in ordinary house building.—*Cal. Cat. Ex.* 1862.

YAKAULEY. TAM. ? a Tinnevelly timber of a light brown colour, used for building purposes.—*Col. Frith.*

YAKKA, a race formerly occupying the interior of Ceylon. The Yakka, previous to the arrival of Gautama, were demon-worshipers; neither was their conversion general.—*Forbes' Eleven Years in Ceylon vol.* ii. *p* 82.

YAKONIN, in Japan, generally an officer with two swords, but known to the foreigners as, or supposed by them to be, a government officer of the police or custom-house. A yakonin is understood, in fact, to represent a paid officer of the Japanese government.—*Hodgson's Nangasaki, p.* 21.

YAKSHA, in hindoo mythology, is a kind of demi-god attendant on Kuvera, the god of wealth, and employed by him in the care of his gardens, &c., situated on mount Kailasa. The Yaksha demi-gods were supposed to be much courted by the Apsarasa or nymphs of Indra's heaven, but that they had wives of their own is clear from the Meghaduta. Their name is said to be derived from Yaksha to worship, either because they worship Kuvera, or are themselves worshipped by men.—*Williams' Story of Nala, p.* 203.

YAKSHADUPHA. SANS. Dammer.

YAKUT. AR. HIND. MALAY. a ruby. Yakut rumani, a first class ruby.

YAKUT. See Shaman.

YALLO. See Kazzilbash.

YALUM. MALEAL. Elettaria cardamomum, *Maton.*

YAM. ENG.

Kan-chu	CHIN.	Chu-yu	CHIN.

Colocasia antiquorum, *Schott.*, and several other species of Colocasia, of the Araceæ or Arum tribe of plants; of these there occur in India C. cucullata; C. esculenta, C. fornicata, C. indica, C. odora, C. nymphœifolium, also Arum lyratum, and species of Dioscorea. The different species of yams have a wide range. In the West Indies there are several varieties, having distinctive names, according to quality, color, &c., as the white yam, the red yam, the negro yam, the creole yam, the afoo yam, the buck yam, Dioscorea triphylla, which is found wild in Java and the East; the Guinea yam, the Portuguese yam, the water yam, and the Indian yam, &c. The last is considered the most farinaceous and delicate in its texture, resembling in size the potato: most of the other sorts are coarse, but still very nutritive and useful. The common yam, Dioscorea sativa, is indigenous to the Eastern Islands and West Indies. The Guinea yam, D. aculeata, is a native of the East. The Barbadoes or winged yam, D. alata ? has a widely extended range, being common to India, Java, and Brazil. The yam species are climbing plants, with handsome foliage, of the simplest culture, they succeed well in any light, rich, or sandy soil, and are readily increased by dividing the tuberous roots. The Indian, Barbadoes, and red yams are planted in the West Indies early in May, and dug early in the January following. If not bruised, they will keep well packed in ashes, the first nine, and the second and last twelve months. The Portuguese and Guinea yams are planted early in January and dug in September. Creole yams and Tanias are dug in January. Sweet potatoes from January to March. In most tropical countries large crops of the finest descriptions of yams, cocos, &c., could be obtained, but the planting of ground provisions is much neglected. From the tubers of yams of all sorts, and particularly the buck yam, starch is easily prepared and of excellent quality, some varieties of the buck yam are purple fleshed, often of a very deep tint, approaching to black, and although this is an objection, because it renders more washing necessary, yet even from these the starch is at last obtained perfectly white ; the buck yam, especially when grown in a light soil, is equal to the potato, if not superior to it. It does not, however, keep for any length of time, and therefore could not be exported. Yams and sweet potatoes thrive well in the northern parts of Australia ; indeed the former are indigenous there, and constitute the chief article of vegetable food used by the natives. The yam was introduced into Sweden, where it succeeded well, and bread, starch and brandy were made from it, but it prefers a warmer climate. When cooked either by roasting or boiling, the root is nutritious, and possessed of a flavor between that of rice and the potato. Dressed in milk, or mashed, they are a delicacy. The yam frequently grows to the enormous size of forty or fifty pounds weight, but in this large state it is coarse flavored and fibrous. An acre of land is capable of producing 4½ tons of yams, and the same quantity of sweet potatoes, within the twelve months, or nine tons per acre for both, being nearly as much as the return obtained at home in the cultivation of potatoes. The kidney rooted yam, Dioscorea pentaphylla, is indigenous to the Polynesian islands, and is sometimes cultivated for its roots. It is called Kawan in the Fiji islands. D. bulbifera, a native of the Archipelago, is also abundantly naturalised in the Polynesian islands, but is not considered edible. There are seven or eight kinds of yams grown in India ; D. sativa grows in Ceylon, and D. batatas in China. Two kinds found in the Tartar country are of a remarkable fine flavour, one weighing as much as eighteen pounds, the other three pounds. In the Fiji islands, some of the yams, of which there are upwards of 50 varieties, grow to the enormous size of 50 to 80 lbs. in weight. Their general average however is from 2 to 8 lbs. Captain Hill states that the New Zealand yam if boiled, are heavy and wet, cut into slices after boiling and then fried with a little butter nearly dry decidedly good, not exactly mealy, but nearly so.—*Smith's Mat. Med. Roxb. Flor. Indica. Voigt. Hort. Calc. Simmond's Comml. Products, p.* 363, 4.

YAM. Chin. a post house. In the time of the embassy sent by Shah Rukh, every yam was situated opposite to a city or town, and in the intervals between the yam were many kargu and kidifu. The word kargu is applied to a tower of some sixty cubits in height, where two men are constantly on duty. The tower was so placed that the next kargu is in sight from it, and when any event of importance occurs, like the approach of an enemy's army, the men on watch immediately lighted a fire, and this being seen from the next kargu, they make haste to light another. A double system of horse and foot posts was also found by Ibn Batuta, established in India in A. D. 1333. The posts of Timur are noticed by Clavijo (p. 105), and Baber describes his own post between Agra and Cabul, using the word yam, but adding that it was called in India dak-choki, the term in use in all India to this day. Pautheir thinks yam to have been taken from the Chinese yi-ma, "horse-post." Burnes was told of the continued existence of both post and fire beacons between Yarkand and Pekin. The distance is more than five months journey as usually travelled, but an express went in thirty-five days, and under very great emergency in fifteen.—*Marc. Pol. p.* 335 *Erskine's Baber, p.* 393. *Yule Cathay,* i. *pp.* 138, 159.

YAMA. Sans, he who is free from the influence of the passions.

YAMA, in hindoo mythology, the king of death and hell, and regent of the south. Yama, or Dharmarajah, resembles both the Grecian Pluto, the king of hell, and Minos, the judge of departed souls, and in hindoo mythology he is the regent of the south, or lower division of the world, mythologically called Patala, or the infernal regions. Yama is described as of a green colour, with red garments, having a crown on his head, his eyes inflamed, and sitting on a buffalo, with a club and pasha in his hands. "His dreadful teeth, grim aspect, and terrible shape," says Mr. Ward, "fill the inhabitants of three worlds with terror." As Dharmarajah he is described as of a divine countenance, mild and benevolent. The virtuous only see the latter: the wicked are judged by Yama, surrounded by all his terrors. If the dead have been virtuous, they ascend to a place of happiness; if wicked, they are sent to a particular hell, to undergo the punishment appointed for their especial crimes. Yama is called Srad'ha deva, or lord of the obsequies, and presides over the ceremonies of Srad'ha. At the time of offering the oblations to the manes of deceased ancestors, he is invoked by the priest under several names, of which Mr. Colebrooke has enumerated fourteen. The priest thus addresses him. Salutation to Yama, salutation to Dharma Rajah, or the king of the Deities, to Antaka, the Destroyer! to Vaiwaswata, or the Child of the Sun! to Kala, Time! to the Slayer of all Beings! to Andhambara or Yama, &c. &c. The hindus make daily oblations of water to Yama. The second day of the month Kartica is sacred to him and his sister, the river goddess, Yamana or Jumna, who entertained him on that day; in consequence of which an annual festival is held, in which sisters entertain their brothers. On this occasion an image of him of clay is made and worshipped, and then thrown into the river. He is also worshipped on the fourteenth day of the dark part of the month Aswina. Some of the other names of Yama are Pitripati, or lord of the Pitri; Andhambara, from a wood from which fire is produced by attrition; and Dandadhara, he who has the rod of punishment. The name of Yama occurs frequently in the sacrificial ceremonies of the hindoos; oblations and invocations to him forming a portion of several of those ceremonies. Minos of the Greeks has been supposed the same with Menu; with whom, especially with the seventh, Satyavrata, Yama also agrees in character, as well as in name; both being called Vaivaswata, or offspring of the sun, and Srad'ha deva, or lord of the Srad'ha. Srad'ha is the ceremonial oblation in honour of deceased ancestors, which obsequies to the dii manes are attended with feasting, and various observances. Mr. Wilford believes Yama, or Pluto, to be the same with Serapis; deriving the latter name from a compound Sanskrit word implying thirst of blood. The sun, in Bhadra, had the title of Yama; but the Egyptians gave that of Pluto, says Porphyry, to the great luminary near the winter solstice. Yama, the regent of hell, according to the Puranas, has two dogs; one of them named Cerbura, or varied; the other, Syama, or black: the first is also called Trisiras, or with three heads; and has several other epithets, signifying stained, or spotted: Cerbura is indubitably the Cerberus of the Greeks. The dragon of Serapis is supposed to be the Seshnaga, which is described as in the infernal regions by the author of the Bhagavat. "A dying hindoo, when no hopes of his surviving remain, should be laid on a bed of Kusa grass (Poa cynosuroides) in the open air, his head sprinkled with water drawn from the Ganges, and smeared with clay brought from the same river. A salagrama stone should be placed near him, holy strains from the Veda should be chanted aloud, and leaves of holy basil scattered over his head. Yama, as the god of justice, presides over the different Naraka or hells. He is son of Surya, the sun. As the judge of departed souls he is identified with death. His abode is in the infernal city of Yampura, whither the hindus believe that a departed soul repairs, and receiving a just sentence from Yama, ascends to Swarga or descends to Naraka, or assumes on earth the form of some animal according to its deserts. Yama rides upon a buffalo as his vahan and is armed with a ponderous mace.—*As. Res. vol.* iii. *p.* 409, *Moor, pages* 309 & 310. *William's Story of Nala, p.* 205. *Hind. Theat. vol.* ii. *p.* 62. See Dharmaraja, Hindoo, Indra, Inscriptions, Osiris, Pandu, Sani, Saraswati, Sati, Siva, Vahan.

YAMADAUSHTRA. SANSC. Literally Yama's teeth, the last 8 days of Aswin and the whole of Kartik, considered a period of general sickness.

YAMA-DULA. Yama's messengers.

YAMAGHIKHA. HIND. Taraxacum officinalis.

YAMALAYA. SANS. From yama, and alaya, a dwelling.

YAMA-LOCUM. The distance from the world to the Yama-locum is 99,000 yojna, or 14,85,000 miles. See Hindu or Hindoo.

YA-MANA. See Inscriptions.

YAMANA. BURM. Gmelina arborea, *Roxb.*

YA-MA-NE. BURM. A tree on the Tennasserim hills, which furnishes a remarkably light, white timber, resembling mootchee wood, of which the natives often make canoes. The Karen say it bears a yellow flower, and a small plum, which is a favorite food with the barking deer.—*Dr. Mason.* See Yemmanee.

YAMANI. BURM. A Moulmein tree, wood used in ordinary house building.—*Cal. Cat. Ex.* 1862.

YAMA-RAJ. SANS. From yama, and raj.

YAMBRE, also called Kuru, silver ingots used in trade in Central Asia.—*Caley.*

YAMDAL. HIND. of Kanawar, Taxus baccata. Common yew.

YAMMALU. The chief divinity of the Fenn, a Scythic race.—*Pinkerton's History of the Goths, vol.* ii. *p.* 215.

YAMMANDY. BURM., a useful and valuable wood in Amherst, used for carving images and making drums.—*Cat. Ex.* 1851.

YAMNI or Sang-i-yamani. HIND., an agate.

YAMOOD, a Turkoman race settled beyond the river Attrak, near the shores of the Caspian Sea, and between this and Khiva, consisting of 25,000 families. They are the least ugly of the Turkoman tribes. The Goklan, on the banks of the Goorghan and the Attrak, between Astrabad and the Attrak, consist of 12,000 families.

The Tekie, who are separated from the Kurd by a chain of mountains which extend from the sources of the Goorghan and the Attrak near Sharaks, consist of 35,000 families. They wander between the sources of the Attrak and the town of Merv.

The Turkoman's principal occupation consists in making chapao, or raids, upon the Persians.

YAMUN is generally called "offices" of the mandarins.—*Meadow's Desultory Notes, p.* 101. Gaman, Kwang-tung-chi.

YAMUNA-BHRATA. SANS. From yamuna, a river, and bhrata, a brother.

YAMUNA or Jamna river of Hindustan, in hindu mythology, is personified as the daughter of Surya or the sun, and sister of Yama. To Yama, who is "the son of the sun," the second day following the Amavus, or ides of Cartica, is also sacred; it is called the Bhratri divitya, or 'the brothers,' because the river goddess Yamuna on this day entertained her brother (bhratri) Yama, and is therefore consecrated to fraternal affection. At the hour of curfew, gaodaluk, when the cattle return from the fields, the cow is worshipped, the herd having been previously tended. From this ceremony no rank is exempted on the preceding day dedicated to Krishna: prince and peasant, all become pastoral attendants on the cow, as the form of Prithivi, or the earth. The Bhagavata relates that Krishna's mortal parents were Vasudeva (meaning the giver of wealth) and Devaki, mentions a miraculous escape of the infant over the Yamuna conveyed by his father, and protected by Sesha, or immortality, the guards placed by Kansa over his pregnant sister having failed in their vigilance. Kansa, enraged, ordered all newly-born infants to be slain; but Krishna escaped his various snares, one of which was sending a woman, named Patnia, with a poisoned nipple, to nurse him, and he was fostered by an honest herdsman, named Ananda, or Happy. See Brahminicide, Hindu, Inscriptions, Krishna, Kala-Priyanath, Triveni.

YANADI, a race who dwell in the forests of the Striharikottah muttah of the Chingleput collectorate. They are in a low state of civilization, and hold little or no intercourse with their more civilized neighbours. Until recently, their ordinary avocations were the gathering of the wild products of the forests which the officers of Government bought from them at rates lower than the ordinary market prices, and paid them in kind, with grain, and clothes. Latterly, however, a few on the outskirts have taken to charcoal burning and wood-felling, and they are now also paid partly in money, changes which all bring them more in contact with settled people around them. An effort was made in 1855, to induce them to engage in agriculture, but neither that nor subsequent attempts to persuade them to rear cattle and sheep have succeeded. In 1857, Government established a school for their children, and forty to fifty scholars were lately in attendance, for each of whom an allowance in grain is given. The use of money has compelled them to a small extent to engage in the ways of ordinary life, but they are considered to be still insufficiently civilized, to be left without the aid and protection of Government. The sum paid to them is about Rupees 1,800 a year. The Yanadi are about 500 in number. Some who reside on the outskirts of the forests come a little more in contact with the every day world; but their ordinary locality is in the very depths of the forests, beneath the shade of pending branches, and only about ten or twelve families have huts made of branches of trees. In stature they are smaller than the hindu people around them. A few are of a dark bamboo colour, but ordinarily they are black. The men are not good looking but the women are positively ugly, though decently clad. The men wear only the langoti. They have clear skins, but are largely troubled with elephantiasis, for they suffer much from fever. They seem to use warm earth baths in fever. Their food consists of wild fruits and roots, particularly those of the Kanduri, HIND. (Bryonia grandis, *Linn.*) a few wild varieties of yams, and the leaves of Capparis horrida, rice, the wild bean, Canavalia virosa, molluscs, fish and flesh of every kind. They hunt with the bow and fish by torch light. They are polygamists, have up to four or even seven children. They bury or burn their dead, and pour libations on the grave. The men average 5 ft. 4⅜ in. in height and lbs. 100 in weight. The women average 4 ft. 6 in. in height and lbs. 82 in weight. They have little intelligence, cannot reckon up to ten, converse but little with each other, and are more taciturn with strangers, whose very presence even alarms them. They are polygamists, each man having three or four wives. The language they speak is said to be Tamil, and a similar race, it is stated, occupy the neighbouring forests on the hills at Naglawaram, and others are spread through Nellore, N. Arcot and Cuddapah. Indeed, the Yanadi in 1867, in the Nellore District, were estimated by Dr. Lloyd at 20,000, and the residents inland are more robust than those of the Strihari-cottah jungles. The Collector of Chingleput, writing in 1835 to the Madras Board of Revenue, mentioned the miserable circumstances of the Yanadi, whose appearance alone excited the deepest sympathy, living in the jungle in small huts made of such materials as the woods afford; subsisting upon roots, fruits and any thing edible procurable in the jungle, and seldom seeking for grain; generally speaking, with no cloth to cover themselves. Their numbers then were adult men 49, boys 41; adult women 69, girls 40; total 199. Some of them had two or three wives each, and it is a rule among them that every person above 5 years of age shall procure his own subsistence. They had always been employed by the Moottadar in gathering the jungle produce, receiving one Madras measure of paddy and one pollam of tobacco for every 20 handfulls of dyeing stuff weighing about ¾ viss: one measure of paddy and ¼ pollam of tobacco for every viss of sembooram-puttay: one measure of paddy and ¼ pollam of tobacco for one measure of honey, and one measure of paddy each per day for gathering tamarinds. When a woman is brought to bed an allowance of 5 pollams of oil and one fanam was given to her. Pieces of coarse cloth are distributed once a year, for each man 6 cubits for the waist and 3 cubits for the head; for each woman 8 cubits; for children 4 cubits each and occasionally small quantities of grain. The men had then neither the desire nor the ability to take care of the cloth given to them, which is soon destroyed in consequence of their continual perambulations in the thickets. The women carry and sell firewood in the villages, procuring in return pieces of old cloth with which to cover themselves. Many have only a dirty rag round their waist, which they are unable to wash, having no second cloth to put on. They are extremely ignorant and speak a mixture of Tamil and Teloogoo. The hire including cloths, &c. paid to the Yanadi amounted in 1835, to no more than 20 per cent. of the value of the articles procured through their means. This employment lasts only during six months of the year, or from December to May; at other times they get no grain and subsist upon what they can pick up in the jungle. One of them had been nominated by the Mootadar as their headman, in order to prevent their quitting the jungle or idling away their time and to collect them together whenever necessary. In consequence of that report, the Madras Government has since continuously endeavoured to improve their condition, and to this end Dr. Shortt made large exertions, between 1860 and 1870, and in the latter year, about forty of the Yanadi were employed at Vasararapad, near the snake temples, of which they are the priests. —*Proc. Madr. Govt.* 1867. *Dr. Shortt.*

YANG. In Chinese mythological history, the male creative power, from which, and the female, Yin, the universe primeval sprung.

YANG. HIND. Ferula asafætida.

YANG-HOO, or Jih-pun-kwo. See Japan.

YANGI. TURKI. Mr. Elliot supposes that this is the origin of the word yankee. But yangiz, meaning English, seems the more probable derivation.

YANGMA. HIND. Hordeum hexastichon.

YANGMA. CHIN. the loquat, Eriobotrya Japonica, *Lindl.*

YANG-MA-DA. BURM. Abelmoschus esculentus, *W. and A.*

YANGMAI. CHIN. a scarlet fruit, not unlike an arbutus or strawberry, but having a stone like a plum in the centre.

YANG-SEIH. CHIN. Tin.

YANGTASH. HIND. Fragaria vesca.

YANG-TSE-KIANG, is the largest of the Chinese rivers; the city of Nanking is about 150 or 156 miles from its mouth. The entrance is very wide, but divided into two channels by the large island of Tsung-Min on the north. On the shore of its southern entrance is the town of Wosung. The Yang-tse-Kiang river is called by the Chinese the Great River, also the Girdle of China; it traverses the whole of the centre of the empire, rolling its flood of water to the sea through the richest and most fertile part of the country. Its importance to China cannot be too highly estimated. There is no river in the world which has on its banks so numerous a population, amounting at least to one hundred millions of people, who are sustained by its waters in the pursuits of commerce and agriculture. There are more than one hundred cities of the first, second, and third classes, and two hundred towns and villages which could be approached directly from its water way. From its origin in Tibet to its outlet at the sea, its course is about 3,000 miles, the points being distant in a direct line 1,850 miles, and the basin drained by its channel nearly 800,000 sq. miles. The commerce of many of the places situate on the borders of the river is very important. Persons engaged in every variety of trade resort to Han-Khow for the exchange of their respective commodities; men from the north and west, from Mongolia to Tibet and Sze-chuen, bring their wheat, rice, dried and salted vegetables of every kind, bamboo-sprouts, horses, sheep, furs, skins, coal, lead, jade or nephrite, gold in large quantities, rhubarb, musk, wax, and various drugs of northern growth, and exchange them for tea, silk, camphor, opium, various southern drugs, and above all, for very large quantities of Manchester and Leeds goods. The quantity of long cloth and cotton goods that pass through Han-Kow is probably more than half of the whole brought to China, and access to this spot is of great importance. It has long been much desired by merchants that they should be able to inspect personally the trade of this place and take part in it, as from the accounts brought by native traders it would appear to be one of the most important marts in all Asia. Of all the problems now undergoing solution, that of the source of the Nile is the most curious, because of the mystery in which it has been so long enveloped. But in value to humanity generally, in importance to the millions who swarm on its banks, and to the British who have in two expeditions explored its waters, the opening of the Yang-tze-Kiang to the commerce of the world cannot be over-estimated. It is twice the length and breadth of the Ganges, and is the second largest river in the world. The Ganges with all its windings is only 1570 miles from its source to its mouth; the Yang-tse-Kiang is not under 3,000 miles, and is navigable to a point 1,100 miles from Shanghai by large steamers; for some hundred miles above that there is deep water, to which the removal of an obstacle much less than that in the Godavery, would allow steamers to penetrate. Unlike the Ganges, the whole volume of water does not lose itself in tidal creeks, but pours out into the Pacific in one vast stream sixty miles wide. By a ship which has once made the trip pilots are not required. Rising in the snows of the Kuen Lun, it enters China proper not 300 miles from Saddya in the province of Assam; up to this point it is believed to be navigable by boats, for vast rafts of timber laden with hill produce pass down. Captain Blakiston's expedition left the river at a point 1,200 miles from Shanghai, to proceed overland to Chingtoo, the capital of Sze-chuen, the most westerly province, and thence to Lassa. Down the 1,100 miles from I-Chang to Shanghai, the river rolls through provinces of virgin fertility, whence proceed teas and silks which find their way to Canton and Shanghai, and which on the other hand the cottons and woollens of Europe slowly reach, both imports and exports being subjected in transit to the "squeezing" of the mandarins. Till the anarchy caused by the invasion of the rebels and the folly of the imperialists ensued, the plain of the Yang-tse-kiang was the garden of China. From it there runs north to Tien-tsin the Grand Canal up which used to float the whole supplies of Northern China. At a point higher up, the great trunk road from Pekin to Canton crosses the river. Where the Yang-tse-Kiang flows past the Poyang Lake it receives several navigable streams which run through the Black Tea districts to the west, while those from the eastward open up the Green Tea districts. The Shanghai merchants who accompanied Admiral Hope's expedition, describe the Poyang Lake and Kiu-kiang, the chief town, as the centre of a most extensive network of river and canal communication. What Kiu-kiang is at this point, Hankow is still more 200 miles farther up. It stands on high banks at the junction of the Han and Yang-tse rivers, a little below the Tungting Lake. The merchants were eager to trade at Kiu-kiang and at Chin-kiang, between Shanghai and Nankin, the British established consuls and trade became brisk. At Hankow the British "Yamun" stands at the eastern end with a large river frontage. Vessels of the largest draught can lie alongside in eight fathoms of water. The description of the Reach, stretching for six miles in length and about a mile and a half across, shews that it far surpasses Calcutta Garden Reach. The ease and speed of a voyage up the Yang-tse may be gathered from the fact that H. M. S. Atalante left Shanghai on the morning of the 9th April, arrived at Chinkiang on the 11th, at Nanking next day, at Kiu-kiang after resting two days on the morning of the 19th, and at Hankow, after delaying a day and a half, on the 22nd. She was 145 hours under steam. All past commerce with China has been confined to the produce of three seacoast provinces inhabited by sixty millions of people, or only a sixth of the whole population on the most moderate calculation. Yet under all difficulties a trade of 60 millions sterling was created in less than twenty years. In 1857 the trade of Shanghai alone was about 27 millions, in other twenty, when it becomes to the Yang-tse what Calcutta is to the Ganges, it will be the wealthiest city in Asia, the emporium of a river traffic unprecedented. Already its merchants are bringing out their river steamers.

The opening of Yang-tse, and of the new ports of New chang, Tangtchow, Tai-wan in Formosa, Chau-chow (Swatow) and Kiung-chow in Hainan, are facts almost as important to India as to China. In 1859 the legitimate exports of Shanghai were twelve millions against an import of less than seven millions. If we were to deduct opium, there would be a balance of ten millions from the tea and silk sent to Europe, for which England must pay in silver. While the Shanghai merchants found that the prices of British goods at Hankow were not excessive, Wingrove Cooke showed that the piece of cloth which, after being carried 17,000 miles, sold at 12 shillings at Shanghai, easily brought 18*s.* 4*d.* 600 miles in the interior. Merchants say that for woollens strong competitors will be met in the Russo-American and Amoor Companies, who have a monopoly of the Russian trade with China. China offers a vast market for the sugar and rice of India. The sugar trade of Shanghai was upwards of a million sterling in 1859, and had then doubled itself in three years. The amount of rice annually required in Pekin alone is 430,000 tons. At present almost all this sugar and not a little of this rice is shipped from Batavia, Singapore and Cochin China. Some of it is sent indirectly from India. The rise and fall in the Yang-tse-Kiang averages about ten feet, and vessels are obliged to find their way haphazard into the channel, or perchance run upon one of the silted sands. The Tibetan district, the great plateau of mid-Asia, is centrical ethnically as well as geographically to all S. E. Asia and to Asianesia, abuts on the west on the eastern extremity of the primitive Iranian region, and is connected with China and all the sea basins on the east of Asia by means of the Yang-tse-Kiang and Hoang-ho.—*American Expedition to Japan, p.* 166. *Local Newspapers.*

YANTRA. See Tantra.

YARKAND is the chief trading depot or commercial emporium for all Central Asia on the north of the great Himalayan range; caravans of merchants meet there from all the surrounding cities and countries, as well as from the more distant places of Badakhshan, Bokhara, the Russian provinces and China. Nearly the whole of the trade for the Punjab passes through Yarkand, and trading caravans from Bokhara, Kokan and the Russian possessions, Kashgar, Turfan, Aksu and all the cities to the north east, Khotan, and until 1865 from China, all meet at Yarkand, where the merchants barter their goods. Yarkand comprises 30,000 square miles, and contains about twelve large and important towns. The Yarkand pony is a hardy little animal, and fetches a high price, being in request for the hill-stations in the north-western provinces of India. The variety called the Tangun piebald is common. They are shy and timid at first, and evince a strange dislike to Europeans, but soon get accustomed to their new masters, and for their strength, endurance, and sure-footedness are well adapted for alpine travelling. While crossing the Karakoram mountain, whole caravans are sometimes overwhelmed by snow storms, and Billah Shah, the chief merchant of Leh, mentioned that in many places the route to Yarkand is only traceable by the bones of horses. Yarkand, also called Yarkiang, is one of the largest towns of Turkestan. Since the conquest of these countries, the inhabitants pay an annual tribute of 35,370 ounces of silver, 30,340 sacks of corn, 30 ounces of gold, 800 kin of olive oil, and taxes to the amount of 1,649 ounces of silver. Yarkiang is properly pronounced as Yarkand. It was formerly the capital of Eastern Turkestan, and is situated on the great river Yarkand-daria. The river which flows through the town of Khotan bears the same name as that near Yarkand. According to the testimony of well-informed persons, gold of the finest quality is found in it, and is collected by the inhabitants in the environs. In a neighbouring river of Yarkand is found the yu, or oriental jade, the largest pieces are about a foot, and the smallest only two inches in diameter, and sometimes weigh about twelve pood. They are of various colours; some of the jade are as white as snow, some dark green like the most beautiful emerald, others yellow, vermillion, and jet black. The rarest and most esteemed varieties of this stone are the white speckled with red, and the green veined with gold. An inspector is stationed at some distance from the river, and upon the bank is an officer of the garrison with from twenty to thirty Turkestani who are expert divers, who range themselves across the river, and walking in the water, endeavour to discover the stones with their feet; when they have found one, they instantly dive, pick it up, and throw it upon the bank, upon which a soldier gives one stroke upon a drum, and the officers make a red mark upon a piece of paper. The divers, after having finished their work, are obliged to deliver the number of stones marked upon the paper. Three hundred and thirty li from Yarkiang is mount Mirdjai, which is entirely composed of jade of different colours, but this stone is found of the best quality and in greatest quantities only on the highest and most inaccessible points of the mountain. A Turkestani furnished with the necessary tools, ascends the rocks, loosens the stones, and lets them roll down; this kind is called mountain jade. The town of Yarkiang annually sends to the court of Peking from seven to ten thousand kin of this stone. All the jade found at Yarkiang and Khotan, in the rivers Youroung kash and Khara kash, is sent to the court; it is conveyed in carriages under an escort from station to station. Private individuals are not allowed to send any, and the guards on the road are enjoined strictly to enforce the execution of this measure. The Turkestani, however,find means to carry on a trade in jade, and the merchants convey it for them wherever they please. A great fair is held for the Usbek merchants of Bokhara. The language is a dialect of Turki, intelligible to the people of Bokhara. The Kalmuk Tartar women of Ella and Yarkand appear unveiled and are lax in morals.

The Yarkand district occupies a vast depression of between 3,000 and 4,000 feet, separating the Kuen-lun on the northern frontier of the Himalaya-Tibetan system of mountains,—from the Syan Chan, or the mountains of Central Asia, on the southern border of Russia. According to Moorcroft, the town contained from fifty to sixty thousand inhabitants. The people speak Turki. Chinese Turkestan includes the provinces of Yarkand, Kashgar and Khoten. Yarkand is the entrepot of trade between China and Bokhara. Khotan, from the time of Cesias, has been celebrated for its mineral products, its jade and emeralds, its shawl-wool and flax; it was at one time the entrepot of a vast trade with Hindustan, and now imports largely furs, broad cloth, leather, and sugar. Perhaps the term Eastern Turkestan alone should be retained. The inhabitants of the country call themselves Turks, speak the Turkish language, and profess the mahomedan religion. Chinese Tartary, also known as Bucharia, Little Bukharia, also Eastern Turkestan, is a great depressed valley shut in by mountains of great height on three sides; on the east are barren sands which merge imperceptibly into the great desert of Gobi. The Tian-shan range separates it from Dzungaria, the Bolor range from Trans-Oxiana and the Kara-Koram and Kuen Lun from India and Thibet on the south. The land is clayey near the front of the mountain's base, but sandy in the central tracts. Rain is rare, and the air is of exceeding dryness, but the climate is temperate and healthy. It is well watered from the mountains, the waters converging towards the Ergol or Tarym. The country has gold, copper, salt, sulphur and the jade stone. The southern line of the caravan route passes through it from Khamil to Aksu and Kashgar. From Aksu to Kokand is 800 miles. It was subject to China from the beginning of the christian era to the time of Changiz Khan, and after the middle of the 18th century, the Chinese regained possession of it. Alti-shahr, or the six cities, forms the western district, comprising Yarkand, Kashgar, Khotan, Aksu, Yanghisar and Oosh Turfan, with territories subordinate to each. Eastern Turkestan is eminently mahomedan. Elchi, Yarkand, and Kashgar, are the three principal towns in Turkestan. Elchi in L. 36° 50′ N. and L. 78° 20′ E. 5,500 feet. Yarkand, in L. 38° 10′ N. and L. 74° E. 4,200 feet. Kashgar, in L. 39° 15′ N. and L. 71° 50′ E. 3,500 feet. Elchi is represented to have the coldest, as Kashgar the hottest temperature of the three towns throughout the year. Snow falls at Kashgar, but never remains longer than a few hours, but it is seen lying in Yarkand for three or four days together. The Tungani are a race of military settlers who came originally with military conquerors from the west of Asia, and settled down in the country of Yarkand.

Bokhara is an isolated kingdom in Turkestan, of small extent, surrounded by a desert. It lies between the parallel of 36° and 45° N. and 61° 67′ E. lon. It is an open champagne country of unequal fertility, and intersected by the Oxus on its southern border. Its rivers are the Amu or Oxus, the Sir, Syr or Jaxartes, the Kohik or Zarafshan, and the river of Kurshi and Balkh. It is ruled over by an amir whose sway may be comprised between the 37° and 43° north lat., and between the 60° and 68° of east long. The Uzbek are undoubtedly the preponderating race in Bokhara, not so much from their number, as by the ties which bind them together. They are divided into stems and sections, like the Kirghiz, and have their elders, styled bey, who enjoy a certain consideration among them. The Uzbek branches, with some of their subdivisions, are enumerated in the work called "Nassed Mameti Uzbekia." Turkistan is eminently mahomedan, and the rulers of Eastern Turkestan had always been mahomedan from the time of Taghalak Timur, who was, we are told, the first mahomedan sovereign of Kashgar of the lineage of Chinghez. Buddhism indeed was found still prevalent in the cities of Turfan and Kamil at the time of the embassy of Shah Rukh in 1419, and probably did not become extinct much before the end of the century. But, in the western states, mahomedanism seems to have been universal from an earlier date and maintained with fanatical zeal. Saintly teachers and workers of miracles, claiming descent from Mahomed, and known as Khwaja or Hojah, acquired great influence, and the sectaries attached to the chiefs of these divided the people into rival factions, whose mutual hostility eventually led to the subjugation of the whole country. For late in the seventeenth century Khojah Appak, the leader of one of those parties called the White Mountain, (having been expelled from Kashgar by Ismail Khan the chief of that state, who was a zealous supporter of the opposite party or Black Mountain) sought the aid of Galdan Khan, sovereign of the Eleuth or Kalmuk race of Dzungaria. Taking the occasion so afforded, that chief, in 1678, invaded the states south of the Thian Shan, carried off the khan of Kashgar and his family, and established the Khojah of the White Mountain over the country in authority subordinate to his own. Great discords for many years succeeded, sometimes one sometimes another being uppermost, but some supremacy always continuing to be exercised by the khans of Dzungaria. In 1757, however, the latter country was conquered by the Chinese, who in the following year making a tool of the White party, which was then in opposition, succeeded in bringing the states of Turkestan also under their rule.—*Yule Cathay* ii. *p.* 547. *Timkowski's Journey to Peking vol.* i. *pp.* 393-396. See Arians, Kalmuck, Kara-koram, Kirghis, Ladak, Tartar, Yak.

YANGY. TAM. A Tinnevelly timber of a light brown colour, used in wheel-wrights' work.—*Colonel Frith.*

YAM-SAN. CHIN. Ginseng.

YAO. All the ancient traditions of the Chinese refer to their emigrations from the west, and they undoubtedly are a race from the original home of man. Like the Egyptians they seem to have migrated from the original seat prior to the flood of Noah, of which neither race have any tradition. The first settlement of the Chinese people was in the northern portion of Chih le, the province in which the present capital, Peking, is situated. How the first Chinese, the founders of the nation, came to be in that locality, is one of those questions connected with the origin and spread of the human race generally which can only receive a conjectural solution. All we do or can know positively is, that the first portion of authentic Chinese history tells us that Yao or Yaou, who reigned about B. C 2330, had his capital at the new district city of Tsinchow, situated about 100 miles only to the south of the present capital Peking. From this most ancient location the people spread gradually westward and southward, thus steadily increasing its territory. The usual course of the process was, first, colonization of the new regions and displacement from them of whatever aboriginal inhabitants were found; and afterwards political incorporation with the older territory. At times, however, the process was reversed, and military conquest of the aboriginals preceded their displacement by an industrial occupation of their lands. The territorial distinction marked by the terms China Proper and the Chinese empire has existed in fact from the earliest periods of Chinese history. China Proper means at all periods that portion of the east of the Asiatic continent which has been possessed and permanently occupied by the Chinese people. The Chinese empire means at all periods besides China Proper, those large portions of the whole Asiatic continent occupied by Tartar-nomades, or other non-Chinese peoples, but which have from time to time been under the sway of the empire of China, and more or less directly ruled by Chinese officers and armies. China Proper has at all periods been characterized by Chinese civilization; that is to say, its population generally, besides being physically of the same race, has always been governed in its domestic, its social, and (with the exception of some very short periods) its political, life by the principles and rules laid down in the Chinese old reverenced books. The non-Chinese peoples of the Chinese empire have, on the other hand, at all periods, either been destitute of anything that could be called civilization, or have been slightly tinged with Chinese civilization, or have been marked by some different civilization, as, for instance, at present, in the inhabitants of Turkestan by a mahomedan civilization, and the inhabitants of Tibet by one strictly budhistic. The Chinese empire as thus defined has in the course of ages varied greatly in extent. It has been more than once larger than it is even now. It was so for example, B. C. 200 years, under the fifth emperor of the Han dynasty, when it embraced the greater portion of inhabited Asia west of the Caspian sea, and inclusive of Siam, Pegu, Cambogia and Bengal. In the intervals between these great extensions it has shrunk up to the size of China Proper, and even this latter has been occasionally subdivided for considerable periods under two or more ruling families or dynasties, each acknowledging no superior. But the Chinese people has continued the same, even when under several rulers, and has been steadily increasing its territorial possessions by the processes above described.—*T. T. Meadows, Chinese and their Rebellions. An Essay on Civilization, p.* 34, 35-36.

YAP, or Unawb, 63 miles from the Matelota islands, in lat. 9° 35½′ N. and 138° 8′ E.

YAR. KASHM. a side of a lake or a river. Yari-kul, a common expression, signifies the strand or bank of a lake.—*Vigne.*

YAR. PER. a friend; a female companion.

YARA. HIND. Mentha incana, Gaggar yurmi. HIND. is Rhododendron campanulatum.

YARAB. See Joktan.

YARALA, also Putrajivi. TEL. Putranjiva Roxburghii, *Roxb.*

YARI. HIND. KASHMIR. Pinus excelsa. Lofty pine.

YARI-KUL. See Yar.

YAR MAHOMED, a chief of Herat, who died A. D. 1852.

YASOVIGRAHA. See Inscriptions.

YASSAWUL, is an officer of the household, who acts in the capacity of usher in the families of chiefs.—*Fraser's Journey into Khorasan, p.* 25.

YASUDA. See Krishna.

YASUS-KARMA-DEVA. See Inscriptions.

YAT. BURM. a forest term.

YATAGHAN. TURK. is a long dagger, intended for thrusting rather than cutting, and has a curve, which has been copied in the bayonet of the Chasseurs de Vincennes.—*Burton's Pilgrimage to Meccah, v.* ii. *p.* 264.

YA-THA-NAT. BURM. A tree of Moulmein. An inferior wood for boats, which lasts but two or three years. The fruit is an article of food.—*Cal. Cat. Ex.* 1862.

YA-THA-PYA. BURM. A tree of Moulmein. The fruit is edible. Used for house building purposes.—*Cal. Cat. Ex.* 1862.

YA-THIT. In Pegu, Dr. McClelland says, the cutting of Yathit should be, so far as practicable, prohibited. He adds that however desirable it may be to forbid or enforce such a rule, he is at a loss to know how such impediment can be attempted or laid without stopping the trade of mast-pieces. He is of opinion that a large consignment of timber might be realized, and duty received on them, and it will facilitate the growth of the under sized trees.—*Selection Records of Government of India, Foreign Department, No.* ix. *p.* 47.

YATI. Priest of the Jains ; an ascetic ; a Jain religious teacher.

YAU. A tribe who inhabit the skirts of the Arracan mountains westward of Pagan, and who speak a peculiar dialect of Burmese. The Yau country is the tract between the Arracan mountains and the Kyendwen river, at its junction with the Irawaddi between L. 21° and 22° N. and L. 94° and 95° E.

YAUR, Yau, Yo, Jo, or Quoi, a small Burmese tribe dwelling in the valley of the Yau river, great traders and the chief carriers and pedlars of northern Burmah.—*Latham.*

YALUM.—? Elettaria cardamomum.

YAUDHEYA, a Rajput tribe in western Rajputana, the modern Johiya.

YUE-TCHI. The Getæ are referred to as the same with the ancient Chinese Yuechi, and the modern Jut or Jat, but their identity is as yet perhaps rather a reasonable conclusion than a logical or critical deduction. See Vicramaditiya.

YAVA ; Yava biyama ; Paccha yava ; Yavalu. TEL. Hordeum hexastichon, *Linn. Roxb.*

YAVALU, or Java biyyamu. TEL. Hordeum hexastichon, *L.*

YAVAN, or Javan, the seventh son of Japheth. Colonel Tod says the Hericula also claim from Yavan or Javan, the thirteenth in descent from Yagat, the third son of the primeval patriarch.

YAVANA. Bunsen supposes the meaning of the word Yavana to be doubtful, that it may be traceable to times after Alexander, or that it may be an ancient inaccurate name of a people who pushed on towards the Mediterranean. According to Dr. Caldwell, it was a term first applied to the Greeks, and subsequently to any race approaching India from the west of Asia. The name was derived from Javan, whose descendants the Ionians, were the first Greeks with whom the Indians became acquainted, but it came afterwards to signify the Arabs. The Bactrian Greeks are usually termed Yavana in Sanscrit literature, but Colonel Tod warns us not to mistake them for the Yavana descended from Yavana, fifth son of Yayat, third son of the patriarchal Nahus, though the Ionians may be of this race. According to Col. Tod, the Yavan or Greek princes, who apparently continued to rule within the Indus after the christian era, were either the remains of the Bactrian dynasty or the independent kingdom of Demetrius or Apollodotus, who ruled in the Punjab, having as their capital Sagala, changed by Demetrius to Euthymedia. The term Yavana is in modern times applied by hindoos of Northern India to mahomedans of every description, but in works prior to the mahomedan era, some other people must be intended. The interpretation of the word by Sir W. Jones is, Ionians or Asiatic Greeks, and there are some considerations in favour of this, although the chief argument in its behalf is the difficulty of attaching it to any other people. Doubtless, however, Yavana is certainly a term not exclusively applied to the Greeks. According to Professor Lassen it was used to designate only the Semitic nations.—*Bunsen, Egypt's Place in Universal History* iii. 555. *Prin. Ind. Ant.* See Arians, Hindu, Greeks.

YAVANI. A female attendant in the women's apartments. Mahomedan princes had guards of African women in their harems, and female attendants also served in those of the hindu sovereigns. The term Yavana has been applied by the later hindus to the mohamedans, and Yavani seems to have been a term used as distinction of a female servant; it is not likely that either Persian or Arabian women ever found their way into the inner apartments of hindu princes, as personal attendants or guards. Perhaps Tartarian or Bactrian women may have been so designated, as in Madras such women are, in 1872, all styled Mughulani.

Jahr,	GER.	Varsha,	TAM.
Baras,	HIND.	Samutsarum,	TEL.
Anno,	IT.		

A year, as reckoned by Europeans and their descendants, means the solar year. As reckoned by mahomedans it means the lunar year. Christians reckon the years of the christian era from the birth of Jesus Christ, and call the Annus Domini, or year of the Lord, the year of Christ. Mahomedans reckon their Hijrah year from the date of the hijra or flight of Mahomed from Meccah. The hindoos of India use the lunar year, with an intercalary month: they have various eras.

The year of Christ 1867 corresponded to the year

6580 of the Julian Period.

2642-3 of the Olympiads, or the 3rd year of the 661st commenced July 1867.

2614 from the Era of Nabonassar which dates from Wednesday 26th February 3967 Julian Period, or 747 B. C.

2620 from the foundation of Rome, according to Varro.

From the Creation,
5871 according to the Hebrew text.
6172 ,, ,, Samaritan.
7501 ,, ,, Septuagint.
From the Deluge,
4215 according to the Hebrew text.
4865 ,, ,, Samaritan.
5113 ,, ,, Septuagint.

4968 of the Kaliyug,
1789 of the Saka, and
1274 of the Bengali San;
In the Sidereal account, these three commenced Friday, 12th April.

1042-43 of the Cycle of Parasa-Rama, which begins 15th September.

1923-24 of the (Luni solar) Era of Vikramaditya, called Samvat, whereof the 1924th Maru year commenced on Friday 5th April, and the Gujarat, Dakhan and Koncan 1924th year on 24th August.

1788-89 of the Saka Era of Salivahana, of which the 1789th year commenced on the 5th April.
1236-37 of the Parsee Era of Yezdijird, of which the 1237th year of the Kadimi commenced 24th August, and of the Rasami on the 23rd September.
1283-84 of the Hijra or Mahomedan era, the year 1284 commencing on May 6th.
1276-77 of the Fasli era, beginning 6th June.
1267-68 of the Shahur San, or *Sanna Sitain-Miatin-o-alf*, commencing on 6th June.
5627-28 of the modern Jewish Era, of which the year 5628 will commence on September 30th, 1867.

The year 1867 was the 1st year of the 22nd cycle of Grahaparivritthi; the 1st of the 84th cycle of Vrihaspati according to the Tamil account, and 13th of the 85th cycle according to the Bengal account;

It was the year 2410 of the Buddhist era of India, Ceylon, Siam, &c., and 1228 of the Burmese Vulgar era;

and the 4th year of the Chinese 77th cycle of 60 years which begins about 14th February.

Ramadhan (the month of abstinence observed by the muhammadans) commenced 8th January 1867.

A product of the fermentation by which beer is made, upon the surface of which it swims, from involving bubbles of carbonic acid gas. It may be obtained in the form of a firm paste. Mixed with moistened flour, it excites the panary fermentation, and is thus used for baking bread. Yeast is a plant belonging to the Fungi, in the state of sporules or thallus: or the true aerial tufts or heads of sporules, of a multitude of minute oval or circulating bodies or sporules, endowed, under certain favourable circumstances, with extraordinary powers of growth and multiplication. In Britain, three kinds, viz. brewer's yeast, German yeast, and patent yeast, are employed in the manufacture of bread; in the E. Indies, the yeast employed is the fermented juice of the palms, known as toddy. The vitality of dry yeast is destroyed by falls, blows, bruises or rough mechanical injuries, as also—heat, cold, and chemical re-agents. The presence of yeast in a substance containing sugar, or starch convertible into sugar and nitrogenised matter, induces certain chemical changes comprehended under the term vinous or alcoholic fermentation. These changes in the making of bread consist in the conversion of sugar of flour into alcohol and carbonic acid gas; the latter, in its efforts to escape from the dough with which it is mixed, distends it, forming vesicular spaces in its interior, and so causing it to become porous and light. Yeast is capable of producing fermentation in other liquids susceptible of this action. On placing yeast under the microscope, it presents a number of cells immersed in a mass of amorphous matter. The cells are sometimes single, and at other times several are united together in a kind of chain. These cells are supposed to partake of a fungoid character, and they have been called the Yeast-Fungus, or Ferment-Cells. A genus and species have been constituted for the reception of this organism, under the name of Saccharomyces cerevisæ. This plant has been supposed to be the active cause of fermenation, and the carbonic acid given off during that process has been regarded as the result of the growth of the plant. The plant may probably be the result of the carbonic acid given off during the process of fermentation rather than its cause. Schleiden supposes that these ferment-cells originate in liquids, independently of other cells, and are truly instances of the formation of cells, in a free fluid. He observes, however, that they have no power of reproducing other cells. The whole subject of the nature of these cells, their mode of production, and the history of their development, as well as the phenomena of fermentation in general, require further elucidation. In China, yeast is used medicinally. —*Waterston, Schleiden, Principles of Scientific Botany; Micrographic Dictionary, articles* 'Fermentation,' 'Torula,' 'Yeast.' *Smith's Mat. Med. Poole. St. of Commerce.*

YEMEN. The province of Yemen, in Arabia, lies in the southern part of that peninsula and is washed on the west by the Red Sea, and on the south by the Indian Ocean. It comprises Aden, but is of great extent, comprising nearly 70,000 square miles, and consists of two natural divisions, the upper or mountain district, and the lower country called Tehameh. The lower country comprises many desert and sandy tracts; still, notwithstanding the scarcity of water, there are several towns and hamlets on and near the sea coast. Along the shore are numerous small islands, interspersed with coral reefs. Amongst these little islands is that of Tarsen, celebrated for its grotto of pearls. In this district the Beni-Halal bedawin race are the principal tribe. They are very poor, and live principally by plunder.

Tehameh proper occupies the level country lying between north Yemen and Aden. In the north of Tehameh is Lohaya, an Arab settlement consisting of a few stone houses and a number of mud huts. The harbour is good, and the trade in coffee considerable. The island of Kamran, lying about eighteen miles south of Lohaya, has a better harbour than the latter place, and is much frequented by vessels going from India to Jeddah, as here they can be supplied with wood, water, and provisions. Farther south along the coast is the town of Hodeida, having an excellent port, fortified by a small citadel. The town is under the rule of a dola or pasha, and yields a considerable revenue by the tax imposed on coffee. The principal coffee-mart in Arabia is Bait-el-Fakih, situated at a moderate distance from Mokha, and near the mountain regions where the berry grows. The town is of some extent, lying round the citadel, which is built in the centre. Though many of the dwellings were originally constructed of stone, they have become untenantable owing to the depredations of a small white ant. Passing along the coast, we meet many cities and villages until we reach the capital of Tehameh. Zebid town lies near one of the most beautiful and well irrigated valleys in the country. Though still possessing many mosques and other public buildings, with a handsome aqueduct, much of its ancient regal splendour has departed. Zebid still, however, possesses an academy where the youth of Yemen and Tehameh receive a liberal education, according to modern Arabian ideas, and is besides one of the chief meeting-places where the merchants of Egypt, Arabia, and Persia assemble. Farther south lies the celebrated town of Mokha, four centuries old, and second in importance only to Zebid. This portion of Yemen is the least fruitful of the province, but the remainder merits the appellation of "felix" or happy, by which this portion of the great peninsula was distinguished amongst the ancients, as Yemen means peaceful. The whole tract is divided into separate portions by mountains intersecting fertile valleys, and the inhabitants, thus parted, naturally formed themselves into little independent states. Of tracts thus separated by natural divisions, there are seventy-four, of which we shall only mention a few. Azia, celebrated for the bravery of its people, and the valley of Nejran, renowned for the beauty of its site. This fertile region, lying between inaccessible mountains, is watered by numerous streams, and is celebrated for the culture of dates and raisins, that obtain a ready sale all through Yemen. The aspect of this region is beautiful, the mountain to the very top being covered with luxuriant vegetation, and the valleys between offering the picture of a continuous garden. The principal town is Hamdan, about thirty days' journey from Meccah. Of these subdivisions of Yemen, that of Sana is the most southerly, stretching even to the Arabian Sea, where it touches Aden. Yemen, many centuries before the time of Moses, was for a long period the paradise of Arabia, and laid the foundation of that mighty and civilized empire which like the glory of the Fayoom, disappeared from off the face of the earth when the dams were broken through. The Pharaohs had established Egyptian colonies in the country for many centuries, but the reports of travellers during the past 70 years, show that a few thousand years of neglect and devastation have brought the country into its present state of desolation. There is no want of either brooks or springs or cultivable soil, but the former are wasted in morasses or lost in the sand, and the soil is washed away by the violence of the torrents. Southern Oman is but thinly peopled, for the whole number, including women and children, does not exceed fifty thousand; but the northern districts are far more populous and prosperous. Yemen was invaded by the Persians in A. D. 600.

The tract of country called Balad Aden commences at Bab-el-Mandeb, and runs easterly along the coast a distance of 132 miles. This district is for the most part level, and inhabited by native Arab tribes. At about 90 miles from the western extremity, on a rocky promontory, stands the town of Aden. On the same or nearly the same site, there stood in ancient times a city, well known to the Greeks as the depot of the trade carried on between India and Egypt. This city was destroyed by the Romans in the first century of the christian era, a deed of destruction said to have been prompted by the desire of keeping the Indian trade exclusively in Roman hands. As to ruin is easier than to re-edify, we hear little again of Aden until the eleventh century, when we find it again enjoying all the advantages which its position affords. Its commodious harbours were frequented by ships, and the stream of commerce again flowed through the land. During a period of several hundred years Aden enjoyed the supremacy amongst the ports of the coast, but the discovery of the passage to India by the Cape of Good Hope, operated so injuriously on the Arabic city, that in a few years all traces of commercial prosperity departed, and the Turks became masters of Aden. Those were the palmy days of Ottoman power, and the military genius of the new conquerors of Aden showed itself in the erection of fortifications which resisted in the time of their strength, the attacks of some of the ablest European forces, and whose ruins long after excited the admiration of travellers. In 1839, Aden became a British possession, and so rapid were the advances in prosperity that the population, which in 1839 amounted only to 1,000, had, in 1842, risen to nearly twenty thousand, indicative of the readiness with which many of the Oriental races can settle down to peaceful avocations, so soon as they can find for their protection a stable government, though, even yet, the necessity is obvious of placing the residents there out of the power of hostile or mercenary predatory tribes, who, under the influence of malice or avarice, may at any time cut off the necessary supplies. Aden is the principal coal station for steamers navigating the Red Sea, and has a good harbour. The little island of Sirah lying on the east side of the town, forms a bay opposite Aden, and from this point, the peninsula extends three miles westward, forming a commodious and safe harbour. Many persons have found a resemblance between Aden and Gibraltar, a likeness dependent in a great measure on the rocky peninsula which, rising to a height of 1,700 feet, terminates in two points. The similarity is fully established in the scarcity of good water that prevails in both places. The great monarch, Suliman the Magnificent, constructed an aqueduct at Aden, which commenced at a distance of eight miles from the town. The restoration of this aqueduct would, it is thought, supply the want so often felt at Aden.

There are two caravan routes leading from Aden into the interior. Each pursues a different course for some distance, but both diverge considerably to arrive at the town of Lahaj, the capital of the Abdali Arabs. It is a dirty town, containing about 5,000 inhabitants, amongst whom are many Jews. In the south-west, the straits of Bab-el-Mandeb separate Arabia from Africa. These straits are between twenty and thirty miles in breadth, and are celebrated amongst ancient writers for the dangers encountered by navigators who ventured within these gates of tears.

Perim island lies about three miles distant from the Asiatic coast, thus dividing the waters of the strait into two channels, that on the Asiatic side being narrower but deeper, and also free from the impediments offered by small islands, which are rather numerous on the African side. The entrance of a sea, traversed only by English ships, can be of importance to none but the nation to which these ships belong; any interference with the position the British have taken, under such circumstances, must be regarded by them with a jealous eye.

Hadramaut, like Yemen, exhibits great diversities of soil and surface. Some parts of it are dry and desert; but the hills are extremely fertile and are intersected by well-watered vales. Yemen means safety, felicity; the term Al-Yemen, the district of safety, is therefore correctly translated in the words, Arabia Felix. The inhabitants of this province are divided like those of Yemen, into Arabs settled in towns, wandering Bedouins, and Kabail or Highlanders.—*Wellsted's Travels, Playfair's Aden, Niebuhr's Travels, v.* ii. *p.* 105. *Colburn's United Service Magazine and Naval and Military Journal No.* CCCLIV. *May,* 1858. See Himyarite, Jezan, Joktan, Khadim, Kishr, Lohaia, Lokman, Niebuhr, Saba, Samarcand, Sanaa, Yaffa.

YEENGA. Burm. A very abundant but small timber tree found at Moulmein and scattered over the Tenasserim provinces. Its maximum girth is 2 cubits and maximum length 15 feet, and it sinks in water when seasoned. It is a very pretty white wood for furniture, and is used by the Burmese for helves and for mamoties, and though not so strong as chisel-handle-tree, it possesses similar properties, though in an inferior degree. It sells at Rs. 45 per 50 feet by 1 foot square.

YEM-MA-NI. Burm. This tree is very abundant. The Karens say it bears a yellow flower and a small plum which is a favourite food with the barking deer. It is found on the hills of Tenasserim, inland near the banks of the Gyne and Attaran rivers, and at the back of the mountains near Moulmein. Its maximum girth is 4 cubits and maximum length 20 to 30 feet. It furnishes a remarkably light white timber resembling mootchee wood, which, when seasoned, floats in water. It is a slightly scented wood, free from cracks, and the lightest of Captain Dance's collection, who mentions that it is quite free from acid or from a tendency to rot. It is very durable. The Burmese often make canoes of it and use it for boats, and it is employed by the king of Ava for his carved furniture. Captain Dance says it is excellent for fuzes.—*Dr. Mason's Tenasserim, Captain Dance.*

YEMMUKALLU. Tel. Bones.

YEN, or Yein, a tolerably civilized tribe mixed with the Shan, east of Ava.

YE-NAN-GYOUNG. See Petroleum.

YENDIKE. Burm. Dalbergia latifolia, *W. and A., Roxb.* Three species of Dalbergia, nearly allied to sissoo, so valuable for gun carriages, are very common in the southern provinces of Pegu, namely, Dalbergia robusta, D. frondosa, and a third undescribed species common at Yendike, the name of the place being derived from that of the tree. These trees attain a girth of four feet and upwards, and are taller and straighter than the sissoo.—*Dr. McClelland, p.* 10.

YEPA CHETTU. Tel. Azadirachta Indica, *Ad. Juss.* ; *W. and A.*

YEPI, also Vriksha. Can. See Venga maram.

YEPI. Tel. This name is applied in the Madras territories to two species of Bauhinia, B. diphylla and B. Vahlii. B. diphylla and B. Vahlii have a coarse brown bark, of which the natives form a temporary rope for securing thatch, matting or fences. The barks of several of the Bauhinia are used for similar purposes ; the Ara nar is the bark of the B. parviflora, of which the matches for guns are made, the B. racemosa "malfhum," "maljum," or "maloo" grow in the hot valleys of the Himalaya, in the forests of the Sewalik Hills, from the doons of the North West to Assam. It is a magnificent climber, and its product is known as "Patosa" or "bawal" fibre. B. scandens grows not uncommon about Gowhatti and common in Silhet : its fibre is equal in strength to that of sunn hemp, and is made into cordage and cloth.—*Royle.*

YERA GOGU. Tel. Hibiscus sabdariffa.

YERAVER, predial slaves of the present proprietors of Coorg : tempted by the wages offered by the coffee-planters, they have refused to work for their masters. The peasant masters on one occasion came down in force upon one of the coffee estates where a party of Yeraver were working, and carried them off. The same state of things existed in Sonthalistan, where the bondsmen—the nexi or addicti of the Romans—were called "Kumea." The railroad offered them work and wages, and Mr. Yule, the Commissioner, at once refused to give decrees on the debt-bonds which their masters filed in court. He went further and abolished all imprisonment for debt. The origin of this predial slavery is probably the same. If the Yeraver are bond-debtors, the Coorg will produce the bonds and the judge may decide as to their legality. Otherwise they are free men. Yerawar are also a migratory race in Coorg, of middle size, with coarse features, black and straight hair ; they are labourers and are believed to have come from Malabar. Their language is said to resemble Malayalam ; they worship demons and have no priests. —*Friend of India, December* 9.

YERCAUD, a settlement on the southern part of the Shevaroy hills, in Mootoonaad.

YERKAL VADU. Tam.

Basket makers,	Eng.	Yerakedi,	Tel.
Yerkullo var,	Tel.	Yerukelloo,	,,
Eri Kuvadu,	,,	Kurshi wanloo,	,,

In communities they style themselves 'Yerkal,' and they give the same appellation to the language in which they hold communication with each other. Some of them seem to have been converted to the brahminical faith, and are now of the vaishnava sect. With the exception of the cow, almost all animals are used by them as food. Their dead are burned. The Eruku, also called Yerkal, Yerkalvadu, Kurshi-wanlu, Yera-kedi, Yera-kellu, and Erukulu vadu, in the Canarese part of the peninsula of India, occupy themselves ostensibly as basket-makers, and in fortune telling. But they are notoriously predatory, and steal girls whom they devote to prostitution. They are found in mat huts on the outskirts of most towns. The Yerkala of the Nellore District are migratory mat and basket-makers, using the midrib and leaflets of the date palm. They also make wooden combs, work as labourers, and a few have settled and engaged in cultivation. They rear pigs, poultry, donkeys and dogs, and eat the flesh of most animals. They are usually of a dark brown colour, the men are of spare and light make, but hardy, with low fore-heads and eyes, short nose. They wear only a strip of cloth, and they tie their hair in a knot above their brow. They admit polygamy, do not remarry their widows.

Amongst the Yerkala of Southern India, a custom prevails by which the first two daughters of a family may be claimed by the maternal uncle as wives for his sons. The value of a wife is fixed at twenty pagodas. The maternal uncle's right to the first two daughters is valued at eight out of twenty pagodas, and is carried out thus, if he urge his preferential claim, and marries his own sons to his nieces, he pays for each only twelve pagodas, and similarly, if he from not having sons, or any other cause, forego his claim, he receives eight pagodas of the twenty paid to the girl's parents by anybody else who may marry them.

Dr. French says there is a rude uncivilized race in the Kistnah district who are bird catchers. They have no feast or music at their marriages, but the bridegrooms pay a fine or price of Rs. 202 to the bride's parents. The men have only a loin cloth. They are said to eat the cat, mungoose, squirrel, rat, parrot and minah. They snare birds, rear pigs and donkeys, and live by making baskets and mats from the palm leaves. The women are soothsayers. They seem to be the Korava race. Professor Wilson mentions the Koracharu as a hill and forest tribe in the Carnatic, who make bamboo mats and baskets, and carry betel nut from market to market. A Korawa race also inhabit the Hakhal hills and near the Godavery.—*Shortt, Trans. Ethn. Soc. MS. vol.* vii. *p.* 187. *Balfour in Madras Jour. Lit. & Science, vol.* 18 *p.* 4. *Lubbock, Orig. of Civil. p.* 103.

YEUTCHI, Yuchi, or White Hun, are considered by Professor Lassen to be the same as the Tochari or Turk, but Professor Wilson considers the Yeutchi to be identical with the Getæ. See Getæ, Sacæ, Yu-ti.

YEUTLAND, or Jutland, the name given to the whole Cimbric Chersonese.—*Pinkerton on the Goths.* See Goatses Yutu.

YEVA. SANS. TEL. Yavy.

YEVU and Baikuri. CAN. are fish traps adapted to falls. The yevu is a platform made of bamboo, somewhat bellied, so as to lead ladderwise from the top to the bottom of a waterfall at an angle of 45.° The kunjal, another trap, is a rude sort of kuri.

YEW. At Choongtam, in Sikkim, the yew appears at 7000 feet, whilst, on the outer ranges, as on Tonglo, it is only found at 9,500 to 10,000 feet ; and whereas on Tonglo it forms an immense tall tree with long sparse branches and slender drooping twigs, growing amongst gigantic magnolias and oaks, at Choongtam it is small and rigid, and much resembling in appearance the English churchyard yew. At 8,000 feet, the Abies Brunoniana is found, a tree quite unknown further south. But neither the larch nor the Abies Smithiana (Khutrow) accompanied it. The yew, it is said, spreads east from Kashmir to the Assam Himalaya and the Khasia mountains ; and the Japan, Philippine Islands, Mexican, and other N and S. American yews belong to the same widely diffused genus. In the Khasia (its most southern district) it is found as low as 5,000 feet above the sea level. Taxus baccata, *Linn.*, grows in the Mehra forest, near Abbottabad, Hazara. See Japan.

YEYLAKULU. TEL. Cardamom.

YEZAIEMAN. The most abundant supply and the best coal comes from Kiusiu. It is not known how much there is in Nippow, but there is none in Sikofk.—*American Expedition to Japan, p.* 397.

YEZD, is on an oasis in the great Persian desert, mentioned by Barbaro as a most industrious place, flourishing by its silk and cotton manufactures, and supplying with these a large part of Asia. These manufactures still continue. Many important caravan routes converge at Yezd, whilst the desert has given it security, and thus it has become a considerable mart. Yezd is regarded as holy by the mahomedans, a sanctity perhaps borrowed from the fire-worshippers, who still linger here in degradation and scanty numbers. The district of Yezd, if included within the limits of Khorasan, occupies the south-west corner of that province, being encompassed on all sides by salt desert, which separates it from Kerman and Fars upon the south, and from Ispahan of Irak upon the west. The town of Yezd is built on a large sandy plain, encompassed on most sides by hills. It is very large and populous, situated on the edge of a sandy desert, produces little of itself, but with infinite labour, a tract of gardens and orchards has been cultivated near the base of the hills, where very fine apricots and melons are grown.—*Fraser's Journey into Khorasan, p.* 21. *Pottinger's Travels, Beloochistan & Sind p.* 421. *Ramusio,* ii. 106 ; *Ritter,* viii. 265, 270 ; *J. R. A. S.,* viii. 349 *in Yule Cathay I. p.* 52.

YEZDEJIRD III., the last of the Persian kings, who was defeated by Abdullah, son of the khalif Oman. Yezdejird was returning from Khorasan, and for the last time put himself at the head of his subjects. Yezdejird was the forty-fifth king in descent of the race of Kaiumur, with whom ended that Persian monarchy. The khalif Omar invaded Persia, and in a fierce and well contested battle at the village of Nahavand, about fifty miles from the ancient city of Ecbatana, the fate of the empire was decided, the Persian army numbering 15,000 men, being defeated with great slaughter. Yezdejird abandoned his kingdom as lost, and after wandering in disguise for a period of ten years, was treacherously slain in A. D. 651 by a miller to whom his secret had been confided. This event terminated the Sassanian dynasty, and the monarchy founded by Kai Khusru, the Cyrus the Great of the Greeks. The era of Yezdejird III., or the Persian era, began on the 16th June A. D. 632. The year consisted of 365 days only, and therefore its commencement, like that of the old Egyptian and Armenian year, anticipated the Julian year by one day in every four years. This difference amounted to nearly 112 days in the year 1075, when it was reformed by Jelal-ud-din, who ordered that in future the Persian year should receive an additional day, whenever it should appear necessary to postpone the commencement of the following year, that it might occur on the day of the sun's passing the same degree of the ecliptic.

In 638. Yezdejird III, when hard pressed in the uttermost corners of his dominions by the Saracens, had sent an envoy to seek help from the great and powerful Taitsung, emperor of China. The Persian prince, obliged to retire into Turkestan, met in Sogdiana his messenger returning with Taitsung's refusal of assistance. This embassy is mentioned both by Chinese and Arabian historians ; by the former the unfortunate king is styled Yissesse. —*Prinsep's Antiquities by Thomas. Yule Cathay I. p.* lxxxv. See Sassanian, Isakhr, Pappati, Persian Kings, Istakhr.

YEZID, son of Moawiah, who opposed Ali.

YEZIDI. A mahomedan sect of Kurds, who are said to worship the devil. Burton styles the Yezidi, Shaitan purust, or devil worshippers, and states that they term Satan Malak Taos, the Peacock king. The Yezidi nearest represent the old creed of this part of

Asia as it stood before the diffusion of either christianity or mahomedanism. It is apparently older than both. Kinneir says there are a great number of the Yezid in the neighbourhood of Mosul, who worship or rather deprecate the devil; for they have an idea that the power which he possesses over mankind is unlimited. They even dislike to hear the name of the evil spirit mentioned in their presence. They are the descendants of those Arabs who followed the banners of Yezid, son of Moawiah, and fought against Hossein in the battle of Karbela; and Sheikh Adi, the founder of the sect, is interred near Mosul. They adore one Supreme Being as the creator and benefactor of the human race, drink wine and other strong liquors, and circumcise like the mahomedans. The Turks have an astonishing aversion for these people, and the hatred is mutual. Latham describing them says the Yezid is a Kurd, with a Kurd physiognomy, spare frame, dark skin, prominent nose, projecting brow, retreating forehead, black hair; except that some of them are shorter and more squarely-built than others, and some square, rather oval in face. The Sinjar mountains are their chief occupancy. The Yezidi tomb is a fluted cone on square base, and it is sufficiently general and characteristic to denote a Yezid village.

The Yezidi have a tradition that they originally came from Busrah, and from the country watered by the lower part of the Euphrates; and that, after their emigration, they first settled in Syria, and subsequently took possession of the Sinjar hill, and the districts they now inhabit in Kurdistan. There is in them a strange mixture of Sabæanism, Christianity, and Mohamedanism, with a tincture of the doctrines of the Gnostics and Manichæans. Sabæanism, however, appears to be the prevailing feature; and it is not improbable that the sect may be a relic of the ancient Chaldees; a no less remarkable sect the Sabeans, or Mendai (the Christians of St. John, as they are commonly called) still inhabit the banks of the Euphrates and the districts of ancient Susiana. The Yezidi are known amongst themselves by the name of the district, or tribe, to which they respectively belong. Those who inhabit the country near the foot of the Kurdish hills, are called Dasni or Daseni, most probably from the ancient name of a province. Tribes of Yezidi are found in the north of Syria, in Northern Kurdistan, in Bohtan, Sheikhan, and Miessouri. In the plains, their principal settlements are in the villages of Baazani, Baasheikha, and Semil. The Yezidi were some years ago a very powerful tribe. Their principal strongholds were the district visited by Mr. Layard, and the Jabal Sinjar, a solitary mountain rising in the centre of the Mesopotamian desert to the north of Mosul. Below the cluster of buildings assigned to the people of Semil is a small white spire, springing from a low edifice, neatly constructed, and, like all the sacred edifices of the Yezidi, kept as pure as repeated coats of whitewash can make it. It is called the sanctuary of Sheikh Shams, or the Sun, and is so built that the first rays of that luminary should as frequently as possible fall upon it. Near the door is carved on a slab an invocation to Sheikh Shams; and one or two votive tablets, raised by the father of Hussein Bey, and other chiefs of the Yezidi, are built in the walls. The interior, which is a very holy place, is lighted up by a few small lamps. At sunset, as Mr. Layard sat in the alcove in front of the entrance, a herdsman led into a pen, attached to the building, a drove of white oxen. He asked a Cawal, who was near, to whom the beasts belonged. "They are dedicated," he said, "to Sheikh Shams, and are never slain except on great festivals, when their flesh is distributed amongst the poor." The dedication of the bull to the sun, so generally recognised in the religious systems of the ancients, probably originated in Assyria, and the Yezidi may have unconsciously preserved a myth of their ancestors. So far from Sheik Adi being the scene of the orgies attributed to the Yezidi, the whole valley is held sacred, and no acts, such as the Jewish law has declared to be impure, are permitted within the sacred precincts. No other than the high priest and the chiefs of the sect are buried near the tomb. Many pilgrims take off their shoes on approaching it, and go barefooted as long as they remain in its vicinity. The Yezidi recognise one Supreme Being, but so far as Layard could learn, they do not offer up any direct prayer or sacrifice to him. When they speak of the devil, they do so with reverence, as Malik Taos, King Peacock, or Malik-ul-Kout, the mighty angel. Sheikh Nasr distinctly admitted that they possess a bronze or copper figure of a bird, which, however, he was careful in explaining was only looked upon as a symbol, and not as an idol. They believe Satan to be the chief of the angelic host, now suffering punishment for his rebellion against the divine will; but still all powerful. They frequently pass their hands through the flame, kiss them, and rub them over their right eyebrow, or sometimes over the whole face.—*Layard, Nineveh vol.* i. *p.* 275, 288-9, 293, 297, 300, 305, 306. *Richard F. Burton's Sinde, p.* 403. *Colonel Macdonald Kinneir's Geographical Memoir p.* 262-63. *Latham, Nationalities of Europe vol.* ii. *p.* 37-138.

YEZO. The Aino are the aboriginal races of Yezo, but their severe treatment by the Japanese has led them to other countries. They occupy the southern part of the island of Seghalien, which is in possession of the Japanese. The Aino are of short stature with broad faces of the Mongol type. They are a timid race ; their limbs are hairy, they have bushy beards and long tangled hair, large heads and clumsy figures, the expression of their face is that of good nature combined with stupidity. According to M. Rosney their language is dissimilar to Japanese, and that spoken in the Kuriles and in the island of Yesso, are also different from Japanese.—*Adams p.* 240.

YI-DAISE. See India.

YIH-CHAN. See Jews.

YIH-KING. An ancient Chinese book. The annotation of Confucius to the ancient work Yih-King, states that Fuh-he got the idea of his diagrams from a figure on the back of a "dragon horse" that issued from a river. The same annotation states that, before Fuh-he invented the Eight Diagrams, he observed the configurations and appearances in the heavens and the earth, and the marks on birds and beasts ; also that he derived information from his own person and from things around him. These terse passages of an ancient author are, when taken literally, apt to give a ridiculous air to the "Eight Diagrams." But a little examination shows the meaning to be that Fuh-he constructed the Eight Diagrams only after a careful and extensive survey of nature and its varied phenomena, as exhibited in the departments which we call astronomy, meteorology, physical geography, and natural history, and after reflection on his own nature, physical and mental, and on the nature of men generally as manifested in the events of the social life around him. The Eight Diagrams formed in fact, an illustrative figure intended to elucidate Fuh-he's theory of the universe, a theory adopted after careful reflection on all animate and inanimate nature within his ken. They are in so far undoubtedly the foundation of Chinese philosophy, but it must not be assumed that learned Chinese conceive any occult power to lie in them. Much in the same way we might say that the Literary Prince, having been imprisoned (while he was still a vassal of the dynasty he overthrew) by his jealous suzerain, during the years B. C. 1144, 1143, 1142, made in the seclusion a different arrangement of the Eight Diagrams; and he, with one of his sons, Chow kung, who labored after the establishment of the family in the sovereignty, gave permanency to their joint development of the national philosophy by attaching a few words of explication to each of the sixty-four doubled diagrams. Fuh-he's diagrams, as re-arranged, together with the short explications of the first monarch of the Chow dynasty and his son, form the basis or text of the first of the Chinese Sacred Books, the Yih-king. After an interval of six centuries Confucius seems to have used the Yih-king in framing his own philosophical views.

YOA OF KANGRA. Hordeum hexastichon, *Linn. Roxb.*

YOGA, in hindu astronomy, the leading or principal star of a lunar mansion, the position of which is given in the hindu astronomical tables. There are 28 yoga stars (including Abhijit) in the lunar zodiac : but with the exception of 16 or 17 of these (on the identity of which there can be little doubt), it is very uncertain to which of the stars in the European catalogues the remainder correspond. Harshana (which no doubt is the same as our Spica Virginis) seems to be the yoga, which drew most the attention of the ancient hindu astronomers ; probably on account of its convenient magnitude, and declination ; which at the beginning of the 9th century was 9° 38′ 13″ S. To this star they referred the beginning of the 7th month of their solar sidereal year, from which they concluded its beginning ; and there is every reason to suppose that it was on the result of observations of Harshana that they established their Cranti-Pata-Gati, or precessional variation ; a surmise which, if correct, offers a singular concurrence of circumstances, for it was by observations of the same star that Hipparchus first discovered (in the 2nd century before Christ) the motion of the fixed stars from west to east.

YOGA, hindus in their cosmogony divide the age of the world into four yoga, the Satya yoga extending to 1,728,000 years, the Treta yoga, to 1,296,000 years; the Dwapur yoga, to 8,64,000; and the Kali yoga, in which we now live, and which they consider will last 432,000 years. According to Bunsen the four ages of Manu were four states with successive interregna, which the Aryan hindu race really passed through. The first age contains only general mythical representations of divine progenitors: the second period commences B. C. 2400 (2300) prior to the old settlement in the Panjab, on the Saraswati, ending B.C. 1900 (1800). The commencement of the third period was B.C. 1606 (1486) corresponding to the first year of the Kuru and may have lasted 500 years, or down to B. C. 1107 (987). And he estimates the beginning of the Aryan settlement in the Saraswati district as not later than B. C. 2600 or 2500.

YOGA. Abstract devotion. One of the schools of hindoo philosophy teaching the eternity of matter and spirit as well as of god, and the obtaining of final liberation from life by ascetic practices. The Yoga is the third degree in the Saiva systems, and is the practice of abstraction of mind.—*Bunsen.* iii. 562. *Hind. Th. vol.* ii. *p.* 13. *Warren, Kala Sankalita.* See Bhakti, Hindoo, Tantra.

YOGA-BHOGA-VADI. Sans. From yoga, abstraction, Choga, enjoyment, and vada, to utter.

YOGACHARA. Sans. from Yoga, and achara, practice.

YOGA-NIDRA. Sans. from Yoga abstraction, and nidra, sleep.

YOGASASTRA. See Yug-byasa.

YOGA-THEET. Burm. A timber tree of Amherst: wood used for carved images, and the bark used as soap.—*Cat. Ex.* 1861.

YOGESHWARA. Sans. From Yoga, and ishwara, a god.

YOGHOURT. Kurd. A preparation of sour clotted cream or milk.—*Rich's Residence in Koord. vol.* i. *p.* 117, 235.

YOGI, a follower of the Yoga philosophy: a practiser of ascetic devotions; one who, by the practice of the Yoga, has acquired supernatural powers.—*Wilson, Hind. Theat. vol.* ii. *p.* 107.

YOGINI. Sans. A female Yogi.

YOGINI TANTRA. One of the books of the hindu Tantra.

YOGU, a term so pronounced by the Telugu astronomers, but yoga, as spelt by the Carnatic sastri, is an astrological element, containing the same number of accidents as there are yoga in the 27 regular mansions of the lunar zodiac; bearing the same names, and arranged in the same order, but having no sort of astronomical reference to them. A yoga is the time during which the sum of the motions of the sun and moon, amounts to one nacshatra, or 13° 20'. Its mean duration is 59*g*. 29*v*. 21*p*. 75 Indian time (23*h*. 47′ 44·24″ European time); 17 of which are nearly equal to 16 days: which occasions an equation somewhat similar to that of the Cshaya tithi.—*Captain Edward Warren, Kala Sankalita.*

YOHTAN. See Arabs, Joqtan; Yoqtan.

YOIDYU, the professed, though not the exclusive, medical men amongst the Bengali people. They study the Nidană, Rahshita, Drivya-goona, and other medical shastra.—*Ward on the Hindoos, vol.* iii. *p.* 95.

YOJANA. Sans. An astronomical and geographical measure, deduced from the ratio of the diameter of the earth to the circumference of its equatorial circle. The dimensions of the yojana, like those of any other measure, originate in an arbitrary division of extent, for which the hindus have chosen a finger or angula, as a standard to be found in nature. By that common measure they estimate not only distances, and the dimensions of the earth, but even the distance of the planets, their parallaxes, and (when referred to particular points on the surface of the earth) the effects of their longitude and latitude as to time. The hindu mathematicians divide the diameter of the earth into 1,600 parts, whence they have this expression $\surd 10 \times 1600 = 50596$ yojana for the value of the equatorial circle. An angle of one minute of a degree is supposed to be subtended by 15 yojana, at the mean distance of the moon; so that dividing the earth's semi-diameter (800 yojana) by 15, we have 53′ 20″ for the moon's mean horizontal parallax. It follows from this result that 53′ 20″ of the moon's orbit will measure 15 yojana, and that her whole orbit (360°) will measure 324,000 yojana. Hence 5059 (the circumference of a great circle of the terrestrial globe in yojana) is to 800 yojana (its semi-diameter) as 324000 (the circumference of the moon's orbit in yojana) is to 51235 yojana, her mean distance from the earth: from which it follows that this distance (according to the estimate of hindu astronomers) is about 64 semi-diameters of the earth. As the moon is supposed to complete 57753336000 sidereal revolutions in a calpa, this number drawn into 324000, gives 18712080864000000 yojana for her absolute motion during that time. It is a principle in hindu astronomy that the absolute motion of each planet in a day, or any other given time, is equal to the absolute motion of the moon in the same time. Hence, if the absolute motion of the moon during a calpa be divided by the number of mean revolutions completed by any planet, during that period, it will give the cacsha, or circumference of the planet's orbit in yojana. To convert degrees of latitude and longitude into yojana, they use the following proportion. "As 360° to the proposed number of degrees; so 5059 yojana, (the "circumference of the equatorial circle), to the number of yojana sought." The hindus subdivide the yojana into a great number of parts, in the following manner. The yojana ÷ 4 crosa ÷ 1,000 dhanush or danda ÷ 4 resta or cubits ÷ 2 vitisti or spans ÷ 2 pada or foot breadths ÷ 6 angula or finger breadths ÷ 4 yara. Some make the crosa = 2,000 danda or half a yojana, which agrees better with that in which the distances are usually computed. The yojana is regarded in Ceylon as being equal to 16 English miles.—*Hardy's Eastern Monachism p.* 443. *Warren Kala Sankalita.*

YOKADA. Can. Calotropis gigantea, *R.Br.*

YOKH. See Kunawer.

YOKSUN, in Sikkim. occupies a very warm sheltered flat and about it many tropical genera occur, such as tall bamboos of two kinds, grasses allied to the sugar-cane, scarlet Erythrina, and various Araliaceæ, amongst which was one species whose pith was of so curious a structure, that Dr. Hooker had no hesitation in considering the then unknown Chinese substance called rice-paper to belong to a closely allied plant. The Chinese rice-paper had long been known to be cut from cylinders of pith which had always a central hollow chamber, divided into compartments by septa or excessively in plates. The supposition was soon after confirmed, by Sir William Hooker receiving from China specimens of the rice-paper plant itself, which very closely resembles, in botanical characters as well as in outward appearance of size and habit, the above Sikkim plant. The natives of Sikkim collect the leaves of many Aralias as fodder for cattle, for which purpose they are of the greatest service in a country where grass for pasture is so scarce: this is the more remarkable since they belong to the natural family of ivy, which is usually poisonous. The use of this food however gives a peculiar taste to the butter. In other parts of Sikkim, fig leaves are used for the same purpose, and branches of bird-cherry, a plant also of a poisonous family, abounding in prussic acid; and in the N. W. Himalaya, the leaves of the willow, though containing much salicine, are largely gathered as fodder for cattle.

YINARAJAH, See Bactria.

YOM. Arab. A day.

YOMA, a range of mountains in Burmah supposed to be the Mæandrus of Ptolemy. Yoma means great ridge or backbone. The Yomah mountains are the central chain of Burmah proper, are extended into Pegu and form the spine, as it were, of the province with the valley of the Irawaddy on the west, and that of the Sitang on the east; and the several minor valleys lying between the off-shoots by which the chain is terminated on the south, are the valley of the Zamayee or Pegu river, the valley of Hlaine or Line river, together with the intermediate valley of the Phoungee river or Paizoondoun creek, lying between the Hlaine and Pegu rivers. One of the most southern points of the Yomah lies between the Hlaine and Paizoondoun, of which the Pagoda hill at Rangoon may be considered the last elevation, marking the direction of the chain or line of local disturbance. The most elevated portion of the Yoma chain appears to be that from whence these southern branches radiate, where the Oakkan and Thounzai Choungs derive their source, falling into the Hlaine river on the west, and the Zamayee and Phoungyee rivers on the east and south. Dr. McClelland estimates this part of the chain at about 2,000 feet above the sea, presenting steep and inaccessible declivities.—*Dr. McClelland, Selection Records of Government of India, Foreign Department, No. IX, p.* 6, 7.

YONI. Sans. The place or elements of birth, from Sanscrit root yu, to mix. In the physiological religion or philosophy of the hindoos, the lingam and the yoni represent organs of the human body, and the symbols are to be seen in almost every street of every town of British India. It may seem strange that a question of mere physiology should have occasioned, not only a vehement religious contest, but even a bloody war; yet the fact appears to be historically true, though the hindu writers have dressed it up, as usual, in a veil of extravagant allegories and mysteries which they consider as lawfully sacred. They represent Narayana, moving (as his name implies) on the waters, in the character of the first male, and the principle of all nature, which was wholly surrounded in the beginning by tamas, or darkness, the chaos, or primordial night of the Greek mythologists, and perhaps, the thaumaz, or thamas, of the ancient Egyptians. The chaos is also called prakriti, or crude nature; and the male deity has the name of Purusha, from whom proceeded sacti or power, which, when it is ascribed to the earth, in contradistinction to the water, is called shara sacti, or the power of containing, or concerning; but that power, in its first state, was rather a tendency or aptitude, and lay dormant, or inert, until it was excited by the bija, or vivifying principle, of the plastic Iswara. This power, or aptitude of nature, is represented under the symbol of the yoni, or bhaga, while the animating principle is expressed by the linga. Both are united by the creative power of Brahma. The yoni has been called the navel of Vishnu—not identically, but nearly ; for though it is held in the Vedanta, that the divine spirit penetrates or pervades all nature, and though the sacti be considered as an emanation from that spirit, yet the emanation is never wholly detached from its source ; and the penetration is never so perfect as to become a total union or identity. In one point of view, Brahma corresponds with the Chronos, or time, of the Greek mythologists : for through him generations pass on successively ; ages and periods are by him put in motion, terminated, and renewed ; while he dies and springs to birth alternately ; his existence or energy, continuing a hundred of his years, during which he produces and devours all things of less longevity. Vishnu represents water, or the humid principle ; and Siva or Iswara, fire, which recreates or destroys, as it is differently applied. Prit'hivi, or earth, and Răvi, or the sun, are severally trimurti, or forms of the three great powers, acting jointly and separately, but with different natures and energies ; and by their mutual action, excite and expand the rudiments of material substances. The word murti, or form, is exactly synonymous with eidola, and, in a secondary sense, means an image, but in its primary acceptation, it denotes any shape or appearance assumed by a celestial being. Our vital souls are, according to the Vedanta, no more than images, or "eidola" of the Supreme Spirit ; and Homer places the idol of Hercules in Elysium, with other deceased heroes, though the god himself was at the same time enjoying bliss in the heavenly mansions. Such a murti, say the hindus, can by no means affect with any sensation, either pleasing or painful, the being from whom it emanated, though it may give pleasure or pain from collateral emanations from the same source. Hence they offer no sacrifices to the Supreme Essence, of which are our souls or images, but adore him with silent meditation ; while they make frequent homa, or oblations, to fire, and perform acts of worship to the sun, the stars, the earth, and powers of nature, which they consider as murti, or images, the same in kind as ourselves, but transcendently higher in degree. The moon is also a great object of their adoration, for though they consider the sun and the earth as the two grand agents in the system of the universe, yet they know their reciprocal action to be greatly affected by the influence of the lunar orb, according to their several aspects, and seem to have an idea of attraction through the whole extent of nature. This system was known to the ancient Egyptians ; for, according to Diodorus (Book i.) their Vulcan, or elemental fire, was the great and powerful deity whose influence contributed chiefly towards the generation and perfection of natural bodies ; while the ocean, by which they meant water in a collective sense, afforded the nutriment that was necessary, and the earth was the capacious receptacle in which this grand operation was performed. Hence Orpheus described the earth as the universal mother ; and this is the true meaning of the Sanskrit "anda-amba." Such is the system of those hindus who admit an equal concurrence of the two principles ; but the declared followers of Vishnu profess very different opinions from those adopted by the votaries of Siva or Iswara. Each sect is also subdivided according to the degree of influence which some of them allow to be possessed by that principle, which, on the whole, they depreciate ; but the pure Vaishnava are, in truth, the same with the Yonija. This diversity of opinion seems to have occasioned the general war which is often mentioned in the Puranas, and was celebrated by the poets of the West as the basis of the Grecian mythology : here is meant that it was a war between the gods led by Jupiter, and the giants, or sons of the earth, or in other words, between the followers of Iswara and the Yonija, or men produced, as they asserted, by Prit'hivi, a power or form of Vishnu. In the mythical war above-mentioned between the Lingacita and Yonija : the former stood their ground pretty well at first, but were in the end defeated, and shamefully routed in the battle through the potency of the sacred yoni. Mahadeva, enraged, was about to destroy them by the fire of his eye, but Parvati interposed, and, to appease him, made use of the same artifice that Babo did to put Ceres into good humour ; and showed him the prototype of the lotus. Mahadeva smiled and relented, on condition that the Yonija should instantly leave the country. Whether this legend allude to a real war between the worshippers of the linga and yoni, or be a mere physiological allegory, Mr. Wilford could not determine. Nonnus (Dionys. Book xxx. iv. v. 241) expressly declares that the war in question arose between the partisans of Jupiter and those who acknowledge no other deities than water and earth. According to both Nonnus and the hindu mythologists, it began in India, whence it was spread over the whole globe ; and all mankind appear to have borne a part in it. These religious and physiological contests were disguised in Egypt and India under a veil of the wildest allegories and emblems. On the banks of the Nile, Osiris was torn in pieces ; and on those of the Ganges, the limbs of his consort, Isi, or Isati, were scattered over the world, giving names to the places where they fell, and where they are still superstitiously worshipped. In the Sanskrit book entitled MahaKala Sanhita, we found the Grecian story concerning the wanderings of Bacchus; for Iswara, having been mutilated through the imprecations of some offended muni, rambled over the whole earth bewailing his misfortune; while Isi wandered also through the world, singing mournful ditties in a state of distraction. There is a legend in the Servarasa, of which the figurative meaning is more obvious. When Sati, after the close of her existence as the daughter of Dacsha, sprang again to life in the character of Parvati, or mountain-born, she was reunited in marriage to Mahadeva. This divine pair had once a dispute on the comparative influence of sexes in producing animated beings; and each resolved, by mutual agreement, to create apart a new race of men. The race produced by Mahadeva was very numerous, and devoted themselves exclusively to the worship of the male deity; but their intellects were dull, their bodies feeble, their limbs distorted, and their complexions of different hues. Parvati had at the same time created a multitude of human beings, who adored the female power only, and were all well shaped, with sweet aspect and fine complexions. A furious contest ensued between the two races, and the Lingaja were defeated in battle. But Mahadeva, enraged against the Yonija, would have destroyed them with the fire from his eye, if Parvati had not interposed, and appeased him: but he would spare them only on condition that they should instantly quit the country, to return no more. And from the yoni which they adored as the sole cause of their existence, they were named Yavana. "It is evident that the strange tale from the Servarasa was invented to establish the opinion of the Yoniancita or votaries of Devi, that the good shape, strength, and courage of animals, depend on the superior influence of the female parent, whose powers are only fructified or put into action by the male aura. But the Lingancita maintain an opposite doctrine. There is also a sect of hindus, by far the most numerous of any, who, attempting to reconcile the two systems, tell us, in their allegorical style, that Parvati and Mahadeva found their concurrence essential to the perfection of their offspring; and that Vishnu, at the request of the goddess, effected a reconciliation between them; hence the navel of Vishnu, by which they mean the os tincæ, is worshipped as one and the same with the sacred yoni." Mr. Wilford proceeds to show the identity of this with the umbilical mystery symbolized in the temple of Jupiter Ammon, combined with the fossa navicularis, or mystical boat, of Iris. "The mystical boat," he continues, "is called also by Greek mythologists, the cup of the sun; in which Hercules, they say, traversed the ocean: and this Hercules, according to them, was the son of Jupiter. But the Greeks, by whom the notion of an avatara, or descent of a god in a human form, had been generally adopted, considered those as the suns whom the hindus consider as incarnate rays, or portions, of their several deities. Now Jupiter was the Iswara of the hindus, and Osiris of the Egyptians; and Hercules was an avatara of the same divinity, who is figured among the ruins of Luxore, in a boat, which eighteen men bear on their shoulders. The hindus commonly represent this mystery of their physiological religion by the emblem of the nymphæa, or lotus, floating like a boat on the boundless ocean; where the whole plant signifies both the earth and the two principles of fecundation. The germ is both Meru and the linga; the petals and filaments are the mountains which encircle Meru, and are also a type of the yoni. Another of their emblems is called argha, which means a cup, or dish, or any other vessel in which fruit and flowers are offered to the deities, and which ought always to be shaped like a boat; though the argha are of many different forms—oval, circular, or square: and hence it is, that Iswara has the title of Arghanatha, or lord of the boat-shaped vessel. A rim round the argha represents the mysterious yoni, and the navel of Vishnu is commonly denoted by a convexity in the centre, while the contents of the vessel are symbols of the linga. This argha, as a type of the adhara sacti, or power of conception, excited and vivified by the linga, priapus or phallus, is supposed to be one and the same with the ship Argo, which was built, according to Orpheus (Argon. verse 66) by Juno and Pallas, and, according to Apollonus (Book II) by Pallas and Argus, and at the instance of Juno. The word yoni, as it is usually pronounced, nearly resembles the name of the principal Hetruscan goddess; and the Sanskrit phrase Arghanatha Iswara, seems accurately rendered by Plutarch (on Iris and Osiris), when he asserts that Osiris was commander of the Argo. Though it cannot be affirmed that the words p'hăla or fruit, and p'hūlla, a flower, had ever the sense of phallus, yet fruits and flowers are the chief oblations in the argha: and trip'halli or trip'hadi is a name sometimes given, especially in the west of India, to the trisula or trident of Mahadeva. Jupiter triphylleus, of the Panchan islands, was no other than Siva holding a triphala, or triphadi, who is represented also with three eyes, to denote a triple energy; as Vishnu and Prit'hivi are severally typified by an equilateral triangle, (which likewise gives an idea of capacity,) and conjointly, when their powers are supposed to be combined by two such equal triangles intersecting each other." (*As. Res. vol.* iii. *p.* 365.) One of the legends connected with the subject of linga, yoni, arga, &c., is that one day, as Mahadeva was rambling over the earth. naked, he chanced to pass near the spot where several muni were performing their devotions; Mahadeva laughed at them, and insulted them in very provoking and indecent terms, enforcing his abuse by significant signs and gestures. The offended muni cursed him; and the linga, priapus or phallus, fell to the ground. Mahadeva, in this state of multilation, travelled over the world, bewailing his misfortune: his consort too gave herself up to grief, and followed him in a state of distraction, repeating mournful songs. This, Mr. Wilford says (*As. Res. vol.* iv. *p.* 366) is what the Greek mythologists call the wanderings of Dematur, and the lamentations of Bacchus. The world being thus deprived of its vivifying principle, generation and vegetation were at a stand; gods and men were alarmed; and having discovered the cause of it, searched for and found the sacred linga, grown to an immense size, and endowed with life and motion. Having worshipped the sacred pledge, they cut it into thirty-one pieces; which, polypus-like, each became a perfect linga. The devata left one and twenty of them on earth, carried nine to heaven, and one to the inferior regions, for the benefit of the inhabitants of the three worlds. To satisfy Devi, and restore all things to their former situation, Mahadeva was born again, in the character of Bal-Iswara, the infant lord; but suddenly became a man, under the title of Lileswara, or Iswara who gives delight: and after various adventures met his consort then in the character of Sami Rama, who, by the sweetness of her voice in chaunting her own metamorphosis and that of Lileswara, attracted the notice of her former and future spouse in his present character—till now entirely indifferent to the female sex. The goddess soon become Lileswari, and was happily re-united to her lord. In reference to what is stated by Mr. Wilford in the As. Res. vol. viii. p. 256, the goddess in this character ought rather, perhaps, be called Sami Devi.

Hindus insist that the black stone in the wall of the Kaaba (or sacred temple of Mecca). is no other than the linga, or priapus or phallus of Mahadeva; and that it was placed there by Mahomed out of contempt: but the newly-converted pilgrims would not give up the worship of the black stone, and sinistrous portents forced the ministers of the new religion to connive at it. Mr. Wilford, in the eighth volume of the Asiatic Researches, continues his essay on the Sacred Isles in the west, from which is taken the following description of Meru, the fabulous mountain so often referred to by eastern mythologists:—"Meru is the sacred and primeval linga, and the earth beneath is the mysterious yoni, expanded, and open like the padma, or lotus. The convexity in the centre is the os tincæ, or navel, of Vishnu; and they often represent the physiological mysteries of their religion by the emblem of the lotus, where the whole flower signifies both the earth and the two principles of its fecundation: the germ is both Meru and the linga: the petal and filaments are the mountains which encircle Meru, and are also the type of the yoni: the four leaves of the calyx are the four vast regions towards the cardinal points: the leaves of the plant are the different islands in the ocean round Jambu: and the whole floats upon the water like a boat. At the end of the essay are curious plates, representing Meru under the fanciful semblance of a lotus, and other geographical extravagances of the hindu puranica, or poetical fabulists. The hindus do not say, like the Chaldeans, that the earth has the shape of a boat which is only a type of it. It is their opinion that at the time of the flood, the two principles of generation assumed the shape of a boat with its mast, in order to preserve mankind. Enthusiasts among the hindus, see these two principles everywhere; in the clefts of rocks, commissures of branches, peaks among mountains, &c. The earth is typified by a boat; the argha of the hindus, and the cymbium of the Egyptians, are also emblems of the earth, and of the mysterious yoni. The argha, or cymbium, signifies a vessel, cup or dish, in which fruits and flowers are offered to the deities, and ought to be in the shape of a boat; though there are to be seen many that are oval, circular, or square. Iswara is called Argha nat'ha (or the lord of the boat-shaped vessel): and Osiris, according to Plutarch, was commander of the Argo, and was represented by the Egyptians in a boat carried by men, who might, with propriety, be called Argonauts. The ship worshipped by the Suevi, according to Tacitus, was the argha, or argo, and the type of the mysterious yoni. The Argha with the linga of stone, is found all over India as an object of worship; it is strewed with flowers, and water is poured on the linga. The rim represents the yoni, and the fossa navicularis: and instead of the linga, Iswara might be represented standing in the middle, as they used to do in Egypt." The ling, linga or lingam, is always a conical stone.

According to another hindu legend, during the general deluge, Brahma, or the creating power, was asleep at the bottom of the abyss: the generative powers of nature, both male and female, reduced to their simplest elements, the linga and the yoni, assumed the shape of the hull of a ship, since typified by the argha, whilst the linga became the mast. In this manner they were wafted over the deep under the care and protection of Vishnu. Mr. Wilford adds in a note, that "Mahadeva is sometimes represented standing erect in the middle of the argha in the room of the mast." The Greeks seem to have brought with them an acquaintance with the physiological worship of the East-Aryans since styled hindus. The most ancient oracle and place of worship at Delphos was that of the earth in a cave, which was called Delphi, an obsolete Greek word, synonymous with yoni in Sanskrit: for it is the opinion of devout hindus that caves are the symbols of the sacred yoni. This opinion prevailed also in the west; for perforations and clefts in stones and rocks were called cunni diaboli by the first christians, who always bestowed the apellation of devils on the deities of the heathen. Perforated stones are not uncommon in India; and devout people pass through them, when the opening will admit of it, in order to be regenerated: if too small, they put the foot or hand through it, and, with a sufficient degree of faith, it answers nearly the same purpose.

In the Ins. of Menu, c. 1. v. 10, the waters are called Nara, because they were the first production of Nara, or the Spirit of God; and since they were his first ayana, or place of motion, he is thence named Narayana, or moving on the waters. Narayana in his watery cradle, is deemed a most mystical and profound subject: his boat-shaped argha, its rim, its termination; the endless figure he assumes by the puerile conceit of putting his toe in his mouth, is supposed symbolical of eternity. The cradle is also styled vat patra, meaning the leaf of the sacred pipala; and paupater, or leafy vessel; as well as argha patra, also known by each of the words forming the last. In marriage, and in funeral ceremonies, as well as in that copious sacrifice of srad'ha, an argha is an indispensable utensil. The fanciful imageries of the hindus are of endless number. At the very extremity called Malabar Point, is a cleft rock, to which numerous pilgrims and persons resort for the purpose of regeneration by the efficacy of a passage through this sacred type. This aperture is of considerable elevation, situated among rocks, of no easy access, and, in the stormy season, incessantly buffetted by the surf of the ocean. The hindus however, are prone to fancying a type of some thing mysterious in almost every subject that can come under their contemplation: any thing hollowed out, conveying an idea of capacity, they deem typical of the yoni, or argha, itself a type of female nature, or the sacti, or power of Siva: the sea, a pond, a well, a cave, the palm of the hand, or any thing similarly hollowed, convey to their enthusiastic minds an idea of the argha; and their periphery, real or imaginary, an idea of the yoni. In like manner, a mountain, a hill, a tree deprived of its boughs, a mast, a pole, an obelisk, a pyramid, or anything conical or erect, excites an idea of the linga; and such objects they can fancy its symbol: a conical stone is particularly so esteemed, or fire, whose natural and necessary form is conical. Hence a triangle, with its apex upwards, is the immediate type of Mahadeva, who in some relations is fire personified. Vishnu is, in like manner, a personification of the principle of humidity; and water is symbolized by a cone, or triangle, with its apex downwards: these types correctly denoting the ascending and descending properties of their respective prototypes, elemental fire and water. The two conjoined, like the masonic symbol, express the junction or union of the two elements, or deities: this mark, or character, is said to represent also Vishnu and Prit'hivi, of whom an equilaterial triangle is severally the type. The larger the object, the more vernerable: the pyramids and obelisks of Egypt have been supposed of this origin. The sea itself, or rather its containing concave, is regarded the argha of the world.—*Major Moor's Hindu' Pantheon, p.* 399. *Coleman's Hindu Mythology. As. Res. vol.* ii. *p.* 471. *Mr. Colebrooke in vol.* vii. 8 & 9, *p.* 256. *Mr. Wilford in do.* iii. 365; iv, 366; vii, 256, viii, 274, ix. YONIJA. See Yavana, Yoni, Yonicita.

YOONG. Burm. Conocarpus acuminatus, *Roxb. Royle.*

YOORAB. See Saba.

YOOSHOOUNG. See Kunawer.

YOOSOO. See Kunawer.

YOOZ. See Kokan.

YOQTAN. Father of thirteen races of South Arabia.

YORA-BANGALA, from yora a pair, and bangala, a one-storied house; an idol-temple, made like two thatched houses or bangala, placed side to side; and has what is called in England a double-pitched roof, generally covered with tiles or bricks. The front is open without doors. These temples are dedicated to different gods, but are not now frequently built in Bengal.

YOUART. Pers. curds and whey, the principal delicacy to be found amongst the wandering tribes near Syria.—*Eothen's Travel from the East p.* 50.

YOUMA-DOUNG, the Arracan range of mountains, length about 600 miles from Munnepoor, lat. 22° 20', to Cape Negrais, lat. 16°. The average height is 3,000 to 5,000 feet. Blue Mountain in lat. 22° 37', and long. 93° 11', is 8,000 feet. Pyramid Hill is 3,000 feet. The crest of Aeng Pass is 4,517 feet. The pass from Podaungmew to Ramree is 4,000 feet. From Blue Mountain there is a gradual slope to C. Negrais, which is about 300 feet high. The Youmadoung is a continuation of the great mountain chain commencing at the S. of Assam, in 26° 30', and extends S. running parallel with the river Irawaddy, and forms a natural barrier between Arracan and Ava.

YOUNG. Captain James, I. N. Author of Memoir of the Maldive Islands. Bom. Geo. Trans. 1836—1838; Bombay reprint, vol. i. 54—Account of famine in the Laccadives in 1841, in Bombay Times, August 13, 1851; Madras Spectator and Bombay Times, October 1, 1847.

YOUNG, Captain John, younger brother of Captain James Young. Author of Currents in the Arabian Sea. See Orlebar's account of in Athenæum, 1847; Rep. Brit. Ass. 1848.

YOUNG-MA. Chin. Eriobotrya Japonica. Loquat.

YOUNG-THA. Burm. This tree is found in moderate quantities along the sea coast near Tavoy and Mergui. Its maximum girth is 3 cubits and maximum length 30 feet. The seasoned timber sinks in water. It is a heavy durable wood, used for posts and planks of houses, and not bad for planes or handles, though surpassed for these by other woods of Amherst, Tavoy and Mergui.—*Capt. Dance.*

YOWL ISLAND, a name of Aiou island.

YOW-MA-LAY. Burm. In Tavoy, a strong, heavy, rough, white wood; used for house-posts.—*Mr. Blundell.*

YSERHOUT. Dut. Iron wood.

YU the Great, is the first Chinese monarch of whose reality there is no doubt, and his accession occurred about 2000 years before the Christian era. Systematic Chinese history hardly goes back so far as B.C. 2000, i.e., to the reign of Yu. Yu was the founder of the dominion of the kings or princes of Shen-si in S. China, as far as the great river. He diverted the course of the Yellow River to fertilize the lands between the two rivers.

YUCCA, a genus of plants belonging to the section Aloe, of the natural order Liliaceæ. The corolla is inferior, bell-shaped, its segments without nectaries; stamens club-shaped; style none; berry hexagonal, of six cells; seeds numerous, flat. The species of Yucca are natives of the southern provinces of the United States, and being there exposed to extremes, are capable of living in the open air, both in Europe and India. They are conspicuous for their noble show of lily-like white flowers, as well as for their long sword-shaped leaves terminated by a thorny point. They, no doubt, all abound in fibre, and some of a fine quality and strong in nature, has been sent from Madras, separated from the leaves of the Yucca angustifolia. Other species flourish as far north as in the botanic garden at Saharunpore. The fibres also take colour, and specimens were sent from Madras, dyed red, orange, purple, and green. Fibre has also been separated from other species of Yucca, as Y. aloifolia and Y. filamentosa. The Yucca fibres are amongst those which have received the name of silk-grass. Those sent from India are from two to four feet in length, and are rather wiry, or resembling those of the Agave more than they do the fibres of Bromelia. Y. gloriosa, *L.*, common Adam's-needle, is a caulescent plant with lanceolate straight furrowed leaves, their edges smooth and entire; it is a handsome plant, a native of Peru and North America. It grows on the shores of Carolina, where it blossoms in July and August, its panicle of elegant flowers attaining a height of 10 or 12 feet. In British gardens the stem of this plant does not attain a height of more than 2 or 3 feet. Y. aloifolia, *L.*, aloe-leaved Adam's-needle, has linear, lanceolate even straight leaves, with the edges bordered by fine callous notches, it is a native of North and South America. Y. draconis, *L.*, drooping-leaved Adam's-needle, and Y. filamentosa, *L.*, thready Adam's-needle, are cultivated in England for ornament. The latter grows in the open air, and blossoms in the autumn. Its flowers are panicled and pendulous, and of a cream colour. The leaves have their edges beset with long recurved threads. The several species are quite hardy.—*Roxburgh. Voigt. Hort. Calcuttensis Sububranus, p.* 661-662. *Mad. Exhib. Jur. Rep.* See Evergreens.

YUCCA ALOIFOLIA, *L*, produces a white, pliant and strong fibre, resembling that of the Agave in all respects, but is apt to be discolored by steeping, which the Agave is not.—*Royle, Riddell. M. E. Juries' Report.*

YUCCA GLORIOSA. Adam's-needle. is sometimes called an Aloe, has a strong, fine, but rather stiff fibre, suited for the manufacture of cordage; it very soon becomes discolored by steeping, but is not so liable to rot as some of the other fibres of this kind; the plant is not abundant in Southern India, but grows easily and might be propagated to a great extent.—*M. E. J. R.*

YUCHI, or Tochari, a Scythian tribe, who dispossessed the Sakæ Scythians of their conquests in Afghanistan. They retained their power in Northern India until the third century of our era. Ambakapi or Amakatis, are two mounds, ruins of ancient cities where three brothers, Sir Kass, Sir Suk, and Amba, ruled about 1800 or 1900 years ago. This date would make the three brothers contemporary with Hushka, Jushka, and Kanishka, the three great kings of the Yuchi or Kushan race of Indo-Scythians, with whom General Cunningham on other grounds, is inclined to identify them. The Yuchi people are believed to have been of a Tibetan race, who became known in the west as Indo-Scythians, and at a later date as White Hun. They were driven from their seats somewhere between China and Khotan, by the great Turkish race of Hiong-nu. After some intermediate halts they arrived first in Tawan, or Farghana, and afterwards in Tahia, or Bactriana, where they destroyed the Greek dynasty and settled themselves. The Chinese emperor was desirous of opening communication with them in order to excite a diversion against the Hiong-nu, the constant disturbers of the Chinese frontier, and about B. C. 135 he sent for this purpose a party under an officer called Chang kian. On their way they were caught by the Hiong-nu and kept prisoners for ten years. Chang-kian then escaped with some of his comrades, but adhering to his mission succeeded in reaching Tawan, where he was well received by the people who were acquainted by fame with the powers and riches of China, though they had never had any direct communication with that country. Finding that the Yuchi had gone south to Bactriana, he followed them thither, but failed to induce them to quit their new seats upon the Oxus. to return to their eastern deserts and battle with the Hiong-nu.

During the first century, the power of China had decayed and the Hiong-nu recovered their ascendancy. In A. D. 83, however. Panchao, one of the most illustrious commanders in the Chinese annals, appeared in the field, and in a few years recovered the Uigur country and all western Tartary to the empire.—*Yule Cathay I. p.* liv. lv. *Cunningham Ancient Geography of India.* See Greeks, Kabul, Kandahar, Afghan, Jat, White Hun.

YUDHISHT'HIRA. A prince of great celebrity in hindu history, who, according to Indian authors, reigned about the beginning of the Kali yug; some, however, fix the epoch of his reign 658 years later, or in the year 2448 before Christ He is said to have been contemporary with the astronomers Parasara and Garga.

The commencement of the Kali yuga 3101 B. C. The true date seems to have been about B. C. 1400.

Yudhisht'hira and Baldeva, after the Mahabharata, returned to Saurashtra, and after the death of Krishna, they went northwards and are supposed to have reached Greece. Yudishtra, commonly called Dharma rajah, was the eldest of the five Pandava.

Yudhisht'hira is a Sanscrit term from yuddah, war, and st'hira, firm. See Inscriptions, Magadha, Mahabharata, Krishna, Polyandry, Pandu.

YUE. See Kwang-tung-chi.

YUEN. The Yuen dynasty of China, which succeeded the Sungh in A. D. 1271, were Mongols, immediate descendants of Chenghis Khan, who adopted Chinese civilization only in a very slight degree, and were consequently soon expelled again. The first emperor of the native dynasty, the Ming, which succeeded them in A. D. 1368, though a promoter of literature, was himself illiterate, having been a servant in a monastery. But the third sovereign of the line who began to reign A. D. 1403, had a splendid library formed and several encyclopædic works compiled. He published an edition of the Sacred Books, which is known by the affix to their title of "Tatreuen," in full completeness.

YUG, Yuga, or Yoga, signifies properly the conjunction, and sometimes the opposition of the planets. It is, however, more generally used for signifying a long period of years, at the expiration of which certain phenomena, or circumstances, recur. The principal series of the yug made use of in present times in astronomical computations, are the Maha yug, Satya, Treta, Dwapara, and Kali yuga. It is generally admitted that ancient hindu astronomers invented their yug with reference to some of Jupiter and the Sun's conjunctions, in the beginning of the zodiac; and that more recent ones with a view to lengthen their periods, have referred them to those of Saturn and the Sun. Modern European commentators have made great alterations in the epochs and durations of these yug, without changing their names. Yuga dina (sometimes written yugadia) means the anniversary of the day on which the current mahayug, and any one of the four lesser yug began; which anniversary is always noticed in the calendar. Telugu astronomers use sometimes the term yugadia for ahargana. Kala, or Cala, Time, in its natural acceptation, is a term applied to a great variety of mathematical and astronomical subjects.—*Captain Edward Warren, Kala Sankalita.*

YUH. CHIN.

Jade,	ENG.	Sutash,	TURK.
Yashm,	PERS.		

This mineral is supposed by most to be jade, but Mr. Crawfurd calls it noble serpentine. James Prinsep considers that this mineral is prase rather than jade. Both Crawfurd and Pemberton call this green, translucent and very hard mineral, noble serpentine. It is found in the long narrow valley of the Ooroo or Oru, a tributary of the Ningthe or Kyendwen, some fifty or sixty miles west of Mogoung. The mineral is dug up by the Shan and Kakhyen races; it is found in the form of boulders embedded in yellow clay, and the larger blocks are transported by means of bamboo frames, borne by four or five men. It is largely purchased by the Chinese in Burmah for exportation to China, where it fetches an extravagant price, and is manufactured into cups, bracelets, &c. It is of the Yuh stone that the Chinese form their waved emblem of longevity, specimens of which sometimes bring 100 dollars. Respectable Chinese at Amarapoora represent this trade as amounting to from six to ten lacs of tikals per annum. This is probably exaggerated ; but the mineral is said to sell in China for twice its weight in silver. Dr. Bayfield was informed that the duty on the stone sometimes reached 40,000 rupees a year. Captain Hannay, however, was told at Mogoung that, including this duty, the revenue of the town and neighbouring villages did not exceed 30,000 rupees a year. The persons who come to make the purchases are Chinese mahomedans.

It is met with, also, in Fung-t'ien-fu (Shingking), Lien-chau-fu (Canton), in Shan-tung, near Khoten, Karakash, Yarkand, and other places in Turkestan and Mongolia, in the rivers amongst the Siansk mountains, to the S. W. of Lake Baikal, in E. Siberia, and other places in Central Asia ; also in N. Zealand, Polynesia, and the United States. It is of various colours, white, blue, yellow and green, and the milk white and light green varieties are the most valued. It is the Yula or gem par excellence of the Chinese, and its hardness, weight, sonoriety and peculiar sombre tint are the points in this precious stone on which the Chinese found their estimate of its value. It consists chemically of the silicates of magnesia and alumina, with varying quantities of chromium, and perhaps other metals, according to the tint of the stone. Philosophers and physicians have ascribed all sorts of properties to this mineral, which however, as a medicinal substance for any purposes of pharmacy, can have no other effect than so much stealite or soapstone. The Chinese suppose it to possess humane, just, intelligent, brave and pure qualities, presumed to be conveyed to the wearer. Those who wear it are said to be relieved from the claims of gravitation. Chinese jade articles have been dug up in Europe in connection with very ancient remains.—*Smith, Frederic Porter, M. B., London, Medical Missionary in Central China, Contributions towards the Materia Medica and Natural History of China, Shanghai, London,* 1871. *Capt. Yule's Embassy to the Court of Ava, p.* 147.

YUGA, an age ; of these the hindoos reckon four, viz :—

Krita or Satya yuga,	1,728,000 years.
Dwapara yuga, ...	1,294,000 years.
Treta yuga,... ...	864,000 years.
Kali yuga, ...	432,000 years.

YUGADYA. SANS. From yuga, and adya, the first. See Yug.

YUGA PUTRU. SANS. Bauhinia candida, var. of B. variegata.

YUG-SADDAN, or Yug-brasht, or Yugbyasa, in the hindu religion, a class of persons who, by extraordinary pious pains, obtain miraculous longevity, prolonging their lives to some hundreds of years. As far as can be gathered, it is regarded by them as the faculty of drawing, by degrees, all the breath (or, perhaps, the principle of life, or the soul,) into the upper part of the head, and thus continue for any number of years the aspirant may have previously determined on, or, as others say, in proportion to his piety, in a state of insensible absorption, exempt from the destructive operations of earth or water, but not of fire. The sect called Byragi or Viragi, are apparently the most frequent and successful pretenders to this extraordinary power. Perhaps the following tale in Wilford's Egypt and the Nile, may allude to the practice. On the banks of the Kali dwelt a brahman, whose name was Lechayanasa, a sage rigorously devout, skilled in the learning of the Vedas, and firmly attached to the worship of Hari ; but having no male issue, he was long disconsolate, and made certain oblations to the god, which proved acceptable, so that his wife, Sankriti, became pregnant, after she had tasted part of the Charu, or cake of rice, which had been offered. In due time, she was delivered of a beautiful boy, whom the brahmans, convened at the jatakarma, or ceremony on his birth, unanimously agreed to name Haridata, or given by the divinity. When the sanskara, or institution as a brahman, was completed by his investiture with the sacerdotal string, and the term of his studentship in the Veda was past, his parents urged him to enter into the second order, or that of a married man ; but he ran into the woods, and passed immediately into the fourth order, disclaiming all worldly connections, and wholly devoting himself to Vishnu, he continually practised the samadhiyoga, or union with the deity by contemplation, fixing his mind so intensely on God, that his vital soul seemed concentrated in the Brahma-randhra, or pineal gland; while his animal faculties were suspended, but his body still uncorrupted, till the reflux of the spirits put them again in motion; hindus assert that some Yogi have remained in this state for years, and the fanciful gradations are minutely described in the Yoga-sastra; and even delineated in the figures called Shat-chakra, under the emblems of lotus-flowers with different numbers of petals, according to the supposed stations of the soul in her mystical ascent.—*Coleman, Mythology of the Hindoos, p.* 426. *As. Res. vol.* iii. *p.* 456. See Changa Deva.

YUKAGEER. See India.

YULATT. Hind. Populus nigra.

YUL-CHUNG. See Ladak.

YULE, Colonel, an officer of the Bengal Engineers, author of Embassy to Ava: Cathay and the way thither; he was in charge of the Observatory at Aden in 1840. Author of an account of the Kassia hills. Bl. As. Trans. 1854, vol. xiii. 153.—On native tree bridges, Scandinavian antiquities.—Tremendous falls of rain at Cherrapoonji. Ibid.—Translation of the Canal Grant of the Emperor Acbar, with notes on the western Jumna canal. Ibid, 1839, vol. x. 113.—*Dr. Buist's Catal.*

YUL-SUNG. See *Tibet.*

YUMA. See India, Khyen, Yoma.

YUMBOKH. Hind. Ulmus erosa.

YU-MUH. The nomade Yu-muh, wandering herds, one of many small scattered tribes. They and the Tosang, slayers of bird, beast, or fish, who give the skin or flesh as tribute, are variously interspersed throughout the military jurisdictions of extra-provincial China, and are administered more or less by military functionaries. The Tosang are to be found in Kirin, and Tsitsihar of the Manchurian provinces, and Urianghai; the Yu-muh are at Chang-kia-kau, and in Ili; Jeh-ho of the map, Tarbagetai, Urianghai, Kobdo, and Tibet; there are also Yu-muh between Tibet and the Kansuh frontier, under the minister residing at Si-ning-fu, and on the borders of Shansi in the Kwei-hwa command.

YUNAM, also called Nam-tso, a glacier lake in Lahul at an elevation of 15,570 feet above the sea. Glacier lakes are accumulations of water formed by one glacier obstructing the outlet of a higher one, and are of frequent occurrence. At times the wall of ice breaks away before the pressure of the swollen waters, when the lower lands become suddenly inundated, and the torrent rushes on with uninterrupted violence for miles, exercising a marked influence even down to the lower parts of the rivers. Two of the most elevated glacier lakes are the Deo-Tal, in Garhwal (17,745 feet), and the Nam-tso, or Yunam, in Lahul (15,570 feet.)

YUNAN. Hind. Pers. Greece.

YUNANI. Hind., a Greek: also in India a system of medicine. See Greeks, India, Kabul, Yavana.

YUNG-MA-DÆ. Burm. Abelmoschus esculentus, *W. & A.*

YUNG-MAI. Chin. Eriobotrya japonica. *Lindl.* Loquat.

YUN-LIANG. See Teen-tsing-foo.

YUNNAN is bounded on the north by Sze-tuen, on the south by Laos and Tonquin, on the east by Kwan-se, and Ho-nan, and on the west by the Burman empire; a small portion of the north-west is bounded by Thibet. The surface of this province is estimated at 57,000 square miles, and its population at seven millions. Yunnan is the most south westerly of the provinces of China proper, and contains a large number of mahomedans. Marco Polo, whose book was written in 1295, describes the inhabitants of the principal city as a mixed assemblage of idolators, Nestorian christians, and mahomedans. The mahomedans are said to be descendants of a body of 10,000 soldiers who were subsidized in A. D. 757 from Bagdad, and then sent to colonise Yunnan. The mahomedans of Yunnan are styled Pan-thay by the Burmese and Quay by the Chinese. Pa-thi in Burmese means any mahomedan. Yunnan has silver mines at Loosoonphoo worked by mahomedans, there, also, called Pan-thay. Yunnan became independent of China about 1856 on a revolt of the mahomedans. In 1854 the trade with Burmah was valued at half a million sterling. The western provinces of China have a population of upwards of a hundred and twenty millions, with whom, at present, India maintains no intercourse. The question of a direct route into these countries is, then, one of the deepest interest, and there are political as well as commercial advantages to be gained by driving a great highway into Western China from the Bay of Bengal: the importance of a western route into China is generally conceded. The question remains, however, whether it is practicable or not. The extremity of British territory in Pegu is within two hundred and fifty miles of Esmok, a town on the Chinese frontier. A railway, or high road, along the bank of the Salween to the neighbourhood of Monoi, would there join an existing caravan track to Esmok, and from Esmok to the Yang-tse-Kiang. Yunnan is a rich mineral country rising towards the north into a wild mountain region, but sloping to the south into a country of rich pastures and open plains. A great traffic exists over this tract between

China and the Laos States, the Siamese, the Burman Shan States of Limmai Moni and conducted by great caravans of ponies, mules, and donkeys.—*Sirr's China.*

YUNSALEN. See Karen.

YUNX INDICA appears to be met with in Afghanistan and Tibet. Mr. Gould describes a kind of nuthatch to inhabit the Himalayan mountains towards Kashmir, but the bird in question is unknown in Central India properly so designated.

YUNX TORQUILLA, the Wryneck of Europe, Asia, N. Africa, China, Japan, Kamschatka; is common in India, as in Britain; migratory.

YUPO. HIND. Avena fatua.

YUR. HIND. Salix alba.

YURISH. PERS. Assault, storm, invasion, commonly supposed to give the English or Irish cry "hooroosh."

YURO, in Mindoro, is the heart or pith of the trunk of a palm, known by the name of Cabo negro.

YUSSER, a species of kerotophyte, which abounds in the harbour of Jedda, and has a most singular effect under water, from its gently waving motion when agitated by the tide. It is of a deep black colour. On being taken up it is flexible, but when dry it becomes very brittle. One species, says Lord Valentia, my divers were very anxious I should touch with my tongue; suspecting a trick, I made them do it, and soon found by their grimaces, that it stung severely.—*Valentia's Voyage and Travels, vol.* iii. *p.* 320.

YUTE. See Krishna. Gete; Jat.

YUTHIA, or Juthia, in lat. 14° 18′ N., about 72 miles up the Menam river, was formerly the chief city of Siam, but the Siamese were driven from it in 1767 by the Burmese.

YU-THIAN. TIB. Khotan.

YUTHICA. HIND. SANS. leaves of Citrus limonum.

YUTHIKA. SANSC. great flowered jasmine, J. grandiflorum. It is also a name of a creeping kind of jasmine, J. auriculatum.—*Hind. Theat. vol.* ii. *p.* 100.

YUTI. See Bactria.

YUVA RAJAH, in ancient Vedic times, an heir apparent to the throne.

YUVA RAJA DEVA. See Inscriptions.

YUWA. BURM., a village.

YU-WAH. See India.

YUZUFZYE, a numerous tribe of Afghans, who quitted their ancient habitations between Ghizni and Kandahar, and after various unsuccessful attemps to obtain a settlement in Kabul (at the time when Mirza Ulug, surnamed Kabuli, ruled that kingdom,) finally established themselves in Swad and Bijor, which, at the period, were governed by a dynasty of princes styled Sultani, who derived their lineage from Alexander the Great. Bijor is certainly the Bazira of Alexander, and the celebrated rock of Aornos ought to be situated either in Bijor or Swad or the adjoining country of Kuttor. The Yusufzye possess, in addition to Swad and Bijor, the tract situated between those provinces, and the rivers of Kabul and Indus; the greatest part of which is described as a desert in the Ayin Akbari, but by Bernoulli as a forest.

The Yuzufzye tribes now hold all the districts to the north of the Lauddaey Sind, or eastern half of the Kabul river, though they were in Baber's time, new comers. Saint Martin, in his Memoire Analytique sur la Carte de l' Asie, in endeavouring to identify Hwuen Thsang's Ou-to-kia-han-tcha, not with Atok, but with Hund, mistaking the pronounciation of the latter name, complains in reference to Yusufzye and the region about Peshawur, that malheureusement nous sommes ici sur un terrain dont l'exploration archeologique est a peine entamee. Few even of the scores of mounds which cover the plains of Yuzufzye, have yet been in any way investigated, much less opened; and still fewer have been the attempts to search the hills which abut on this plain, although every attempt in this direction has been abundantly rewarded. From independent Chilas and the Looloosur Lake away through the Yuzufzye to Swat, there is an unknown land often entered here and there by the expeditions of the British, which it would be well for scientific as well as political reasons that we should know better. The few art remains spared by the mahomedans, with their traces of Greek origin, such as the nude figure in chain armour with the Macedonian chlamys, and the Greek head of Buddha the chin of which only is Indian, found at Jamalgarhi, make us long for an archæological survey of the land which Alexander subdued, but which the British have not even explored.—*Rennell's Memoir, p.* 161,2,3.

Y-WAI-GYEE. BURM. Adenanthera pavonina.

YZER. DUT. Iron.

YZERKRAMERI. DUT. Hardware.

Z, the twenty-sixth and last letter of the English language, is also found in most of the modern languages of Europe. It is a sibilant consonant, and is merely a sonant or vocal s. It is quite a characteristic distinction between the Sanscritic and Semitic dialects of India that the former are quite destitute of the symbol and the sound of z, whilst in the latter there are no fewer than five modifications. In the Arabic, three letters have individual powers, but with the exception of zh, which has the sound of the French j in jour, no difference of pronunciation is made in India. The hindoo races who do not use z, are not able to distinguish between z and j, so that zor, strength, becomes jor, union ; roz day is pronounced roj, for there is not any letter corresponding to z in the Sanskrit, Hindi, Marathi, Guzerati, Bengali, Urya, Telugu, Karnata, Tamil, or Malayalam.

ZAABUT. Ar. a large bag-sleeved, black or brown colored robe, made of home-spun woollen, the garb of the Arab peasant, the hedge-priest, and the dervish.—*Burton's Pilgrimage to Meccah, vol. I. p.* 24.

ZAB. A river which divides the province of Fars from Khuzistan ; it is navigable for boats as far as the town of Endian, a distance of sixteen miles from the sea. Athur, the ruined city near the mouth of the upper Zab, now usually known by the name of Nimrud, is called Ashur by the Arabic geographers, and in Athur we recognise the old name of Assyria, which Dio Cassius writes Atyria, remarking that the barbarians changed the Sigma into Tau.—*Muller's Lectures, p.* 233. *Malcolm's History of Persia, vol. I. p.* 2.

ZABAB. Heb. Gold.

ZABABI. Hind. a kind of emerald.

ZABAD. Arab. Civet.

ZA-BAING, a tribe in Burmah. No trace of the Mon is left along the Yuma range,—tribes of the Karen family being the exclusive holders of its inner valleys. Some of the very imperfectly described tribes on the eastern side of the Irawadi, to the north of the Ka-ren-ni, viz, the Za-baing, Khyen, &c. may belong to the older immigrants.

ZABARJAD. Malay. Topaz ?

ZABAYER, a group of volcanic islands in the Red Sea ; also written Zebayer. See Zebayer, Volcano.

ZABEID. See Chaldea.

ZABIB. Ar. Vitis vinifera, *Linn.* raisins.

ZABIT. Arab. Pers. a chief magistrate of a town ; in Egypt, the police magistrate.

ZABLESTAN. See Kandahar.

ZABRJAD, or Zamarrad. Hind. Emerald.

ZABTI. Arabo-Hind. resumed property or under arrest ; also, in the Punjab, crops of the more valuable kind, poppy, sugar-cane, &c. on which a special acreage is charged. In the Panjab, opium is not made a Government monopoly as it is in Bengal ; the people are free to cultivate if they choose, only it ranks as a "Zabti" crop, and has certain higher charges made upon it.

ZABUL, also Zabulistan, or Zawulistan, a large province south of Balkh and Kabul, including Sistan, and having Ghazni for its capital. Rustam Zabuli, the hero of the Shahnama, is said to have been a native of this country.

ZABULON. In a two hours walk from Nazareth, Seppown is reached ; it is a small town upon a height near the entrance to the vale of Zabulon. From its situation, it has gained an unhappy distinction in the wars of the Holy Land. Six-hundred christian knights were massacred in front of it by Jappadin. The valley of Zabulon is narrow and well wooded. It is cultivated ; but, although the soil appears good, tillage is not very general—*Skinner's Overland Journey, vol. I. p.* 140-1.

ZAC. See Capreæ.

ZADIANUJ. Ar. Fennel ; Nigella sativa.

ZADWAR. Ar. Curcuma zedoaria, *Roxb.*

ZAFARAN. Hind. Crocus sativus.

ZAFAR-NAMAH, the Persian name of a work, purporting to contain a conversation between Aristotle and Burzurjmiher.

ZAFFER or Zafre, an impure oxide of cobalt, prepared by calcining its ores, and mixing the product with about twice its weight of finely powdered flint. It is used for communicating a blue colour to glass, porcelain, and earthenware ; and when roasted with potash, washed, and pulverized, forms smalts. —*Waterston* quoted by *Faulkner*.

ZAFFERANO. It. Saffron, Crocus sativus.

ZAFFRAN. Arab. Pers. Hind. Crocus sativus.

ZAFFRON. Hind. Crocus sativus, *Linn.*

ZAFFRONE. It. Safflower.

ZAFIRO. It. Sapphire.

ZAFRAN-I-HADID. Pers. a sesqui-chloride of iron, made by burying for ten days in the ground a composition of iron filings and sal ammoniac, the damp of the earth causes the sal ammoniac to act on the iron.—*Dr. Honigberger.*

ZAGATAY. The reason why the Tartars took the name of Zagatay, is said to have been that a long time ago there was an emperor of Tartary, who was native of a city called Dorgancho, meaning the treasure of the world. He ruled over a vast territory which he had conquered, and when he died, he left four sons, named Gabuy, Zagatay, Esbeque, and Charcas, all sons of one mother. When the father was dying, he divided the land amongst his sons, and Zagatay received the land of Samarcand, with other territory. The father told his four sons to be as one, for that, on the day in which discord arose amongst them, they would be lost. This Zagatay was a man of great bravery and generosity, but there rose up envy amongst the brothers, and they made war upon each other. When the people of Samarcand saw this, they rose against Zagatay, killed him, with many of his followers, and made one of their own countrymen emperor. Many followers of Zagatay remained in the land in possession of property on which to live, and, when their master was killed, all the people of the country called them the Zagatay. Timur Beg and the other Zagatay who follow him, are descended from these Zagatay Tartar, and many people of the land of Samarcand have now taken this name of Zagatay, that they may share in the great name which the Zagatay have now attained.—*Markham's Embassy p.* 128, 129.

ZAGHRITAH, a shrill cry with which Arab women welcome their wanderers home; the sound so gladdening to the returner, sends a chill to the stranger's heart. The Egyptian word is generally pronounced Zaghrutah, the plural is Zagharit, corrupted to Ziraleet. The classical Arabic term is Tahlil, the Persians call the cry Ki. It is used by women, and is formed by raising the voice to its highest pitch, vibrating it at the same time by rolling the tongue, whose undulations express now joy, now grief.—*Burton's Pilgrimage to Meccah. vol.* iii. *p.* 197.

ZAGHUN. Hind. Cucumis melo.

ZAGROS, a plain on the east, bounding with Khuzistan, the pashalik of Baghdad. See Kasr-i-shirin, Khuzistan, Kurdistan, Mamaseni.

ZAGUKEI. Hind. Rumex acutus.

ZAHAL. Ar. Saturn.

ZAHARA. See Burr.

ZAHARI GUGAL. Kash. Cicuta virosa.

ZAHAR MOHRA. Hind. Bezoar. There are several of these substances, all of them reputed amongst natives of India to be capable of extracting poison from a poisoned wound, from a snake bite or arrow wound; one of these, a mineral, is a hydrate of magnesia, and that from Khatai is more opaque and pale yellow colored than that from Ladak. Zahr-mohra of Ladak and of Suket, is serpentine, a hydrate of magnesia, whether as a bezoar or as common serpentine, or as calcined bones. The Zahr mohra, applied to a snake bite, will absorb a small quantity of the poison; but common earth, always at hand, will do better. A remark of Mr. Baden Powell seems to imply that, in the Panjab, serpentine is made into cups or bowls, which are supposed to crack and split if poison is put in them. In Europe a similar superstition prevailed as to Venetian glasses, and in the middle ages, opal was believed to lose its color at the sight of poison. The kind of Zahr-mohra called "khatai," is a hydrate of magnesia, and most esteemed by the natives as a medicine. Zahr-mohra scientifically, is hydro-magnesite. A compound of magnesia is dug near Scardo in Baltistan, and there cut and turned into cups, plates, &c.; it is supposed to have a wholesome effect on any fluid put into it, and to break should poison touch it. The kind of Zahr-mohra called Khatai, or "Chinese," is much valued by natives as a medicine: they grind the stone into a fine powder with water and swallow it.—*Powell.*

ZAHAR-TOR. Hind. Identical with Zahar Mohra; its meaning is poison antidote, from zahar, poison, torna, to break.

ZAHN, also Wurtzel. Ger. Pellitory.

ZAHR. Hind. Poison, mitha zahr is a species of Aconitum, khar zahra is the Nerium odorum.

ZAIBAK is surrounded by very high hills, and has four gates. See Badakhshan.

ZAIDAN. See Khanazad.

ZAILA, and Tajowra. In 1839, after the capture of Aden, it was deemed necessary to secure command of the harbours of Zaila and Tajowra on the Donkali coast, ports in Africa, nearly opposite to Aden, and the principal outlets of the trade of Southern Abyssinia. Tajowra is a dependency of Zaila, and both places were subject to the imams of Senna, but during the revolutions at Senna, the chiefs of Zaila and Tajowra had assumed independence. Treaties were made, but Zaila and Tajowra subsequently fell under the government of the Turks.—*Treaties, Engagements, p.* 315.

ZAIN SHAH, a mahomedan saint; oblations offered at his shrine.

ZAIN-UL-ABIDIN. Ar. A mahomedan name. See Khajah.

ZAISI. Hind. Glycirrhiza triphylla.

ZAITUN. Hind. Olea Europæa, the olive tree, also, Olea ferruginea.

ZAITUN. The monastery visited by the Friar Odoric at Zaitun, or Thsiuancheu, was probably that called the Water-Lily, founded in the eighth century and still magnificent, boasting two great seven-storied towers.—*Yule Cathay I. p.* 109. *Chine Moderne, p.* 117.

ZAJ BELUR. PERS. Alum.

ZAJ-I-SHAM, a name signifying " Syrian vitriol." It is brought from the westward, and seems to be common and by no means expensive ; a large mass of it was bought for a keroone. It is of bright yellow colour, like sulphur, and looks like the ore of some metal. It appears to be full of a very astringent acid.

ZAKAT. AR. a tenth or tithe, a legal alms amongst the mahomedans.

ZAKAT. GUZ. Customs. Duties levied on commodities of importance.—*Faulkner.*

ZAKHM-I-HAIYATAH. PERS. Sphœranthus mollis; also S. hirtus, Glinus lotoides, Cissampelos Pareira, and Tinospora cordifolia.

ZALACCA. A genus of palms with an edible fruit occurring in Malacca, Penang, Assam, and the Tenasserim Provinces. One species is known as " Salac koombar" in Penang, and " Salac Batool," also " Rungun," in Malacca, Assam Koombar and Assam Paiah. The leaves are employed as thatch and for baskets, &c.—*Seeman.*

ZALACCA ASSAMICA. WALL. MSS. A plant of Assam, one of the Cocoaceæ.—*Voigt.*

ZALACCA EDULIS. REINW. AND BL.

Edible zalacca | Calamus zalacca, *Gartn.*

Grows in Burmah, the Malay and Eastern Archipelagos. A red scaly fruit is produced by this, but it is eaten by the natives only. The light Selung boat in which the maritime Selung race of the Mergui Archipelago shoot over their waters, owe their buoyancy to the stems of the edible zalacca, which form their sides. These stems are as light as, and of the consistency of cork, for which they are often substituted ; and the Selung are skilful in uniting them together to serve instead of planks, so as to make an unequalled sea boat, that floats on the waves like a swan.—*Dr. Mason's Tenasserim.*

ZALEYA DECANDRA. BURM. syn. of Trianthema decandrum, *Linn.*

ZALZALAH. HIND. PERS. an earthquake.

ZAMAI. HIND. Suæda fruticosa.

ZAMARRUD. ARAB. PERS. Emerald, also Beryl.

ZAMBA. HIND. Prunus padus.

ZAMBAK AR. Polyanthes tuberosa.

ZAMBAK. PERS. Jasminum sambac.

ZAMBURUK, wall pieces, or small cannon, mounted on camels and worked from off their backs.

ZAM-GYOUK. BURM. Garuga, sp.

ZAMIA, a genus of plants belonging to the natural order Cycadaceæ. Several species of Zamia are known, but most of them belong to the West Indies, of which two species, Z. horrida and Z. longifolia have been introduced into British India.

ZAMIA HORRIDA. JACQ. A small palm tree, one of the natural order Cycadaceæ. This family of plants have a simple cylindrical trunk increasing by the development of a single terminal bud, and covered by the scaly bases of the leaves ; another species is Z. longifolia, *Jacq.*

ZAMIN. HIND. PERS. earth, also written zemin.

ZAMINDAR. HIND PERS. a holder or occupant of a landed estate ; also written zemindar; the term is used in the Punjab only in the sense of a mere proprietor, and not as in Bengal to mean a wealthy landholder of a large estate. The zamindars or cultivators of the soil, at Jell, as throughout Kachi, are the Jet race, who there seldom move abroad but on bullocks, and never unless armed. A Jet may generally be seen half naked—seated on a lean bullock, and formidably armed with matchlock and sword, and to the north and west of Kach Gandhava, as also in Herat, Kandahar, and Kabul, the Jet are seen as itinerant artizans, like gypsies.

ZAMINDARI. The estate of a zamindar, pertaining or relating to a zamindar. Zamindarni, also zamindarni, a female of zamindar.

ZAMINKAND. HIND. Arum campanulatum, also Dioscorea bulbifera. Yam.

ZAMIN-KI-MATCHI. HIND. The fact of the imbedding of fish in the earth is stated by trustworthy writers. Mr. Bonynge says (*America*, p. 165.) I have seen the natives in the north east of India, both to my surprise and amusement, dig fish out of the earth. The fish is called " earth fish," " Zamin-ki mutchi," is of about five to seven inches in length, flat, and black in color, flesh hard, and in flavor somewhat like an eel.

ZAMORIN, a titular chief of Calicut ; it is the European term for the Samari, the descendant of a royal family who ruled there over territories now comprised in the greater part of the collectorate of Malabar. By a treaty of 18th August 1792, the zamorin agreed to act on the civil rules which the E. I. Company might introduce ; further changes were made by a treaty of June 1793, in September 1794 and 15th November 1806, the last of which gave a consolidated allowance to the zamorin, to whom is allowed the honorary title of highness. Calicut town is on the Malabar coast in lat. 11° 15¼′ N., long. 75° 47½′ E. Thick groves of cocoanut trees line the shore, and are divided from the sea by a belt of sand, while undulating green hills rise up behind, and a back ground of mountains is often hidden by banks of clouds. Its name is from Colicodu, a cock crowing, as Cheruman Permal gave his sword and all the land within cock crow of a small temple to the zamorin, or rajah of Calicut, who attained considerable power in the 15th century, but in the early wars of the Portuguese, the British and the mahomedans of Mysore, that high place was lost; Tippoo Sultan destroyed the flourishing trade, expelled from the country the merchants and factors of the foreign commercial houses; caused all the cocoanut and sandal trees to be cut down, and ordered the pepper plants in the whole surrounding district to be torn up and hacked to pieces because these plants, as he said, brought riches to the Europeans, and enabled them to carry on war against the Indians. Besides cocoanut products, coffee, pepper, cardamoms, ginger, Cocculus Indicus, gingelly seed, turmeric, arrowroot, Croton seeds, and Terra Japonica form articles of export. There are many of the Tiar and Moplah race here. Calicut was the first port at which Vasco de Gama arrived; it was visited in 1494 by Pedro da Covilham.—*Horsburgh. Bartolomeo's Voyage to the East Indies.* See Tiar, Moplah, Nicolo-di-Conti.

ZAMRUDI RANG. Hind. deep green, Zamrudi-mail-siahi rang, is very deep green, an invisible green; in silk, a deep dark green color, nearly black.

ZAMURRUD. Ar. Emerald.

ZAM-ZAM. A well near Mecca, which tradition traces to the time of Hagar and her son Ishmael as the spring that gushed forth to relieve their thirst. Its water is exported in little tins.

ZAN. Pers. A woman; hence Zanana, women's apartments.

ZANDA. Hind. Dracocephalum heterophyllum.

ZANDIAN. Tel. The zonar or sacred cord of the hindoos; zannar, zennar, zonar. See Upunainam.

ZANGAR. Verdigris, sub-acetate of copper; when pounded it yields a green or blue green of great beauty.

ZANGARI-KACHA-RANG. Hind. Verditer, a green color, not permanent; it is made by dipping cloth into a solution of verdigris.

ZANGARI-PUKHTA-RANG. Hind. Verditer, permanent blue.

ZANGARI RANG, a pale blue green color; applied also to emeralds of good color, a verditer blue or turquoise color.

ZANGBAR. Ar. Sulphate of copper; blue stone; blue vitriol.

ZANGCHA. Hind. of Basahir, brick tea.

ZANGYEEOAT-DOUP. Burm. Oak leaved Pollypod. (?) A tree of Moulmein, used for all ordinary purposes of building. Fruit used medicinally.—*Cal. Cat. Ex.* 1862.

ZANGZABIL. Hind. Ginger. Zingiber officinale; dried ginger root.

ZANJAR. Arab. Acetate of copper.

ZANNAR, Zennar, or Jannar, the brahminical and hindoo thread.

ZANONIA CLAVAGERA. Wall. This trailing plant is a native of the Khassya mountains.—*Voigt.*

ZANONIA INDICA. Linn.

Kyee-aa Burm. | Climbing cucumber Eng.

The fruit is obscurely triangular, and having the flavour of the cucumber. It climbs to the top of the loftiest trees at Alwaye, 14 miles from Cochin. Its leaves are used medicinally.—*Useful Plants. Dr. Mason's Tenasserim.*

ZANONIA ZEHNERIA. Endl.

Kyee-aa, Burm.

A plant of Tenasserim.

ZANSKAR, tributary to Indus, rises on the N. declivity of Bara-Lacha Pass, lat. 32° 47′, lon. 77° 33′, runs N. W., W., N. W., N. E., N. W., N. E., into the Indus, a few miles below Le. Length, 150 miles, receives the Trarap, 42; Zingchan Tokpo, 22 miles. The Zanskar district of Ladak lies along the two great branches of the river of the same name. Zanskar town, near the Indus river, occupies the north slope of the main Himalayan chain parallel with Kishtwar on the south. Padum, the capital, is 11,592 feet above the sea; the territory is in L. 33-34° N. and L. 77-78° E.—*H. f. et T.* 224. See India, Indus, Ladak, Maryul, Shawl goat.

ZANTEDSCHIA AROMATICA, Spreng. syn. of Homilonema aromaticum, *Schott.*

ZANZIBAR, an island on the east coast of Africa in lat. 6°9′ S. and long. 39° 14′10″ It and the greater part of the eastern coast of Africa were conquered by the Portuguese in the beginning of the sixteenth century. Driven to despair by the tyranny of their rulers, the inhabitants of Mombassa, in 1698, invited the assistance of the imam of Muscat, who expelled the Portuguese and put many of them to the sword. It was not till 1784, however, in the time of Ahmed bin Saeed, that the Muscat Arabs established a permanent footing in the island of Zanzibar, and even for many years afterwards till the accession of Syud Saeed in 1807, the subjection of Zanzibar was little more than nominal. In 1746 the people of Mombassa threw off allegiance to Muscat, elected sheikh Ahmed as their sultan, and maintained their independence till 1823, when, fearing the aggression of the imam, Soleiman bin Ali, the sultan of Mombassa, with the consent of the people, put himself under British protection. A Treaty in 1824 to that effect however was not ratified. The Zanzibar dominions extend from Cape Delgado about 1,100 miles northward along the coast. In 1844 Syud Saeed of Muscat appointed his son Syud Khalid as his deputy and successor in Zanzibar, and his son Saeed Thowaynee in Muscat. On their father's death, after arranging for a payment for Zanzibar, a dispute soon arose regarding the nature of this payment, and whether it implied the dependence of Zanzibar on Muscat. The matter was referred to Lord Canning, who awarded the payment of 1000 crowns in perpetuity but declared the independence of Zanzibar.

This place was surveyed by Captain Owen in 1824 and 25 ; his survey is incorrect, and Horsburg is indistinct. There are many shoals in the south part of the channel not laid down in the charts, It is a lovely island, of unbounded fertility ; the mango and other trees grow to an enormous size, oranges grow in profusion everywhere, and pine-apples of large size and good flavour grow wild all over the island. The Arabs grow cloves to the neglect of other produce. The soil is a rich vegetable mould, formed by decayed plants on a bed of coral ; many rare and valuable plants grow here wild : the Sarsaparilla, the Copal tree, spices of all sorts, sugar-cane of immense size, and rice. The climate is much cooler than it ever is at Bombay, and is healthy if people are moderately careful. It is dangerous for Europeans to sleep in the interior, or in any of the garden houses, because the vegetation is so exceedingly rich ; but the town is healthy ; and Europeans and Americans who have lived here for years, say they never had a day's sickness ; the thermometer never rises above 87° ; the nights are always quite cool. English and French ships-of-war are constantly coming here for supplies, and Zanzibar is rapidly becoming the emporium of all the trade of Eastern Africa. One of the prettiest features in a morning's walk through the woods is, to see the heavy dew-drops on every branch. Zanzibar is called Zungbar by Arabs, it has a considerable trade with Muscat. French, Americans, and Germans monopolize the trade. The following were the arrivals of ships here :—

1852	 74	1855	 66
1853	 76	1856	 89
1854	 81		

The French carry on the engage trade all along the east coast of Africa. The French settlements are Mayotta and Nosse Bay ; slaves are taken there in native boats from all parts of the Mozambique, then shipped to Bourbon as engaged labourers. Opposite Zanzibar, is the river Nangani, there are nine tribes, the Wasegna, Wadoi, Waseramu, Wakatoa, Watumbi, Wagnindo, Wamuera, Makondo and Makua, all subject to Zanzibar.—*Treaties, Engagements and Sunnuds, vol. VII. p.* 324.

ZANZIBAR SHUKUL. See Somal, Beer-ul-soroal.

ZAPANIA NODIFLORA. LINN ; *W. Icon.*

Lippia repens,	*Spreng.*	Verbena cuneata,	*Willde.*

An annual plant, one of the Verbenaceæ, native of the E. and W. Indies, N. America, Australia, and Polynesia grows on streams and banks of rivers in South India. Its leaves and young shoots are used in medicine.—*Voigt.*

ZAPATOS. SP. Shoes ; this Spanish word seems to have been derived from the same source as the Chappal, Hindi, the Sapate, Tam.

ZAR. HIND. Gold. P. zarin, golden.

ZARAL. HIND. Gymnosporia spinosa.

ZARANJ. The chief town of Sijistan, from which the lake formed by the Helmand and the Farra is often called the Lake of Zaranj ; it is the Zarrah of the maps.

ZARATHUSTRA SPITAMA, the Zoroaster of Europe, one of the mightiest intellects and greatest men of all time. According to Chevalier Bunsen he appeared in the reign of Vistaspa, a Bactrian king, towards the year 3000 B. C. Taking as the starting point of history the separation of the Aryan tribes—say about 2000 B. C., when Abraham was born, even then the sun-worship prevailed as the religion of the Aryans, in the plains of Mesopotamia, the table-lands of Persia, and the hills of the Caucasus. In the course of time beside this comparatively pure because monotheistic belief called *Ahura* or good, there sprang up the polytheistic faith, known as *Deva* and the origin of hindooism. Before the appearance of Spitama on the scene, the Aryans were in the first stage of progress—nomadic, wandering as the descendants of Abraham did and the Sheiks of the desert now. We can hardly fix the date of Spitama later than 1000 B. C.,—one author would make him a contemporary of Moses. The work of the sage zoroaster was twofold—to win the people back to the worship of one God through fire, and to develop them into the higher phase of agriculturists. He was a reformer, a protester against polytheism and nomadism, and his era must have been contemporaneous with the emigration of the southern branch of the Aryan race into India.

Spitama was a shoshyanto or fire priest, the son of Purushapa, and was born in Bactria, which he calls in his writings "Berekdha Armaiti." Ragha, now Rai, near Teheran, has been fixed on as his birth place, for no other reason than that it was a city governed by the priests alone. The only one of his children mentioned in his writings is his daughter Purudusta. He was a Zarathustra or high-priest, and hence is known to the Greeks as Zarastrades and Zoroastres, whence the Latin and English Zoroaster. The modern Parsees call him Zerodosht. He declared that he had a divine mission to expel all idolaters and promote the practice of agriculture, and he founded what is known as the Masda-yasna or Parsee religion, which is simply the old faith of the primitive Aryan, reformed by his hymns and writings. He laid the foundation of that Zend literature which, Dr. Haug clearly shews, required centuries for its growth, and was complete 400 B. C. He is expressly called "the celebrated in Airyana Vaejo," or the Aryan home. To the supreme deity whom his predecessors, the shoshyanto sect, had worshipped as the Ahura or the living ones, who were opposed to the Deva of the idolaters, he applies the term Ahuro-Mazdao, "that Ahura who is called Mazdao or almighty." This name denotes a conception of the deity almost identical with, because derived from the antediluvian Elohim or Jehovah. The word appears in the cuneiform inscriptions as Ahuramazada, in the times of the Sassanian kings as Ahurmazd, and in modern Persian as Ormuzd. It is worthy of prominent notice that this one god not only rewards the righteous but punishes the wicked. A separate evil spirit of equal power with Ahuramazda, and always opposed to him, is entirely strange to Zarathustra's theology, though the existence of such an opinion among the ancient Zoroastrians can be gathered from some later books, such as the Vendidad. The dualistic notion seems to have arisen from Spitama's attempts to account for the origin of evil philosophically. While "God (Ahuramazda) is, in the rock records of King Darius, only one, as Jehovah in the Old Testament having no adversary whomsoever," there are two uniform spirits, like our angels and devils. "Spentomainyus has created the light of the day, and Angromainyus the darkness of the night; the former awakens men to their duties, the latter lulls them into sleep. Life is produced by Spentomainyus, but extinguished by Angromainyus, whose hands, by releasing the soul from the fetters of the body, enable her to go up to immortality and everlasting life." But in course of time "Spentomainyus was taken as a name of Ahuramazda himself; then of course, Angromainyus, by becoming entirely separated from Ahuramazda, was regarded as the constant adversary of Ahuramazda, and thus the dualism, God and Devil, was called forth."

The writings of this really great sage show in every line, the reformer, a man who was what Abraham, Moses and Job would have been had they been left to themselves. All the sacred books of the Parsees are called Zendavesta, or Avesta Zend, the former word Zend meaning the original text. the latter its commentary. The further explanation of the Avesta is called Pazend. They were originally divided into 21 sections, called Nosk, of which only one, the Vendidad, is completely preserved. They "represent the whole religious and scientific literature current throughout the ancient Persian empire; for they treated not only of religious topics, but of medicine, astronomy, agriculture, botany, philosophy, etc. That the contents of those Zoroastrian books which were known to the Greeks and Romans, were of such a various character, undoubtedly follows from the reports which have reached our time. Indices of them, like those catalogues of the ancient literature known to Parsee priests now-a-days, were extant at the time of Alexander the Great; because Hermippos is said to have read such a catalogue." These 21 Nosk, however, as the collections of a critical age, do not include the Yasna and Visparad, which occupy towards them the same rank as the Vedas in the Brahmanic literature in reference to the Shastras and Puranas. The old Yasna is written in a peculiar dialect supposed by Dr. Haug to be that of Spitama's own district, and called Gatha. It may be described as the ancient Bactrian, which died out in the third century before Christ. It is probably the nearest approach that we have to the language spoken by the Aryans in their original seat, before separation. Yasna is the same as the Sanscrit Yajna, which means sacrifice; and Gatha, in both the Bactrian and Sanscrit, means a song. The Gatha, five in number, are in all respects the counterparts of the Vedic hymns, and are written in the same metre. On evidence similar to that which Max. Muller adduces for the earliest Vedic hymns, Dr. Haug establishes the higher antiquity of the Gatha, and the following are extracts from two important passages of the Gatha. The one a metrical speech, delivered by Zarathustra Spitama himself, when standing before the sacred fire, to a numerously attended meeting of his countrymen. The chief tendency of this speech is to induce his countrymen to leave the worship of the deva or gods, i. e. polytheism, to bow only before Ahuramazda, and to separate themselves entirely from the idolaters.

"I will now tell you, who are assembled here, the wise sayings of the most wise, the praises of the living God, and the songs of the good spirit, the sublime truth which I see arising out of these sacred flames. You shall, therefore, hearken to the soul of nature (i. e., to plough and cultivate the earth); contemplate the beams of fire with a most pious mind! Every one, both men and women, ought to-day to choose his creed (between the Deva and the Ahura religion.) Ye offspring of renowned ancestors, awake to agree with us (i. e., to approve of my lore, to be delivered to you at this moment)!"

After declaring the existence of a good and a base spirit, a god and a devil, he thus hints at immortality, in words of deepest interest, but how inferior to the revealed utterances of Job! "Thus let us be such as help the life of the future. The wise living spirits are the greatest supporters of it. The prudent man wishes only to be there where wisdom is at home."

The second extract is from a Gatha declared to be the most important piece of the whole Zendavesta, from which to learn Spitama's doctrine:—

"Blessed is he, blessed are all men, to whom the living wise god of his own command should grant those two everlasting powers (wholesomeness and immortality.) For this very good I beseech Thee (Ahuramazda). Mayest thou through thy angel of piety (Armaiti) give me happiness, the good true things, and the possession of the good mind! I believe Thee to be the best being of all, the source of light for the world. Every body shall choose Thee (believe in thee) as the source of light. Thee, Thee, holiest spirit Mazda! Thou createst all good true things by means of the power of thy good mind at any time, and promisest us (who believe in Thee) a long life. Thus I believed in Thee as the holy God, thou living Wise! Because I beheld Thee to be the primeval cause of life in the creation. For thou hast made (instituted) holy customs and words, thou hast given a bad fortune (emptiness) to the base, and a good to the good man. I will believe in Thee thou glorious God! in the last (future period of creation.") The angel Sraosha asks him—who art thou? —whose son art thou? "I replied to him: Firstly, I am Zarathustra. I will show myself as a destroyer to the liars as well as be the comforter for the religious men. As long as I can praise and glorify Thee, thou Wise! I shall enlighten and awaken all that aspire to property (who wish to separate themselves from the nomadic tribes and become settlers in a certain country)."

The following shews the sage groping after the truth, and is not unlike some passages in Job:—

"That I will ask Thee, tell me it right, thou living God! Who was in the beginning the father and creator of truth? Who made the sun and stars the way? Who causes the moon to increase and wane if not thou? Who is holding the earth and the skies above it? Who made the waters and the trees of the field? Who is in the winds and storms that they so quickly run? Who is the creator of the good minded beings, thou Wise? Who made the lights of good effect and the darkness? Who made the sleep of good effect and the activity? Who made morning, noon and night, reminding always the priest of his duties? Who has prepared the Bactrian (berekhda) home with its properties? Who fashioned, moving up and down, like a weaver, the excellent son out of the father? To become acquainted with these things, I approach Thee, wise, holy spirit! creator of all beings! *Essays on the Sacred Language, Writings, and Religion of the Parsees, By Dr. Martin Haug, Phil. Doc. late of the University of Tubingen. Gottingen, and Bonn; Supt. of Sanscrit Studies, and Professor of Sanscrit, in the Poona College; Honorary Member of the Bombay Branch Royal Asiatic Society; &c. Bombay*: 1862. See Arian, Parsee, Zoroaster.

ZARAWAND-KALAN. Hind. or Z. daraz or Z. tawil. Aristolochia longa.

ZARAWAND MUNDARAJ, or Z. khurd. Aristolochia rotunda.

The Zea genus of plants belongs to the natural order Panicaceæ. The word is identical with the Greek *Ζεια*, but the Greek plant was a species of Triticum or Hordeum, and Zea is entirely American. The Zea plants are monœcious; male flowers are in distinct spikes; calyx a 2-flowered blunt glume; corolla a blunt glume, female flowers, the calyx in a 2-valved glume; also the corolla; the style is single, filiform, pendulous; the seeds solitary, immersed in an oblong receptacle. There are six or seven varieties of Zea mays. The American variety has been extensively distributed throughout the Himalaya hills and the plains of the North West Provinces in the Panjab. It is of many kinds, red and white, &c., in parts of the Himalaya, it is being grown to 7,500 and even 8,000 feet on the Chenab and Ravi. It is a favourite food of the black bear. It is a common hot weather crop in India, is abundant towards Rawul Pindi. In some parts of the Panjab it forms a staple food of the people, ground and is made into bread, but in India a large proportion of it is eaten roasted in the ear. The stalks of the plant contain a considerable quantity of sugar, which has been economically manufactured in the crystaline state in several of the South American provinces.

In the preparation of the soil for maize cultivation, plough and cultivate, as for any other dry crop, the better the land is ploughed and worked, the more satisfactory will be the results. Manure the soil freely, apply sheep and cattle dung, decayed leaves, ashes, brickyard dust, tank-mud which has been thoroughly exposed, wild indigo, madder leaves, etc. No crop pays better for a thorough manuring. The manure should be spread evenly over the land before the last ploughing takes place. To prevent crows, squirrels, etc. destroying the seed, tar it before sowing. Take 1½ pints (½ Madras measure) of hot water, and add to it ¹⁄₁₆ of a pint (¼ ollock) of tar, mix together, and after cooling, pour the solution through about 20 measures of seed. After dusting with sand, ashes, or sawdust, to prevent the seeds adhering together, the grain is ready for sowing. Sow 30 lbs. per acre, in rows 24 inches apart, plant the seed about 2 inches deep and about 9 inches apart, during growth keep down the weeds, cultivate between the rows with hand hoes and ploughs. For harvesting, when the outer covering of the cob begins to open, and the seed is hard and glazed, it is time to commence gathering. If the season be favourable, do not be in a hurry to peel the cobs. If stored with the skins on, they must be frequently examined, lest they should heat or mould. The straw is excellent fodder, and should be carefully stored for consumption during the dry season. It is most economical to chaff or steep the straw before giving it to farm stock. The cobs may be shelled when dry; and the grain used as food, or it may be used in feeding horses, cattle, or sheep. Direct experiments have proved that, weight for weight, it produces better results than gram.—*Jameson's Report. Eng. Cyc.' Dr. J. L. Stewart, Punjab Plants, p.* 263. *Mason. O'Shaughnessy, p.* 636. *Madras Experimental Farm.*

ZEARAT. Pers. A pilgrimage.

ZEBAING, Zebeing, Zebing or Yebain, Burman Karens, a very dirty people, in the valley of the Setang, above Toungboo. They rear the silk worm and weave silk. See Zabaing.

ZEBAYER ISLANDS, with Tadjourra and Jabbal Teer, form the Red Sea group of volcanoes. Volcanic commotions or appearances are said to be observed in Assam, in Lower Bengal; Lake Loonar, Central India; on the Nerbudda; off Porebunder, in Kattiwar, and near Kurrachee. The Zebayer or Zebeer Islands, a volcanic group in the Red Sea, were active in 1846.—*Dr. Buist on Volcanoes in Bom. Geo. Trans.* 1852, *vol.* x. *p.* 140. See Zabayer, Zebayeor, Volcanoes.

ZEBDENI, a considerable village, about half way between Baalbec and Damascus, about twenty miles distant from each.—*Robinson's Travels, vol.* ii. *p.* 110. See Tehama.

ZEBEED, formerly the principal town of the Tehama district of Yemen.

ZE-BEING, A tribe in Burmah. See Karen, Zabeing.

ZEBINA. See Greeks of Asia.

ZEBRA. See Kyang, Mammalia.

ZEBU, a mule between a yak bull and Indian cow. Their forms are intermediate between the two, having most of the peculiarities by which the yak is distinguished, though in a much less degree. Their colour varies much,—black, white, and iron-grey being all common. They have coarse long shaggy hair, much shorter than in the yak, a stout rounded body, and the tail has a small tuft at the end, quite similar in miniature to that of the yak. These mules are exceedingly common in Upper Kunawar and Hangarang, and are much preferred as beasts of burden to the yak, being more docile, and less sensitive to climatic influence.—*Dr. Thomson's Travels in Western Himalaya and Tibet, p.* 91. See Yak.

ZEBU of the Eastern Archipelago. See Negros or Buglas Islands, Papuans.

ZEDER. Ger. See Cedar.

ZEDOAIRE. Fr. Zedoaria. It. Zedoary.

ZEDOARIA LONGA. syn. of Curcuma zerumbet.

ZEDOARIA ROTUNDA. syn. of Curcuma zedoaria, *Roxb.*

Zittwer,	Ger	Kichili-gadda,	Tel.

The plant yielding the zedoary of commerce is still undetermined. Mr. Colebrooke applied the term to the roots of Curcuma zedoaria, on account of the Persia and Arabic synonyms being Judwar and Zudwar. Clusius gives a plate of this zedoary, the roots of which strikingly resemble those of Atees. The Persians describe five kinds of zedoary —Chinese, Nepalese, Tibetan, Dukuni, and Spanish. There can be little doubt but that the Nirbisi is the true zedoary of ancient writers. The zedoary of commerce is the root of a plant which grows in Malabar, Ceylon, Cochin China, &c., of which there are three distinct species, supposed to be the roots of Curcuma zedoaria, *Roxb.*, and C. zerumbet, *Roxb.* The best zedoary comes from Ceylon, where C. zerumbet grows, as does also Kæmpfera rotunda; the latter plant is called in Singhalese San kenda, has purple and white flowers, appearing in March or April, leaves radicle, oblong, no stem root, biennial. It is met with in pieces of various sizes, externally wrinkled, and of an ash colour, but internally of a brownish red. The odour of zedoary is fragrant, and somewhat like that of camphor; the taste biting, aromatic, and bitterish, with some degree of acrimony. It was formerly employed in medicine, but is scarcely ever used by modern practitioners. Zedoary is imported into Bombay from China and the Malabar coast.—*O'Shaughnessy, Bengal Dispensatory p.* 167-68. *Faulkner. Powell Handbook, vol.* i. *p.* 300. *Milburn's Oriental Com.*

ZEEARAT. Arab. The visiting of the graves of deceased mahomedans, on the third day after demise, which is called the "Teeja," meaning the third day, when oblations are offered; also Phoolchurna, or spreading flowers. —*Herklots.*

ZEE-BYION, a compact, close grained Amherst wood, like Lagerstrœmia, or white jarool; used for house posts, is liable to split, but is free from the destructive influence of insects.—*Cal. Cat. Ex.* 1862.

ZEE-CALAPER. Dutch of Ceylon, Sea cocoa-nut of Seychelles, Lodoicea Seychellarum.

ZEEHAJ, Zeehajja, Zilhaj or Zoolhaj, the 12th month of the mahomedan year.

ZEEKARTEN. Dut. Chart.

ZEEKOMPASS. Dut. Compass.

ZEEN-GA-LAY. Tavoy. Ancistrolobus carneus. *Wall.*

ZEEP. Dut. Soap.

ZEERA. Hind. Cuminum cyminum. Cumin seed is grown in beds the same as the coriander; the seeds are used for seasoning curries. Much is brought from China and the Persian Gulph.—*Riddell.* See Zira.

ZEERA SIAH. Pers. Fruits of Carum nigrum, a good substitute for Carum carui, the seed of the somraj (Conyza anthelmintica), are often sold for it in the bazar; about ¼th of an inch long, slightly winged, flat, ovato-lanceolate, ribbed on one surface.

ZEE-YA. Burm. Cumin seed.

ZEGHAL-I-CHOBI. Pers. Charcoal.

ZEHEB, also Tibr. Arab. Gold.

ZEHER-MORAH. Duk. Bezoar.

ZEHR-GUGAL. Conium maculatum, also Cicuta virosa.

ZEHUJ. See Vathek.

ZEILDOCK. Dut. Canvas.

ZEIT. Arab. oil, vegetable or animal.

ZEITUN. Arab. Guz. Hind. Pers. Olive. Zeitun-ka-tel, Hind. Olive oil.

ZEKUM. Ar. Euphorbium.

ZELAZO. Port. Iron.

ZELU. Pers. Leeches.

ZELZODY KELADI, or Cloddy Islands, lie on the west coast of Sumatra. There is anchorage and shelter from the north-west storms.

ZEMBURAK. Pers. Swivel guns, sometimes discharged from the backs of camels.—*Ouseley's Travels, vol. II, p.* 202.

ZEMIN. Pers. Hind. earth, land, the world.

ZEMINDAR. Pers. Hind. a landholder.

ZEMMY KUND. Beng. See Lal Guranyo alu.

ZEMU. A valley, in Sikkim.

ZEND. The ancient nations of Iran proper or the Aryan stock, used the languages of Media and Persia. It includes the Zend of the cuneiform inscriptions and Zendavesta: the younger Pehlevi of the Sassanians and the Pa-zend, the mother of the present or modern Persian tongue: the Pushtu or language of the Afghans belongs to the same branch. Zend differs from Sanscrit as Greek, Latin and Lithuanian differ from one another and from Sanskrit. Zend is older than Sanscrit and newer than the language of the Vedas. The term Iranian is derived from Arya, and the old Persian and old Bactrian or Zend are its oldest representations. Old Persian is the language of the Avesta; Huzvaresh or Pehlevi is the language in which the commentaries and the more recent versions of the Avesta are written. Fardusi's Shah-namah is in Parsee or Pazend. Bunsen says the first cuneiform character on the Be-situn was Median or west Iranian and is to be distinguished from the language of the Zend books, which is East Iranian or old Bactrian worn down. The language of the Zend books is supposed by Haug to be Bactrian, and Bactria was the original seat of Zoroastrian lore. Zend was the Persian language previous to Darius. Zend is the language in which the Parsee religious books were written by Zoroaster. According to Professor Bopp, the Zend is as old as the Vedas; is in many respects beyond, and an improvement on the Sanscrit; and he does not admit it to be a mere dialect of the Zend, though some European authors contend that it is derived from the Sanscrit. The Zend seems to have been spoken in Bactria. Professor Rask considers that the Zend was the spoken language of Media, and that the Vendidad, one of the books written in this language, was produced before the time of Alexander the Great, and that it was the popular language of a great part of Iran. The author Masudi testifies that the books called Asta or Avasta and its commentary the Pazend, were in existence in his time, while Rhode has come to the conclusion that the collection styled Avasta contains either one or most of the compositions which existed before the destruction of the Persian empire by Alexander. The Zend and Pehlevi are believed by Anquetil du Perron to have been authentic languages through the medium of which Zertusht or Zoroaster, in the Zendavesta, handed down his religious system. Erskine, however, a great scholar, while he believes in the antiquity and authenticity of the Zend, holds that it was never a spoken language, but rather a composite of some peculiar dialect of Sanscrit and spoken Persian, made by the Parsee priests and used for the compilation of the Vendidad, which he believes to have been made about A. D. 229. One or other of these views have been held by Professors Romer, Rask, Wilson, Bopp, Richardson, Lassen, Vans Kennedy, and Sir William Jones, who distinctly stated that the Zend had been fabricated by the Parsee priests from many dialects, that its literature is worthless, and that the whole dates no farther back than the mahomedan conquest of Persia. The language of the Zend books is, however, generally regarded as the old Bactrian of the home country, worn down, that is, east Iranian. The language of the first cuneiform character is Median, or west Iranian of a later epoch than the Zend. Mr. Vigne mentions on the authority of Sir John M'Neill and Colonel Sir H Rawlinson, that a language similar to the Zend is undoubtedly spoken in the mountain of Desmar in Karadagh on the west of the Caspian and north of Ayerjiban. The Zend is said by Burnouf, Professor Wilson, and others who have studied it most successfully, to be more nearly allied to the very ancient dialect of the vedas, which preceded the classical Sanscrit, than it is to this last more cultivated speech. How this claim is to be reconciled with the comparatively recent date of all extant compositions in the Zendish language,remains, he considers, to be explained. But, that the high castes or "twice born" classes of the Indian race, as they term themselves, the brahman, the chetriya, and the vaisya hindoo, were of the same stock as the ancient Persians, may be regarded as a fact established by the affinity of their languages.—*Bunsen* iii. *pp.* 457, 570. *Ed. Ferrier's Journ. pp.* 257, 393. *The Parsees.* See India, Languages, Mamaseni, Vendidad, Writing.

ZEND-AVESTA is the name used by Khagani and other mahomedan writers to designate the commentary on the Zend. The Parsee people use the name Avesta and Zend, taking Avesta in the sense of text, and Zend as the title of the Pehlevi commentary. Professor Muller thinks, however, that the word zend was more likely the same word as the Sanskrit "Chhandas," scandere, a name given to the vedic hymns, and avesta the Sanskrit "avasthana," a word which, though it does not occur in Sanskrit, would mean settled text. Avasthita, in Sanskrit, means laid down, settled. The Zend-avesta now consists of four books, Yasna, Vispered Yashts and Vendidad (Vendidad = vidæva data; in Pehlevi, Juddivdad.) Dr. Haug, in his interesting lecture on the "Origin of the Parsee Religion," Bombay, 1861, takes Avesta in the sense of the most ancient texts. According to the Kissah-i-Sanjan, a tract almost worthless as a record of the earlier history of the Parsi race, the fire-worshippers took refuge in Khorasan forty-nine years before the era of Yezdejerd (632 A. D.) or about 583. Here they stayed 100 years, or till A.D. 683, then departed to the city of Hormuz (Ormuz in the Persian Gulf), and after staying fifteen years, proceeded in 698 to Diu, an island on the south-west coast of Katiawar. Here they remained nineteen years, to 717, and then proceeded to Sanjan, a town about twenty-four miles south of Damaun. After 300 years they spread to the neighbouring town of Guzerat, and established the sacred fire successively at Barsadah, Nausari, near Surat, and Bombay. The Zend-avesta contains the record of the Arian race in their occupation of successive countries to which they moved.

The oldest portions of this book are High Bactrian, and approach very near to the Veda language. The Zendavesta was translated into Greek some time after Alexander's death by Hermippus, the peripatetic philosopher, the pupil of Callimachus, who was one of the most learned scholars of Alexandria.—*Bombay Quarterly Review* 1856, No. viii. *p.* 67. *Muller's Lectures p.* 192. *Dr. Haug on the Origin of the Parsi Religion.* See Aryan, Hindoo, India, Sakya Muni, Vendidad, Zertusht, Zoroaster, Barbarian.

ZEND-RUD, a considerable river which rises among the mountains of Shamkheh in the Bakhtyari country ; and at the distance of twelve farsang from those mountains, there is an exceedingly lofty bridge, the Pul-i-Kelleh with three arches.—*Ouseley's Travels vol.* iii. *p.* 16. See Iran, Ispahan, Pearls.

ZENGABAD. The tribe of Karim Khan, king of Persia, whose dynasty was overthrown by the Kajar tribe, that of the present king. When they came first into these parts, they were wandering, but they are now settled in villages. There are a great many besides established in Zengabad, and many in the Pasha of Bagdad's army.

Kerwei........families 60		Sedeni........families 100	
of the Feili tribe.		Gourzei....... ,, 100	
Lor............. ,, 60			

None of these tribes depend on the Jaf, though the Jaf have many families from among them under their protection, which are not reckoned here. The Jaf being strong and well protected, are daily acquiring additions to their numbers from persecuted members of other tribes. None of the above tribes are entire. They are only fragments of tribes, of which parts exist also in the territory of Kermanshah, or of Luristan.

ZENO. See Vedas.

ZENZERO. It. Ginger.

ZEOCRITUM DISTICHON. *Beauv.* syn. of Hordeum distichon, *Linn.*

ZEOLITES. A family of minerals composed of silica, alumina, some alkali, and some water. They are abundant near Naldroog.

ZEPHON. Heb. Typhoon.

ZEPHYRANTHES TUBISPATHA. In Tenasserim, are one or two species of zephyranthes of the amaryllis tribe, which were introduced from Dr. Carey's garden at Serampore; they grow very well, and form handsome border flowers.—*Mason.*

ZEPHYRUS. See Kama.

ZERAIT. Pers. Agriculture.

ZERAMBAD. Pers. Zedoary.

ZERAMBAD, also Jadwar, Ar. Pers. Curcuma zedoaria, *Roxb.*

ZERAPHIM, a former money of account of Goa, of 240 Portuguese reis.—*Simmond's Dict.*

ZERAWAND-DARAZ, Zerawand-ut-tawil. Arab. Pers. Aristolochia longa.

ZERDAN. There is a fresh water lake in the plain of Zerdan, in the Persian province of Fars.

ZERGUL. Hind. Calendula officinalis.

ZERKA. To the southward of the river Zerka commences the country anciently inhabited by the people called Ammonites; a country in those days as remarkable for its rich productions, as for the number and strength of the cities which covered its surface. It is now one vast desert, having long since ceased to be inhabited by man in a civilized state. The ruined city of Amman is still known by its ancient name as the capital of the Ammonites; it was one of the most ancient of the cities recorded in Jewish history. It was likewise called Rabath and Osterath, and subsequently Philadelphia, having been rebuilt by Ptolemy Philadelphus. The principal ruins lie along the banks of a small river, called Moiet Amman, or water Amman, running through a valley bordered on both sides by barren hills of flint. This stream, which has its source in a pond a few hundred paces from the south-west end of the town, after passing under ground several times, empties itself into the river Zerka. A large theatre has been excavated in the side of the eastern hill and opening towards the river. It has forty-two rows of stone seats fourteen inches high, and twenty broad, divided into three portions by two open galleries. Before the theatre, and between it and the stream, are the remains of a beautiful colonnade. Eight columns, fifteen feet high, are standing with Corinthian capitals and entablature entire. There are the shafts of eight other columns. The space intervening between the river and the western hills is entirely covered with the remains of private buildings now only used for shelter for camels and sheep, there is not a single inhabitant remaining, thus realizing the prophecy concerning this devoted city, as Ezekiel writes, I will make Rabbah of the Ammonites a stable for camels, and a couching place for flocks. Behold, I will stretch out my hand upon thee and deliver thee for a spoil to the heathen; I will cut thee off from the people, and cause thee to perish out of the countries; I will destroy thee. The Ammonites shall not be remembered among the nations. Rabbah (the chief city) of the Ammonites shall be a desolate heap. Ammon shall be a perpetual desolation.—*Robinson's Travels. vol.* i. *p.* 175.

ZERKUNNEE PASS. See Khyber.

ZERNEIK-ZARD. Pers. Arsenic. Yellow sulphuret of arsenic.

ZERRAH. Ar. a spring of water; also a lake, particularly, a salt lake. The Caspian Sea, the picturesque Urumiyah, and Van, Zerrah or Durrah, in Seistan, Baktegan in Fars, and others, are instances of salt water lakes; fresh water lakes are met with in the tracts below Babylon, and again between the Elburz range on the shores of the Caspian.

ZERTUSHT. See Zoroaster.

ZERUKBAD. Arab. Zedoary.

ZERUMBAD. Pers. Curcuma zedoaria, *Roxb.*

ZERUMBET SPECIOSUM. *Jacq.* syn. of Alpinia nutans, *Roscoe.*

ZEUS. *Russel.* Carrameen, Tam. The Palankeen boy's fish of Madras.—*Ains. Mat. Med. p.* 155.

ZEUS. A deity amongst the Greeks, with attributes similar to the Roman Jupiter, the chief of the gods; the Egyptian Zeus, signified spirit (Πνευμα). Amongst the Greeks, Zeus meilichios was the friendly Zeus; in India amongst the Aryan hindus, adoration was offered to ether, the air, the atmosphere, as Indra, (Zeus) with the sacrifice of milk and the fermented juice of plants. If the letter z be in any tongue transmutable into d, Zeus would be Deus, and in the tongues of Aryan origin, deo, dev, deva, mean god, while sheo, shev, sheva, shiva, sheb, is a hindu deity. The z in Zeus of the Greeks seems changed in the Latin to j, as the genitive of Jupiter is Jovis. See Bactria.

ZEWAR, or Kali zewar. Hind. Buplurum marginatum.

ZEYLAH, in lat. 11° 22′ N., long. 43° 30′ E., is a town of some importance on the east coast of Africa.

ZEZI. Hind. of Spiti, a kind of barley.

ZHAD. See Kunawer.

ZHAKHA. See Kiang.

ZHAMO. Bhot. Sciurus lokriah, *Hodg.*

ZHANGAR. Hind. Dolomiæa macrocephala.

ZHBANG. Hind. Philadelphus, *sp.*

ZHIKAK. Hind. Daphne oleoides.

ZHIKO. Hind. Lonicera hypoleuca.

ZHING. Tibetan. Cultivated land.

ZHO. Tib. The domestic animals in Ladak are principally ponies, the yak, the zho, asses, mules, sheep, goats, and dogs. The zho is a hybrid between the yak and the common cow. The female is called a zho-mo.—*Mrs. Hervey's Adventures of a Lady in Tartary, vol.* i. *p.* 198.

ZHUK. Hind. Spiræa Kamtschatika.

ZHUNGRAM. See Kunawer.

ZIAMBA. See Marco Polo.

ZIARAT. Pilgrimage to a mahomedan saint's shrine; also the visiting of the grave of a mahomedan relative.

ZIARAT VALLEY, in Beluchistan, is of considerable extent, well watered, and cultivated. See Beluchistan.

ZIB. Arab. Guana.

ZIBAKH. Ar. Mercury.

ZIBELLINA, the Khatun Bulugan, wife of Arghun Khan, had been married to Abaka, but on his demise, according to the custom of the Mongols, she passed to the urda of her step son Arghun Khan, Kablai Khan's great nephew. His wife was Zibellina, the Khatun Bulugan, a lady of great beauty and ability. On her death, Arghun sent Marco Polo for another wife, out of the Mongol tribe of Bayaut, but Arghun died before the lady Kuka-Chin was brought, and she passed to Ghazan, the nephew of Arghun, for Arghun had been succeeded by Kai-Khatu, his brother.—*Quart. Rev., July* 1868. See Polyandry, Jews, Marco Polo.

ZIBELLINE. Fr. Zibellino. It. Sable.

ZIBETH. Ger. Zibetha. Lat. Zibetto. It. Civet.

ZIDER, also Apfelwein. Ger. Cider.

ZIFFAF. Ar. Hind. leading a bride home.

ZIFT-I-RATB, and Zift-i-yabis, Arab. ratianaj, and Catrain, Hind. are varieties of resin, colophony and dried tar.—*Powell Hand Book. v.* 1 *p.* 410.

ZIFT-I-RUMI. Hind. Pinus longifolia, also dried tar. Zift-i-ratab and Zift-i-yabis, pine resin or tar, &c.

ZIGANAH is twelve leagues from Trebizond on the road to Erzrum, and gives name to a pass called the Ziganah Dagh.—*Yule Cathay,* I. *p.* 45.

ZIKKIR. Arab. Reminiscences; amongst mahomedans, repeating the attributes of God or the creed, also devotion towards the deity.

ZIKR ISMAIL, also Zikr-ul-awaz. See Mosul.

ZILHUJ, or Zilhujja, the last month of the mahomedan year.

ZILLAH. Pers. In India, a district or local division of a country. In British India, each province is divided into zillahs, or districts, under collectors and magistrates or deputy commissioners, with joint, deputy, assistants and extra-assistants. In the Bengal Presidency these districts are in most cases grouped into divisions, each under a commissioner supervised by a revenue board or financial commissioner. English counties average 1,000 square miles in extent. In India they are much larger. In Bombay, for instance, collectorates average about 6,000 square miles, and Khandeish is supposed to be 15,000 square miles.

ZILVER. Dut. Silver.

ZILZARCH. Hind. Pers. rasaut, the extract of berberry root.

ZIMARRUD, also Permatæju. Malay. Emerald.

ZIMB. Abyss.

Dogfly,	Eng.	Zebub,	Heb.
T'zirah,	Heb.	Glossina morsitans.	Lat.

The Zimb-insect is translated hornet in Exodus chap. xxiii. ver. 28; Deut. vii. 20; Joshua xxiv. 12. It is difficult to conceive that Isaiah could have in view any other insect when he says—"The Lord shall hiss for the fly that is in the uttermost part of the rivers of Egypt." (Isaiah vii. 18). The original word rendered 'fly' in the translation is 'zebub,' and, as Bruce observes, "the Chaldee version is content with calling this animal simply 'zebub,' which signifies the fly in general, as we express it in English. The Arabs call it 'zimb' in their translation, which has the same general signification. The Ethiopic translation calls it 'tsaltsalya,' which is the true name of the particular fly in Geer, and was the same in Hebrew." Bruce has given a graphic account of this fly, and there can be little doubt that this insect is related to the family of Œstridæ. The Latin Asilus and the Greek οἶστρος were probably only different pronunciations of the same term 'ha-tsirah,' as this fly is called both by Moses and Joshua. Mr. Bracy Clark, in the 9th volume of the 'Linnæan Transactions,' part ii., 1843, refers the fly alluded to by Moses (and said to "hiss and make a noise") to Œstrus bovis, and remarks on Bruce's figure, that it has no resemblance to the genus of flies the Cuterebra, but is rather, though with something fictitious about it, allied to the genus Stomoxys, or perhaps Tabanus, both of which genera are certainly silent flies in their attacks on cattle. There can be no doubt that the οἶστρος was a perfectly distinct insect from any of the modern Œstridæ. Dr.Harris gives as names of flies, the Oreb of Ex. viii. 20; the Zebub of 2 Kings, i. 2, 3, 6, 16; the Deburrah of Judges xiv. 18, and Psalm cxviii 12; the T-sira of Ex. xxiii. 28, Josh. xxiv. 12, Deut. vi. 20; the Sarabim of Ezek. ii. 6; and the Bak of Matth. xxiii. 26.—*Kirby and Spence, Introduction to Entomology. Harris Natural History of the Bible, page* 139.

ZIMME. See Maha-radza-weng.

ZIMMER. GER. Timber.

ZIMMET, or Kanehl. GER. Cinnamon.

ZIN. PERS. HIND. GUZ. a saddle ; pronounced Zeen.

ZINAR. The sacred cord worn by the Parsi zoroastrians, and amongst hindoos by the brahman, kshatrya, vaisya, and five artizan castes, the goldsmith, ironsmith, carpenter, brazier and stone mason. It is pronounced and written variously Zennar, Zonnar, Zinnar, Zonar, and has the names of poitoo and zendiam or jandiam, amongst the peninsular hindus. Colonel Tod describing a gift to the saiva temple of Eklinga mentions that in return, the donor, who was the prince of Mewar, received lessons of morality, was initiated into the mysterious rites of Siva, and finally was invested with the triple cordon of faith (tin purwa zinar) by the hands of the sage, who became his spiritual guide, and bestowed on his pupil the title of regent (dewan) of Eklinga. When the Carthaginian gained the battle of Cannæ, he measured his success by the bushels of rings taken from the fingers of the equestrian Romans who fell in that memorable field. Akbar estimated his by the quantity of cordons (zinar) of distinction taken from the necks of the Rajpoots, and seventy-four and a half 'man' are the recorded amount. To eternize the memory of this disaster, the numerals 74½ are, amongst the Rajput race, tilac, or accursed. Marked on the banker's letter in Rajast'han it is the strongest of seals, for the 'sin of the slaughter of Cheetore' is thereby invoked on all who violate a letter under the safeguard of this mysterious number.—*Tod's Rajasthan, vol.* i. *p.* 225, 328. See Zannar, Zonar.

ZINAT UN NISSA, daughter of the emperor Aurungzeb. Kazi Shahab ud Din, following Khafi Khan, states that, in her young days she became attached to the young rajah Sahoo, and the two young people having been allowed to grow up together, on one occasion, Aurungzeb observing them in the same room forbad all future intercourse. Aurungzeb died at Ahmednuggur in the Dekhan where he was provisionally interred (somp gya), and his remains were afterwards finally placed in a tomb on the hill at Roza near Dowlatabad, and over his remains is a very simple cupola or dome. At Aurungabad, however, is the splendid tomb of his daughter; nevertheless the author of Travels of a Hindoo states, that the Zinat-Musjeed, more commonly called the Koomari-musjeed, or Maiden Mosque, was built by Zinat-ul-Nissa, the virgin daughter of Aurungzeb, who like Jehan-ara remained unmarried. The princess who built it, having declined entering into the marriage state, laid out a large sum of money in the above mosque, and on completing it she built a small sepulchre of white marble, surrounded by a wall of the same, in the west corner of the terrace. In this tomb she was buried in the year of the Hejira 1122, corresponding with the year of Christ 1710.—*Tr. Hind. vol.* ii. *page* 312.

Stannum Indicum,	LAT.	Tutanagam,	TAM.

Zinc was first mentioned by Paracelsus, in the 16th century, under the name of Zinetum; it does not occur in a native state, but is obtained from its ores, which are chiefly the sulphuret and carbonate of zinc. A native sulphate of zinc, or blende was discovered by Mr. W. Mainwaring in the Madura province, but whether the brown, yellow, or black blend, Dr. Ainslie had not been able to learn. Zinc has long been imported from China into India. The name tutenague, by which Chinese zinc was known in commerce, is evidently derived from the Tamul, tutanagum, and it was at one time called Indian tin (Stannum Indicum). The ores of zinc were no doubt employed by the ancients in making brass. Zinc is found in the state of an oxide, but principally as a sulphuret (Blende), and an impure carbonate (Calamine). From both ores it is first converted into an oxide by the process of roasting, and then reduced to the metallic form by the aid of carbonaceous matter, when it may either be fused or sublimed. Until purified by a second distillation, it contains as impurities small portions of other metals, as iron, copper, arsenic, &c. In a broken boulder that a native brought to Tavoy, was a large vein of some ore that was judged to be black blende, or black sulphuret of zinc. Mr. Mason was never able, however, to ascertain the locality whence it was brought. Dr. Helfer reported the existence of ores of zinc in the Mergui islands. He says: "The other ores, arsenic and zinc, discovered, are of less importance, though the latter may contain some silver. In British India, zinc is used in forming alloys : of these, there are alloys, with lead, chiefly used on account of the facility with which it can be turned or filed. 1 lb. of copper to 2 oz. yields a red coloured ductile alloy, with 6 oz., is common pot metal, brittle when warmed.

Zinc, tin and lead alloys ; 1½ oz. tin, ½ zinc 16 copper, pumps and corks requiring great tenacity.

1½ tin and 2 oz. brass, to 16 copper, to be cut into teeth.

1½ to 16 for turning work.

1½ to 16 nuts of coarse threads and bearings.

The hilly country of Mewar has always been known to abound in metalliferous ores, and it is supposed that the produce resulting therefrom was one of the sources of wealth, by which former ranas of Udypura, were enabled to contend successfully for so many years against the might and power of the Delhi emperors. The most celebrated of these mines, are undoubtedly those of Jàwar, where the ore is found in veins 3 or 5 inches thick and some times in bunches, in quartz rock and mixed with other stone. The pieces are broken with a hammer, and freed from the quartz rock, with which it is mixed. The pure ore being very friable, is then pounded and freed from quartz and placed in crucibles some 8 or 9 inches high and 3 inches diameter ; with necks 6 inches long and half an inch in diameter. The mouth being fastened up, the crucibles are inverted and placed in rows on a charcoal furnace, when the ore is fused in about 3 or 4 hours. If pieces of the quartz are allowed to remain with the ore, the crucibles break. From each crucible the quantity of metal collected does not vary much. In China, zinc is used in forming a gun metal, and in casting shot, and is therefore retained as a monopoly of the Chinese Government. The zinc mines are probably in the province of Kwei-chau but it is largely obtained from Yung-chang-fu in Yunnan and Han-kou.—*Captain J. C. Brooke*, of the *Mewar Bheel Corps, in Beng. As Soc. Journal, No.* III *of* 1850, *p.* 212. *Ains. Mat. Med. p.* 58. *Essay Hind. p.* 100. *Rohde MSS. Smith Chin. Mat. Med. McCulloch's Com. Dic. p.* 1269. *Mason, Tenasserim.*

ZINC-BLOOM.

Lu-can-shih,	Chin.	Calamine,	Eng.

This is obtained in the Chinese provinces of Ta-yuen-fu, Tseh-chau-fu in Shansi, and from places in Se-ch'uen and Yunan. It is a calamine of considerable purity, resembling the botrogen or zinc-bloom of mineralogists, and is believed to occur in China associated also with gold and silver ; it contains a small proportion of iron and lead ; it is alloyed with copper to form brass, and is used medicinally.—*Smith. Mat. Med. China.*

ZINGAR. Vigne surmises that modern gypsies are descendants of Kashmir hindus, who quitted the valley after the persecutions by Sikandar-But-Shikun, father of Zyn-ul-abi-din, in the year 1396 and 1400. Arab Shah, who lived at Samarcand in 1422 also in his life of Timur, supposes it possible that they are descendants of buddhists that quitted the valley B. C. 298, when persecuted by Nara or Kinnara. According to Baron de Bode, the gypsies of Persia are known as Karachi from the Turkish word Kara, meaning black ; also Kauli, (Kali, Hind., black,) also Susmani, and though Pottinger and Dr. Trithen think otherwise, they are perfectly distinct from the Luri or Lur tribes. In the northern parts of Persia, they lead a wandering life, but always aloof from the other erratic tribes. They exercise the trades of tinker, farrier, the men being musicians and the women bayaderes, the women dancing at the Persian parties or majalis to the music of stringed instruments used by the men. It is in northern Persia that they are known as Kara-chi, and in Kermanshah and Kurdistan as Kauli and Susmani. M. Khanikoff says the three tribes, Jughi, Mazoug and Luli in Bokhara seem gypsies. They profess mahomedanism, but seem to have no religion at all. They are tall, round, and of a bronzed complexion; their white teeth are not concealed, and, neither husband, father nor brother seem to care the least to whose lips their own are pressed. The Zingarro, or Chungur, of the Punjab, are a wandering houseless race, probably the same as the Chinganeh of Turkey, the Italian Zingaro, the Spanish gitano, and the English gypsy. About Delhi, the race is called kunjur, a word which, in the Punjab, properly implies a courtezan or dancing girl. —*Ferrier Journ. p.*114-115. *Pottinger's Travels.* See Ardelan, Lur, Kara Oghlan, Kermanj, Mosul.

Sonth (dry ginger,)	,,		

The native country of the common ginger plant is not known; but it is cultivated in all the warmer parts of Asia and on the slopes of the Himalaya up to 5000 feet. Its flowers are small, whitish purple, but it very rarely seeds; the roots are greatly increased. It is planted at the commencement of the rains in beds of about six feet square, and in a rich cultivated soil. The planting consists in dividing part of the green root, which the natives first soak in a mixture of cow-dung and water; it is then planted about two inches deep and about one foot apart. It requires a great deal of water, and to be kept clear of weeds. When the stalks dry, the ginger may be taken up; although it is sometimes left in the ground for a couple of years; it is better for remaining twelve months, and must be watered during the dry season, from October or November up to February and March. It is used fresh or the outer round is rubbed off and the root dried in the sun.—*Dr. O'Shaughnessy p.* 647. *Roxb. Fl. Ind. Mason. Smith. Mat. Med. China.*

ZIRA. Hind. Buplurum marginatum, also Cuminum cyminum, Mago zira is a species of the umbelliferæ.

ZIRAH GULAB. Hind. Rosa centifolia.

ZIRAI RANG. Hind. Shade of the brown, drab color of zira or cummin seed; in Pushtu, yellow colour.

ZIRAK the ancestor of the Barukzye clan of Afghans.

ZIRA SAFED, Cuminum cyminum, Cumin seed, is much used in food and mesalih condiments.—*Genl. Med. Top. p.* 153.

ZIRA SIYAH. Hind. Carum gracile, also Cuminum cyminum, black cummin; sometimes applied to carraway seed; the name is also given to Aplotaxis candicans.

ZIRCON, also called hyacinth, and jargoon, is a mineral which occurs in attached, imbedded, and loose crystals. It is found at Expailly, in France, Ceylon, at Friedrichsuarn, Norway, Greenland, the United States, &c. It contains—Silica 33·3, Zirconia 66·7. The Zircon family is richer in Ceylon than in any other part of the world; it is found in the districts of Matura and Saffragam; and is most abundant in the former, "Matura-diamond," is the name applied to its finest varieties by the dealers in gems. Besides the two well-established species, common zircon and hyacinth, there is a third, massive, opaque and uncrystalized, and of a dark brown colour. A specimen of it, from Saffragam, weighed two or three ounces. The Singhalese are completely ignorant of the true nature of zircon. The yellow varieties are sold by them as a peculiar kind of topaz, the green as tourmalines, the hyacinth red as inferior rubies, and the very light grey, as imperfect diamonds. All the varieties are found in the beds of rivers, or in alluvial ground, which, both in Saffragam and Matura, is of the same kind. Some of the best of the Ceylon jewels are probably zircon, the pale variety of which supplies the diamonds used in the jeweling of watches; and which is often sold as an inferior kind of diamond. It occurs in crystals bearing a remarkable resemblance to the oxide of tin (cassiterite), with which it is isomorphous, also in rounded grains, coloured red, brown, yellow, green or grey, rarely white, transparent to opaque, doubly refractive, lustre more or less adamantine, streak white, fracture conchoidal and brilliant. H. 7·5. S. G. 4 to 4·75, It is a silicate of zirconia, zirconia 66·23, silica 33·77. Vauquelin's analysis of zircon from Ceylon is in 100 parts zirconia 64·5, silica 32·6, peroxide of iron 2·0. Not decomposed by acids, even by muriatic acid; hot oil of vitriol, however, acts slightly on it. The name is from the Arabic word zerk, signifying a precious stone. Zircon is ordinarily divided into three varieties, the colourless or slightly smoky or jargoon, the bright red or hyacinth, and 3rd, the greyish, or brownish called zirconite.—*Bristow's Mineralogy.*

ZIRCOOA, in lat. 24° 52′ N. long. 53° 13′ E., is about 2 miles broad, and is the highest island on the south side of the Persian Gulf.

The seed or stone.

Kinar-ki-binj. HIND.

This tree is found every where in the south and east of Asia, in Arabia, in Persia, in Ceylon throughout British India, and in the Archipelago, in Sunda and the Moluccas, but growing to various dimensions. It is common all over the Punjab up to 3,000 or 4,000 feet. There are several varieties in the Panjab, Z. hortensis, Z. hysudricus. It is the Pomum Adami of Marco Polo. Mr. Masson found the Ber tree generally throughout the tract between Saiyad Wala and Lahore, a distance of 40 miles, not confined to the vicinity of villages, and attaining a much larger size than he had elsewhere seen, as also does its fruit, which is there sweet and palatable. In the Bombay presidency, Dr. Gibson failed to find any specific difference between the wild and cultivated species. It grows there to a large size, fit for planks or sleepers, for which latter it might answer well in the dry climate of Sind, where the tree is common. In Coimbatore, it is usually of small size but the dark brown wood is fine grained, strong and hard, and fitted for cabinet making purposes, for saddle-trees, implements of husbandry and sandals. In Burmah it is scarce, only found near large towns, rarely in the Pegu and Toungboo forests. Its wood is tough, strong and durable, is used for carpentry, well curbs, well wheels and ploughs: and for making charcoal; by grafting and cultivation it affords a large fruit. The fruit of the wild kind is dried and powdered, as was done with the lotus of the Lotophagi. This powder in Arabia is called Suve koon nebek, in Persian Arud-i-kinar, in Hindee Ber choonee. The bark is used in the Moluccas as a remedy for diarrhœa ; the root, with some warm seeds, in infusion in fever. The lozenges, and thickened mucilage called jujubes by the confectioners, are prepared from this and from the Z. vulgaris, a native of Syria, Persia, and Hindostan. A variety with long fruit, described by Dr. Wallich, is called in Bengal Narikeli kool. Its reddish colored round fruit is about the size of a large olive, and is used in chatnies and pickles ; the uncultivated fruit when nearly ripe tastes like a crab apple ; it is a small sour berry, a great favorite with the Burmese and Karen.—*Royle's Illustr. p.* 17, *O'Shaughnessy, page* 273. *Jaffrey, Mason. ZIZYPHUS SORORIA. SCHULT. syn. of Zizyphus jujuba, *Lam.*

ZIZYPHUS SPINA-CHRISTI, Christ's thorn, a native of the north of Africa, Palestine, Ethiopia, and Egypt; is about eight feet high, and has ovate-toothed smooth leaves, prickles twin, one straight the other incurved. The fruit is oblong, about the size of a sloe, and much eaten in Egypt and Arabia. This plant has pliant branches, is covered with thorns, and being not uncommon in Palestine, has been supposed by Hasselquist to have afforded materials for the crown of thorns with which the Lord Jesus Christ was crowned. The Paliurus aculeatus however, is the more common thorny plant in that country.—*Eng. Cyc.*

In British India, this common wild fruit tree, grows in almost every jungle. It is more especially cultivated by mahomedans round their tombs. The fruit is astringent, but sometimes of a pleasant subacid flavor—eaten chiefly by the poorer classes and wild animals. The fruit is oblong, containing a stone, and bears twice in the year, the best crop about January: after this is over, the tree is pruned, by cutting off nearly all the smaller branches. A second crop succeeds on the new wood in the rains, but, from being full of maggots, is not eatable: even in the cold weather very few of the fruit are free from this insect. The natives pretend that they have a remedy, which prevents the fruit from being attacked, but Dr. Riddell had never known it succeed. The flavour is somewhat that of a fresh apple, and the fruit when large and fine is by no means to be despised. He succeeded best by budding from a good tree on a common stock raised from seed. It will bear well in two or three years, but requires care and watering at first. A fine gum-lac is produced from this tree; the cocoon of the wild silk worm is often found attached to it. It is common at many places in the Punjab

Himalaya, especially towards the west at from 2,000 to 4,000 feet, and in Kashmir to 6,000 feet. It also occurs in the Salt Range, and is occasionally found in gardens in the Punjab. The fruit is small and sour, but is eaten.—*Dr. J. L. Stewart. Riddell.*

ZIZYPHUS XYLOCARPA. Gibson.

Got Bor. Mahr.

Dr. Gibson says that this tree is very common in the coast jungles of the Bombay Presidency, but he had not seen it inland. It is useful only for torches, for which it is valuable; the fruit burned, forms the base of a good blacking material.—*Dr. Gibson.*

This small thorny tree grows in the hot dry parts of Ceylon and throughout the south of India, and can always be recognized by the pale colour and softness of the under surface of its leaves. It is most common below the ghauts in Canara and Sunda, but it never grows to a very large size. It is common in every forest on the coast of Coromandel. In a good soil it grows to be a pretty large tree, with a tolerably erect trunk, but in general it is found in the state of a large straggling shrub. Cattle eat the leaves, young shoots, and fruit. The kernels taste like filberts, and are eaten by the natives. The wood of the largest trees is much esteemed by the natives, being yellowish or orange colored, very hard, and durable, and at the same time not very heavy. Its wood is used for implements, and its round fruit is employed in the arts, being much used by shoe-makers to blacken leather and to make blacking.—*Dr. Gibson, Voigt, Thw. En. Pl. Zeyl.* i. 74. *Cal cutta Cat. Ex.* 1862. *Rohde MSS.*

ZJHUT, the Jat, Jut or Jit race, far more numerous than perhaps all the Rajpoot tribes put together, still retains its ancient appellation throughout the whole of Sind, from the sea to the Himalaya, but there are few or none in the t'hul. Their habits differ little from those who surround them. Some of the Jat are hindus, some are sikhs, and some mahomedans.

Revati.

According to Mr. Colebrooke at the epoch of the vedas, the summer solstice was in the middle of As'lesha, the 9th lunar mansion : therefore Regulus was half a lunar mansion + 9°, that is 15° 40′ east of the summer solstice at that time. On 1st January 1859, the Long. of Regulus was 147° 52′ 30″. Hence Regulus was, at that date, 57° 52′ 30″ east of the summer solstice. The summer solstice had therefore retrograded through 42° 12′ 30″ = 42°· 208 since the epoch of the Vedas. And as the equinoxes and solstices move backward on the ecliptic at the rate of 1° in 72 years, it must have occupied 70 × 42°. 208 = 3039 years to effect the change. Hence the age of the vedas was 3039 on 1st January 1859, or their date is 1181 B.C., i. e., the early part of the 12th century before the Christian era.—

Archdeacon Pratt. in Beng. As. Soc. Journ. No. 1 *of* 1862.

ZODIACAL LIGHT, this, in the Red Sea and in Bombay, is far brighter than in England. Flashes of light, coruscations of the Aurora Borealis, in pyramidal form, would exactly describe the phenomenon. It varies, however, greatly, and often for some days together is scarcely visible.—*Burton's Pilgrimage to Meccah, vol.* i. *p.* 307.

ZOE. PUSHT. means son, generally spelled Zae, Zye or Zie.

ZOENIL. HIND. Pyrethrum, *sp.*

ZOFO. See Kunawer.

ZOGI. Dras adjoins Kashmir, the intercommunication being by the Zogi pass, a remarkable depression of 11,300 feet, through which flow the moist winds of Kashmir, and Dras is the most humid and fertile province of Tibet.

ZOHAK, according to tradition, came from Arabia.

ZOHRAH, or Zuhrah, AR. the planet Venus.

ZOHUR. AR. HIND. PERS. noon. Zohar-ka-namaz, the noontide prayers.

ZOILUS. See Greeks of Asia.

ZOLFO. IT. Sulphur.

ZOLIM-BURIKI.—? Schleichera trijuga.

ZOLLINGER, a Dutch naturalist who resided a long time in the island of Bali.

ZONAR.

Poita, Poitu.	BENG.	Yajnopavita.	SANS.
Janeo.	HIND.	Janavi,	,,
Janeu.	,,	Jhaudiam.	,,
Janwez.	MAHR.	Yadnu-pavita,	,,
Pavitra.	SANS.		

The zonar, the sacred cord worn by the hindoos, is regarded by the brahmins as of a highly mysterious and sacred import; and they do not consider an individual as fully member of his class until he has assumed this holy emblem. Some writers call this the brahminical, or priestly, or sacerdotal thread: but it is not confined even to the priestly tribe, being worn by the brahmin, chetrya and vaisya castes, by the Bed or herbalists of Bengal, by the five komsallar or artizan castes of the Dekhan, carpenters, goldsmiths, braziers, blacksmiths, and stone cutters and also by the Parsi zoroastrians. The zonar or sacred girdle is different for each of the races who wear it. It is imposed with solemnity, whence the three castes are termed Dwija, or twice-born. The investiture, with its accompanying formulæ, is considered to indicate the regeneration of the individual. The rite is applicable to all the three superior castes or the brahman, kshetriya, and vaisya, to each of whom the term Dwija is appropriate; although, as the two latter are considered to be extinct, it now signifies the brahman only. The cord of the brahman should be made of cotton, that of the kshetriya of a kind of grass, and that of the vaisya of woollen thread. The investiture of the first should take place between the ages of five and sixteen; of the second, between six and twenty-two; and of the third, between eight and twenty-four. If delayed beyond the latter period the individual is considered degraded from his caste. An essential part of the ceremony is the communication of the Gayatri or holiest verse of the Vedas. Various ceremonies are attendant upon hindu boys between infancy and the age of eight years. After that age, and before a boy is fifteen, it is imperative upon him to receive this sacred thread, which after a variety of preliminary ceremonies, is thus performed. The priest first offers a burnt sacrifice, and worships the salagrama, repeating a number of prayers. The boy's white garments are then taken off, and he is dressed in yellow or red, and a cloth is brought over his head, that no sudra may see his face; after which he takes in his right hand a branch of the vilva, Ægle marmelos, and a piece of cloth in the form of a pouch, and places the branch on his shoulder. A poita of three threads, made of the fibres of the suru, to which a piece of deer's skin is fastened, is suspended from the boy's left shoulder, falling under his right arm, during the reading of the invocations. The father of the boy then repeats certain formulas, and in a low voice pronounces three times the Gayatri. It is communicable to all three and is the following: O'm! bhurbhuvă ssuvaha, O'm! tatsa vit'hru varennyam; B'hargo devasya dhimahi dhiyo, yonaha pracho dayath. Om! Earth, Air, Heaven. O'm! Let us meditate on the supreme splendour of the divine sun, may he illuminate our understanding. After this the suru poita is taken off, and the real poita, or sacred thread, put on. During this ceremony the father repeats certain formulas; the suru poita is fastened to the vilva staff, shoes are put on the boy's feet, and an umbrella in his hand. The receiving of the poita is considered as the second birth of a hindu, who is from that time denominated twice-born. A boy cannot be married till he has received the poita. The sacred thread must be made by a religious brahman. It consists of three strings, each ninety-six hands (forty-eight yards), which are twisted together: it is then folded into three, and again twisted; these are a second time folded into the same number, and tied at each end in knots. It is worn over the left shoulder (next the skin, extending half-way down the right thigh) by the brahmans, ketries, and vaisya castes. The first are usually invested with it at eight years of age, the second at eleven, and the vaisya at twelve. The period may, from especial causes, be deferred; but it is indispensable that it should be received, or the parties omitting it become outcastes. The zonar must be made by a brahman: it is composed of three threads, each measuring ninety-six hands; they are twisted together, and folded into three, then twisted again, making it to consist of nine threads, these are again folded into three, without twisting, and each end fastened with a knot. It is put over the left shoulder next the skin, and hangs down the right thigh as low as the fingers can reach: of these zonars, a brahman wears four; the other privileged tribes but three. The number of three threads, each measuring ninety-six hands, for the sacrificial string, may have some mystical allusion to the ninety-six fixed annual sacrifices. The number three is mystical with almost all nations; and, with the hindus, may refer to the same source as the three sacred fires, the three legs of Agni, the triad of divine powers, &c.; but ninety-six does not arise from any ordinary process of three, and seven, and two, the distinguishing numbers of Agni's legs, arms, and faces. Something like the zonar wa sordered in Numbers xv. 38, in the fringes to be attached to the *Arba bamforth*, on his breast, and which every Jew still wears.—*Moor*, *p.* 379, *Cole. Myth. Hind. p.* 154 155. *Wilson's Hindoo Theatre*, *p.* 163. *Moore's Hindoo Pantheon*, *Chow-chow*, *p.* 85.

ZOLKADDER. See Kazzilbash.

ZONATHERIA, a class of zoophytes.

ZONE. See Semang.

ZONNALU. Tel. *plur.* Sorghum vulgare.

ZONURIDÆ, a family of Saurian reptiles. Tachydromus sexlineatus, the Tachydrome, is a tropical form of this family, and is found in Cochin-China, China, Borneo and Java.

ZOOBA, or Zoobub.

ZOOFA GABIS? Arab. Hyssopus officinalis.

ZOOL-FUQQAR. An ullum, a representation of the double-bladed sword of Ali.

ZOOLHUJ, the twelfth month of the mahomedans.

ZOOLJUNNA, the name of Husein's steed, meaning a winged wolf.

ZOOLOGICAL GARDENS have been established in Madras in the People's Park: the animals were first, for several years, kept in the Government Central Museum, Madras, which the editor formed.

ZOOMARA. Arab. a double clarionet.

ZOOPHYTE, from the Greek Ζωον, animal, and φυτον, a plant. The characteristic example of this creature is to be seen in the coral, and authors divide them into

I. Protozoa, including Infusoria, Foraminifera, and Spongiadæ.

II. Polypifera, including the Hydræ, Sertularia, and Pennatularia.

III. Echinodermata or Sea-Urchins and Star fishes.

The Protozoa class of zoophytes are divided into Rhizopoda and Infusoria. The Amibæ, Foraminifera and Noctilucæ are three orders of Rhizopoda. The Infusoria are said to have 71 species. They exist in all waters. The Ganges annually transports them to the ocean, to the extent of six or eight times the size of the great pyramid of Egypt. And the waters at a depth of 22,000 feet between the Philippines and Marianne Isles, yielded 116 species.

The Polypifera, the polypi, correspond with the Polype of science and the acalephous zoophytes of Cuvier. In nearly all the polype, the sexes are separate. They are arranged into the classes Sponge, Alcyonidæ, Zoantharia, Discophora, and Ctenophora.

The Sponge is an animal living at the bottom of the sea, and consist of a mass of light elastic tissue. Nearly three hundred species are known, amongst them are the Feather, Fan, Bell, Lyre, Trumpet, Distaff, Peacock, Tail, and Neptune's Glove sponge. River sponges are irregular sandy masses, piled on plants and solid bodies in fresh water. The sea sponge is found in the Mediterranean, Red Sea, and Mexican Gulf, attached to rocks, at from 5 to 25 fathoms deep. The Syrian fishermen fish for sponges from June to October in the Red Sea, the Arabs dive for them and sell them in Egypt and at Aden. The Spongia, Calcispongia, Halispongia and Spongilla, constitute a group of which the constituent structure is known. The Geodia, Cœloptychium, Siphonia, Myrmecium, Scyphia, Endea, Halirrhoa, Happalimus, Cnemidium, Jerea and Teuthium, constitute another group, depending on characters of surface and general figure.—*Figuier pages* 116 *to* 121.

ZOOS. Arab. See Sandarach.

ZOOTHERA ANDROMEDA. A ground thrush of Lombok.

ZOOTTUPAKU. Tel. Cynanchum extensum.

ZOR. Hind. Pers. strength; force; in the Zend-avesta, the water of force.

ZORAPOOR. Immediately under the walls of Kurnul lies the old town of Zora, or Jora, which answers exactly to the Choliya or Joriya of Hwen-Thsang. In some editions the words are transposed as Arcati regia sora. General Cunningham takes Sora to be the capital of king Arkatos, whether it be placed before or after his name. Arkatou has been usually identified with Arcot near Madras;

but the name of this city is believed by General Cunningham to be quite modern, and he thinks the position of Sora must be far to the north of Arcot. The Soræ nomades of Ptolemy may therefore, he says, be a branch of the Saura, who are still located on the banks of the Kistna river. One hundred miles to the west-north-west of Karnul there is also a large town named Sorapur, the raja of which still holds his patrimonial appanage, surrounded by his tribe of Bedara claiming a descent of more than thirty centuries. The Zorapur near Kurnool, however, is on rocky ground, and that south of Sholapur is surrounded by rocky hills ; and if General Cunningham had seen either place, he would have retained the old opinion that Arcot is the ancient capital of the Sora.—*Cunningham, Ancient Geog. of India, p.* 547.

ZOR-KHANEH, or Palaistra, where wrestling and athletic feats are practised.

ZOROASTER, the Seer and Lawgiver of Bactria, according to Chevalier Bunsen and Professor Max. Muller, lived B. C. 3500 to 3000. He is also supposed to have been born about 550 years before Christ, in the reign of Darius Hystaspes, the Gushtasp of the Zendavesta. Zoroaster was the lawgiver of the Persians, and his name is variously written, Zertusht, Zurtosht, Zerdusht or Zeratusht. He was the son of Puroshup, was born in the city of Rai, in Persia, and became known in the reign of king Gushtasp, the Darius Hystaspes of the Greeks, the fifth king of the Kaianian dynasty, and who embraced the faith propounded by Zoroaster. Zoroaster is said to have been then of the age of forty, and to have appeared before Gushtasp, in the thirtieth year of that monarch's reign, when he produced to the king the sacred books called Avesta, written in the Zend language. The religion lasted till the conquest of Persia by Alexander the Great. From that time, the religion of Zoroaster continued to decline, till revived in A. D. 226 by Ardeshir Babekan, son of San or Artaxerxes, and the first of the Sassanian kings. Before the advent of this teacher, the Persians were worshippers of idols, but the religion propounded by him is a theism, recognising a Creator, Ruler and Preserver. According to Anquetil du Perron, the first duty in this faith is to recognise and adore Ormuzd, the master of all good, the principle of all righteousness, according to the prescribed form of worship, and with purity of thought, word, and action, and generally to honour Ormuzd (the Almighty as he is styled in the Avesta) in all that he has produced. The second point in the theology of the Zoroastrians, is to detest Ahriman, the author of all bad, moral and physical, his productions and works. God, according to Zoroastrian theology, is the emblem of glory, refulgence, light, and in this view a Parsee while engaged in prayer, stands before a fire or directs his face towards the sun as the most proper symbol of the Almighty. The sacred fires of the Parsee fire temples are attended day and night by the Andiarva or Priest, and are never permitted to expire. They are preserved in a large chafing dish carefully supplied with fuel, perfumed by a small quantity of sandal wood or other aromatics : the illiterate adore this sacred flame, as also the sun, moon and stars, but the educated under the symbol of fire adore the Almighty or Fountain of light, the author and dispenser of all things, the sun being merely regarded as a creature of the Creator, which was to be reverenced as His best and fairest image, and for the numberless blessings it diffuses on the earth,—while the sacred flame of the fire temples was intended as a perpetual monitor to preserve their purity, of which this element is so expressive a symbol. The Parsee race, at present scattered in the south-east of Asia, originally emigrated from Persia to Guzerat. In the sixteen sloka or distiches which they prepared with a view to explain their religion to the rana at Damaun, they (1) avowed their worship of a supreme being (Hormuzd) and the sun and five elements ; (2) preserving silence while bathing ; praying ; making offerings to fire and eating ; (3) their use of incense, perfumes, and flowers in their religious ceremonies ; (4) their worship of the cow ; (5) their use of the Sadra or Shirt, as a sacred garment; and of the kusti or cincture for the loins and the cap of two folds ; (6) their use of songs and music in their marriages ; (7) ornaments and perfumes by their wives ; (8) their charity and excavating of tanks and wells ; (9) their sympathy with men and women ; (10) their use of gaomutra, one of the excretions of the cow ; (11) their wearing the sacred girdle at prayer and eating ; (12) their feeding the sacred flame with incense ; (13) their practise of devotion five times a day ; (14) their conjugal fidelity and purity ; (15) annual religious rites on behalf of ancestors ; and (16) their placing great restraints on their women after child birth. Many of these rules of conduct assimilate to those of hindoos, and some of their customs correspond with those of Tibet. When death is drawing near, prior to the flight of the soul, the body of the dying person is washed and arrayed in fine cloths. After death, the remains are placed on an oblong piece of polished stone, laid on the floor, and the following morning, generally, replaced on an iron bier : it is raised by the Nassesalar, or corpse bearers, who, after prayers by the priests, carry it to the Dokhma or tower of silence. The Dokhma is erected in a solitary place: those in Bombay being on the most secluded and highest parts of Malabar hill. Arrived at this place, the iron bier is placed on the ground, and a last look of the dead allowed by uncovering the face, and then removed within the tower, where, exposed to the vultures and other carnivorous birds, it is soon denuded of flesh, the bones fall through the iron grating into a pit beneath, from which they are from time to time removed into a subterranean entrance made for that purpose. Parsees meeting a dead body of a member of their tribe, bow to it. These religionists now perform annual ceremonies in memory of the dead, and on the "Furrohur din jasan" are performed the sacred rites of the friends who have died in long voyages, or the precise date of whose demise is not ascertained. The first act of Parsees, on their occupying any locality, is to erect the Dokhma, and it is known from this that their first settlement in Bombay was about the year 1671. After the mahomedan conquest of Persia, the Parsees, being persecuted by the Arabs, fled to the mountains of Khorassan, where they found a shelter for about a hundred years; but, being again compelled to flee from their enemies, they emigrated to the little island of Ormuz at the mouth of the Persian Gulf, and subsequently, from the same cause, they quitted Ormuz for the western coast of India. According to the Kissa-i-Sanjan, they first landed on the small island of Diu in the Gulf of Cambay, lying to the south-west of the peninsula of Katiawar, which, after a short residence of 19 years, they again quitted for Guzerat, and landed at Damaun in A.D. 717. It was here, at Sanjan, in A. D. 721, that the Parsees erected the first fire temple and saw the sacred flame kindled on its altar. They remained here in peace for about 300 years, small communities settling in other towns in Guzerat, but all engaged in cultivation. But in 1507, having engaged in the cause of a hindoo prince who sustained a defeat, they quitted Sanjan for the mountains of Baharout, taking with them the sacred fire, from which it was subsequently removed to Nowsaree; and lately, owing to disputes among the priests, it was secretly removed to Oodwara, 32 miles south of Surat, where it still exists, and being the oldest fire temple of the Zoroastrians in India, it is held in the highest veneration. The remnant of the Zoroastrian Parsees in Persia is now almost confined to the town of Yezd and the twenty-four surrounding villages, and in 1854 there were there one thousand families, comprising a population of 6,658 souls, of whom 3,310 were men and 3,348 were women. They are chiefly engaged in agricultural pursuits. At Kirman the Parsees number about 450; in Teheran there are only about fifty merchants of this race. They have fire-temples but no ancient liturgical books. The total number of this race in the present day, who are followers of Zoroaster, does not exceed 150,000 persons, and the census of the 20th August 1854 showed those of Bombay to amount to 110,544; of whom 68,754 were men and 41,790 were women. More than half the number, viz. 61,298, of all this tribe in Bombay, were merchants, bankers, or brokers. In Western India they are a liberal-minded and open-handed race, and one of their number, Sir Jamsetjee Jejheebhoy, gave away sums for public charities to the extent of nearly half a million sterling. They have two sects, the Shensoy and Kudmi, whose only dissimilarity arises from their different mode of computing, since 1746, the era of Yezdejird, which occasions a difference amongst the two sects as to the time of celebrating their festivals. The numbers of the Shensoy ten times exceed those of the Kudmi. It is a common notion that Parsees will not use fire arms, from their worshipping or venerating fire, but this is a mistake. Zoroaster, the seer of Bactria, is described in the old songs of the Zendavesta as "he who offers words in songs, who promotes purity by his praise, he upon whom Ahuramazda conferred the good gift of eloquence * * he is the only one who understands the doctrines of the Supreme God, and was in a condition to transmit them." He founded the doctrine of a duality of good and evil, and was generally supposed to have been patronized by king Kava Vistaspa; but, when proved that the Vishtaspa who is mentioned in the books of the Zendavesta, as the royal patron of Zertusht, was not the father of Darius Hystaspes, historical and philological criticism was set at rest. Zoroaster was a priest of the fire worshippers, and it is generally understood that he found the doctrine of a duality of good and evil already in vogue. What is understood by evil, is evil thought (Ako mano,) or falsehood; and this is contrasted with good thought, which is identical with the good principle. An absolute personification of the good principle is hardly to be found in the songs of Zertusht. Zoroaster's reform in Bactria occurred about the time of Menes, or about 3500 B. C. Plato speaks of him, and calls him a teacher of magic (Μαγεία), and the son of *Oromazes*, a name clearly meant for *Ormuzd*, the god of the Zoroastrians. At what time Zoroaster lived has however been a disputed question. Xanthus, the Lydian (470 B. C.), as quoted by Diogenes Laertius places Zoroaster, the prophet, 600 before the Trojan war (1800 B. C.), Aristotle and Eudoxus, according to Pliny (Hist. Nat. xxx. 1), placed Zoroaster 600 before Plato; Hermippus 500 before the Trojan war. (Diog. Laert. proœm.) Pliny (Hist. Nat. xxx. 2) places Zoroaster several thousand years before Moses the Judæan, who founded another kind of Mageia. Zoroastrian books place a supreme god above the powers of nature.—*Muller's Lectures p.* 196, *The Parsees pages* 7 to 261. *Bunsen, Egypt's Place.* See Kamran, Sudra, Pappati, Parsee.

ZOROASTER, the first of a dynasty that ruled in Babylon, from B. C. 2235 to B. C. 2011, a period of 224 years, during which he had seven successors. From the Armenian edition of Eusebius, in the Chaldean lists of Berosus, the name of one Zoroaster is known to us as a royal name. It is that of the Median conqueror of Babylon, who vanquished the realm and city of the Chaldees, and founded the second Babylonian dynasty in the year 2234 B. C. See Kissa-i-Sanjan.

ZORAWUR SINGH, a Sikh general who commanded an expedition sent from Kashmeer by Goolab Singh in 1839. After taking Ladak and Iskardo, he marched up the valley of the Indus into Gnari, a province of Tibet, and captured Gurtokh, its capital. His force was inconsiderable, and he wrote in vain for supplies and reinforcements. They were not easily furnished across the many intervening ranges of snow-capped mountains, winter was now approaching, and Zorawur Singh fortified for himself a cantonment near Gurtokh, when a Chinese and Tibetan force surrounded him and cut off his supplies. His detachment was thus overpowered and himself slain. About 120 miserable Sikh fugitives found their way, half frozen, across the Niti Pass, into the British province of Kumaon, and told the tale. This occurred in the winter of 1842, at the very time when the British force of Kabool was similarly overpowered by the Afghans.—*Prinsep's Tibet, Tartary and Mongolia, page* 22.

ZORUK. The best known boats on the Indus are the *Zoruk* of the upper Indus, the *dunda* which plies from Mithankote to the sea, and the *dugga*, which is specially suited from its strong build to the navigation of the rapids between Attok and Kalabagh. The better kinds of woods used in their construction (sissoo and large babul), are procured with difficulty, and various species of timber are generally seen in one boat, such as sissoo, babul, deodar, chir, bahn, and karil. Malabar teak is much prized in the lower Indus and fetches a large price. The ordinary ferry boats are constructed by the sides and bottom being prepared separately and brought together to be secured by knees or crooked pieces nailed to the bottom and sides. The bottom is made of sissoo, the knees of mulberry or olive, and the side planks of deodar. The wedges and trenails are usually made of tut and kahu. Ropes for rafts and boats are prepared either from hemp (Cannabis Indica), sirki (Saccharum spontaneum), Typha latifolia, "dib," or other reeds, common on the river bank. Munj (Saccharum munja), is also largely employed by the native boatmen. The great boat building localities of the Punjab are Pind Dadun Khan, Wazirabad, Jelam, Attok, Nowshera, Hashtnagar, Mokhud and Kalabagh.

ZOSTEROPS. One of the most common denizens of woods and jungles, flitting noiselessly among the dense foliage, and so tame as to approach within a few feet, is the beautiful warbler, the yellow Zosterops, known by the white downy ring round the eye, from which it has received its name (Z. palpebrosus); it is about the size of the blue titmouse; the general colour is olive, approaching a light yellow on the wings, forehead, and lower parts.—*Adams.*

ZOSHO. Hind. Daphne oleoides.

ZOUAVES. See Semitic races.

ZOUNG-GA-LA. Burm. Ancistrolobus carneus, *Wall.*

ZOUNG YAH. Burm. Averrhoa carambola, *Linn.*

ZOUT. Dut. Salt.

ZOWBIAM. Tel. Sago.

ZOZYMUS. Leach. A genus of Brachyurous crustacea, of which the following species are known in the E. Indies;

Zozymus latissimus, *Edw.* New Holland.
" pubescens, *Edw.* Mauritius.
" tomentatus, *Edw.* Indian Ocean.
" æneus, *Edw.* Indian Ocean.

ZOZZOZAN. Hind. Alhagi maurorum.

ZRAND. Hind. Cuscuta pedicellata.

ZUBURJUD. Pers. Topaz.

ZUCCHERO. It. Sugar.

ZUCKER Ger. Sugar.

ZUD. Hind. Triticum æstivum.

ZUETIM. Pushtu. A species of wild olive tree, "olea," still undetermined.

ZUFA. Hind. Nepeta ciliaris.

ZUFA. Ar. A drug.

ZUFAB. Hind Hyssopus officinalis.

ZUFÆ YABIS. Ar. Hyssopus officinalis, *W.*, also written zufai yeabus and zufai yebus.

ZUFA YABIS. Hind. Nepeta ciliaris.

ZUFUR-TUKEEA. See Byragee.

ZUGAL. Ar. Charcoal.

ZUKAT. Ar. Legal alms; the term means literally purification. It is metaphorically applied by mahomedans to a tax, as its payment is considered to purify and render legal the property on which it is paid. The Zukat, or legal alms, is one in forty, or two and a half per cent. It is commanded to be paid on cattle, sheep, money, corn, fruits, and on all wares that are sold. There are many different opinions among mahomedan doctors, relative to the proportion and mode in which this tax should be collected on property of various kinds, and amongst mahomedans, it affords a constant subject for vilification. Zukat dena, almsgiving, is a part of the mahomedan religion. The zukat of Ism or names is the prescribed offerings, or the attributes of the deity.—*Malcolm's History of Persia, vol.* ii. *p.* 249, 334.

ZULEEKHA. Potiphar's wife.

ZULI. Ar. Carpets.

ZULKUDDER. See Kajar.

ZUMBOORUCK, small pieces of artillery, wall-pieces or swivels, mounted on camels. —*Fraser's Journey into Khorasan p.* 198.

ZUMEEN, Pers. Earth. Zamin-bosi, Hind. A humble salutation, literally, kissing the earth.

ZUMPUN, a Chinese district officer in the valley of the Sutlej in Hundes.

ZUM-ZUM. Hagar's well at Mecca.

ZUNDERSCHWAMM. Ger. Amadou.

ZUNG——? A small bell.

ZUNGAR, or Zungabar. Arab. Pers. Verdigris, Sulphate of copper. Blue stone.

ZUNGBARI. Persian. Pistacia terebinthus. Turpentine.

ZUNJEBIL. Pers. Ginger.

ZUNJEFER. Arab. Cinnabar.

ZUNJIRA, also written janjirah and jinjeera, a Mahratta corruption of jazirah, an island, but applied to a territory ruled by a Sidi or Habshi or Abyssinian. It extends along the western sea coast of the peninsula of India, between the Reo-dunda and Bankut rivers. About the year 1489, a party of Abyssinians, serving the Nizam Shahi dynasty, disguised as merchants, obtained permission to land three hundred boxes, each of which contained a soldier, by means of whom they obtained possession of Dhunda Rajpur. It afterwards formed part of the Bejapur Adalshahi kingdom, under whom, in the time of Sivaji, the government of S. Konkan was held by the admiral of the Bejapur fleet, who with his crews were all Abyssinians. Being hard pressed by the Mahrattas, the officers of the fleet seem to have offered their services to Aurungzeb, then at war both with Bejapur and the Mahrattas. Since that time, up to the years 1810 or 1815, they were engaged in constant wars by sea and land. The Sidi were terrible pirates, and more dreaded than all other on the pirate coast. The town and district of Jafarabad on the Kattyawar coast, is a colony from Jazirah, from which it receives a governor.—*Clune's Itinerary.*

ZUNKAR. MAD'NI. also Tutiai sabz. Pers. Sulphate of copper.

ZUNJEER. Pers. Chains, or fetters.

ZUR. Pers. Gold ; properly zar.

ZUR. Name of a mountain in Dawar, and of a celebrated idol which was there worshipped. According to Elphinstone, it is in the middle of the Lake Zaranj or Zarrah, which the natives call the Sea of Zur. Conolly however says it is not in the lake, but in the vicinity of it.—*See Elphinstone's Cabul, Book* iv. *chap.* iv.*; Reinaud, Mem. Sur l. Inde, p.* 174.

ZUR AFSHANE KAGHAZ. Hind. Gold paper.

ZURAREH.——? See Cantharides.

ZUR-DOZEE, or embroidery, is an art in which the mahomedans of British India display a great degree of skill, almost equal to that exhibited by the hindoos in weaving. They embroider Cashmere shawls and scarfs, also muslins, and net fabrics with silk, gold and silver thread. These fabrics are much esteemed in Europe, and are probably still unrivalled by similar productions in any part of the world. Another branch of needle-work allied to embroidery, which is carried on in British India, is that of flowering or ornamenting cloths with cotton thread (Chickan-kari.) The dresses of mahomedans are frequently worked in this manner, and two descriptions of it called Tartor and Sumunderludur, in which the texture of the cloth is broken down with the needle, and converted into net work, are held in the highest estimation.—*Dr. Taylor.*

ZURDA.——? Cook.

ZURF BAF, cloth of gold, or gold tissue.

ZUREEH, a tomb, in the shape of a taboot.

ZURI, a tribe of the Aimak.

ZURMISH.——? Lupinus albus.

ZURNEIK SURKH. Ar. Red sulphuret of arsenic.

ZURNUB. also Zurnui. Hind. Taxus baccata, the Himalayan yew.

ZUR-SUD, also Tamr. Arab. Turmeric.

ZURUMBAD. Curcuma zerumbet. Zedoary.

ZUR-WARAQ. Hind, gold leaf, tinsel.

ZUTPHEN ISLANDS, are four principal and several small islands, fronting the coast of Sumatra.

ZUTUP-AKU. Tel. Cynanchum extensum *Jacq.*

ZU-UL-KURNIN. Ar. a title of Alexander the Great. See Kandahar.

ZURY. Turk. A thorny shrub of Balkh on which camels graze.

ZWEIBACH. Ger. Biscuit.

ZWEIFACH KOHLENSAURES NATRON. Ger. Soda.

ZWIEBEL. Ger. Onion.

ZWIRN Ger. Thread.

ZYAH. See Joasmi.

ZYE. Pushtu., a son, also written Zoe and Zai, answering to the Scotch Mac, the Irish O, the Arabic Ibn and Wald. All the Durani tribes have names ending in Zye. According to Elphinstone, there are nine of these tribes, the Popul-zye, which is the largest; Alleko-zye; Baruk-zye; Achik-zye, Nurzye, Eusoof-zye, Hussain-zye, Ali-zye; and Ishaq-zye, the two last being the smallest. In person, the Durani are stout and well made, many of them being above the standard of the Indo-Germanic races of Europe. Some have round and plump faces; with others, the countenance is strongly marked, and with most the cheek bones are prominent. When a Durani family is by itself, the men and women eat together; but few restraints are put upon the female, and her influence is considerable. The Durani tribes, all but the Achik-zye, are religiously given, but not intolerant. They are Sunni mahomedans. Their national dance, called Attun, is danced almost every evening with songs and tales to accompany it. They have a strong love of country.—*Elphinstone's Cabool, Dr. Latham, p.* 202.

ZYGÆNA. Hammer-headed shark, a curious shark, with a head like a hammer, according to an Englishman's imagination, but like a buffalo's horned-head, according to the Burmese. The genus Zygæna belongs to the sub-class of fishes Chondropterygii, Order II Plagiostomata. First sub-order, Selachoidei, Fam. 1 Carchariidæ, Group B. zygænina. The sub-class Chondropterygii may be thus shown:

SUB-CLASS IV. CHONDROPTERYGII.

Order I. Holocephala.

Fam. 1. Chimæridæ.

Chimæra monstrosa, *L.* Europe, Cape, Japan.
Callorhynchus antarcticus, *Lacep.* S. Pacific, Cape.

Order II. Plagiostomata.

FIRST SUB-ORDER SELACHOIDEI.

Fam. 1. Carchariidæ.

Group A.—Carchariina.

Carcharias, *Cuv.*

α. *Scoliodon.*

laticaudus, *M. and H.* E. Indies, China, Japan.
acutus, *Rüpp.* Indian Ocean to Japan.
dumerilii, *Blkr.* Amboyna.

borneensis, *Blkr.* Borneo.
amboinensis, *M. and H.* Amboyna.
glyphis, *M. and H.* ?
limbatus, *M. and H.* Atlantic, Indian Ocean.
pleurotænia, *Blkr.* E. I. Archipelago.
temminckii, *M. and H.* India.
zambezensis, *Ptrs.* ?

Hemigaleus microstoma, *Blkr.* Java, Amboyna.
macrostoma, *Blkr.* Java.

Loxodon macrorhinus, *M. and H.* Indian Ocean.

Galeocerdo rayneri, *M'Donald and Barron.* Indian and Australian Seas.
tigrinus, *M. and H.* Indian Seas, Atlantic.

Galeus canis, *Bonass.* English, Indian, and Cape Seas.

japonicus, *M. and H.* Japan.

Group B.—Zygænina.

Zygæna blochii, *Cuv.* E. I. Archipelago.
malleus, *Risso.* Mediterranean, Atlantic, China, Japan, Indian Ocean, Archipelago.
tudes, *Cuv.* E. & W. Indies, Archipelago.
tiburo, *L.* W. Indies, Atlantic, China.
mokarran, *Rüpp.* Red Sea.

Group C.—Mustelina.

Triænodon obesus, *Rüpp.* Red Sea, Indian Ocean, N. Hebrides.
Triacis scyllium, *M. and H.* Japan.
Mustelus lævis, *Risso.* Cape.
manazo, *Blkr.* Japan, Ceylon.
antarcticus, *Gthr.* S. Pacific.

Fam. 2. Lamnidæ.

Group A.—Lamnina.

Lamna cornubica, *Gm.* Atlantic, Mediterranean, Japan.

glauca, *M. and H.* Cape, Japan.

Carcharodon rondeletii, *M. and H.*

Odontaspis americanus, *Mitch.* Atlantic, S. Pacific.

Fam. 3. Rhinodontidæ.

Rhinodon typicus, *Smith.* Cape, Seychelles.

Fam. 4. Notidanidæ.

Notidanus indicus, *Cuv.* Cape to California.

FAM. 5. SCYLLIIDÆ.

Scyllium marmoratum, *Benn.* E. I. Archipelago.
maculatum, *Bl. Schn.* Australian Seas.
edwardsii, *Cuv.* Cape.
capense, *M. and H.* Cape, India.
burgeri, *M. and H.* Japan, E. I. Archipelago.
laticeps, *Dum.* Tasmania.
bivium, *M. and H.* Cape.
africanum, *Gm.* S. Africa, Cape.

Ginglymostoma mülleri, *Gthr.* India.
brevicaudatum, *Gthr.* Zanzibar, Seychelles.
concolor, *Rüpp.* Red Sea, Indian Ocean, Archipelago.

Stegostoma tigrinum, *Gm.* Indian Seas.

Parascyllium variolatum, *Dum.* Tasmania.

Chiloscyllium ocellatum, *Gm.* Australia.
trispeculare, *Rich.* N. W. Australia.
malaisianum, *Less.* Archipelago.
indicum, *Gm.* Cape to Japan.
punctatum, *M. and H.* Java.

Crossorhinus barbatus, *Gm.* Australian and Japanese Seas.
tentaculatus, *Ptrs.* Australian Seas.
dasypogon, *Blkr.* Archipelago.

FAM. 6. CESTRACIONTIDÆ.

Cestracion philippi, *Lacep.* N. Zealand, Australia, Archipelago, Japan.
Quoyi. Galapagos.
galeatus, *Gthr.* Australia.

FAM. 7. SPINACIDÆ.

Acanthias vulgaris, *Risso.* Australia and temperate seas.
blainvillii, *Risso.*

Centrophorus moluccensis, *Blkr.* Europe, Moluccas.
Euprotomicrus labordii, *Q. and G.* Indian Ocean.
Echinorhinus spinosus, *Gm.* Cape, Mediterranean.
Isistius brasiliensis, *Q. and G.* Tropical Seas.

FAM. 8. RHINIDÆ.

Rhina squatina, *L.* Japan and all Seas.

FAM. 9. PRISTIOPHORIDÆ.

Pristiophorus cirratus, *Lath.* Australia.
nudipinnis, *Gthr.*
owenii, *Gthr.* ?
japonicus, *Gthr.* Japan.

SECOND SUB-ORDER BATOIDEI.

FAM. 1. PRISTIDÆ.

Pristis perrotteti, *M. and H.* E. & W. Indies, Archipelago, Red Sea.
pectinatus, *Lath.* Tropical Seas.
zysron, *Blkr.* E. Indies, Archipelago.
cuspidatus, *Lath.* E. Indies.

FAM. 2. RHINOBATIDÆ.

Rhynchobatus ancylostomus, *Bl. Schn.* E. Indies.
djeddensis, *Forsk.* Red Sea, Indian Ocean, Archipelago.

Rhinobatus thouini, *Lacess.* Archipelago.
spinosus, *Gthr.*
halavi, *Forsk.* China, Red Sea.
granulatus, *Cuv.* E. Indies, Archipelago, Australia.

nuda, *Gthr.* Indian Seas.
pastinaca, *L.* Atlantic, China, Japan.
kuhlii, *M. and H.* Indian Ocean, Archipelago.
bennettii, *M. and H.* E. Indies, China, Atlantic.
imbricata, *Bl. Schn.* Indian Seas.
zugei, *M. and H.* Madras, Penang, Indian Seas, Japan.

Tæniura lymma, *Forsk.* Indian Ocean, Archipelago.
meyeni, *M. and H.* Mauritius.
melanospila, *Blkr.* Batavia.
grabata, *Geoff.* Red Sea.

Urolophus cruciatus, *Lacess.* Australian Seas.
armatus, *M. and H.* N. Ireland.
testaceus, *M. and H.* Australian Seas.
javanicus, *Martens.* Batavia.

Pteroplatea hirundo, *Lowe.* China, Japan, Madeira.
micrura, *Bl. Schn.* E. Indian Seas.
tentaculata, *M. and H.* Red Sea, Indian Ocean.
zonura, *Blkr.* Batavia.

FAM. 6. MYLIOBATIDÆ.

Group A.—Myliobatina.

Myliobatis aquila, *L.* Mediterranean, Atlantic, Australian Seas.
cornuta, *Gthr.* Japan.
vespertilio, *Blkr.* E. I. Archipelago.
maculata, *Gray.* Indian Seas, E. I. Archipelago.
nieuhofii, *Bl. Schn.* Indian Ocean, Archipelago, Japan.
milvus, *M. and H.* E. Indian Seas, China.

Ætobatis narinari, *Euphrasen.* Tropical Seas.

Rhinoptera javanica, *M. and H.* E. Indies, Java.
adspersa, *M. and H.* E. Indies.

Group B.—Ceratopterina.

Dicerobatis japonica, *M. and H.* Japan.
eregoodoo, *Cant.* Indian Seas.
kuhlii, *M. and H.* Indian Ocean, Archipelago.

Ceratoptera ehrenbergii, *M. and H.* Red Sea.

In the sub-class Chondropterygii, the skeleton is cartilaginous and skull without sutures ; body with medial and paired fins, the hinder pair abdominal ; caudal fin, with produced upper lobe. Gills attached to the skin by the outer margin with several intervening gill-openings ; rarely one-gill open ing only. No air-bladder. Three series of valves in the bulbus arteriosus. Intestine with a spiral valve, optic nerves, commissurally united, not decussating ; ovaries with few and large ova, which are impregnated, and in some developed, internally. Embryo with deciduous external gills, males with prehensile organs attached to the ventral fins. In the family Carcharidæ, the eye has a nictitating membrane, and the mouth is crescent shaped and inferior. The Families amnidæ Rhinodontidæ, Notidanidæ, Scylliidæ, and Pristiophoridæ, have no nictitating membrane. In the saw fish family, Pristidæ, the snout is produced into an exceedingly long flat lamina, armed like a saw with a series of strong teeth along each edge. The electric organ of the family Torpedinidæ is composed of vertical hexagonal tubes between the pectoral fins and the head.

The ray family, the Rajidæ, have a broad rhombic disk, generally with asperities or spines, and the pectorals extend to the snout. The pectorals of the Trygonidæ are similarly prolonged, and they have a long and slender tail. The pectoral fins of the Myliobatidæ are greatly developed, they leave the head free, and reappear at the extremity of the snout as a pair of detached (cephalic) fins.—*Gunther, Catal. of Fishes, vol.* viii. See Fishes, Perioptha lmus, Sharks, Zygodactyle.

ZYMOOSHT AFGHANS. See Khyber.

ZYGOPHYLLACEÆ. *Lind.* The Bean, Caper tribe of plants, comprising 5 gen. 6 sp. viz., 2 Tribulus, 1 Bieberstonia, 1 Peganum 1 Zygophyllum, 1 Melianthus.

ZYGOPHYLLUM SIMPLEX, *Linn.*

Alethi. Hind.

This plant occurs in Multan ; the seeds are swept up off the ground by the poor, and used as food.—*Dr. J. L. Stewart.*

ZYNUB, sister of Hosein, son of Ali, the cousin and son-in-law of Mahomed. Even before Mahomed died three other persons, claiming to be khalifs or vicegerents, were in the field, each with a following of his own, and his death was the signal for a general dissolution of the tribes whom his personal influence alone had held together, and the schism penetrated even to Medina, where Mahomed had died, and it resulted in the ruin of Ali and his family. On the death of Mahomed the people of Medina suggested that they should elect one leader and Meccah another ; but this was not adopted, and three khalifs were successively acknowledged by the whole mahomedan world, and Arab armies poured across the northern sandy waste into Syria and Palestine. A few sieges, a few fierce battles, and these rich provinces were lost to the empire of Byzantium, the ancient Sassanian dynasty was crushed on the field of Kadesia, and Persia was added to the khalifat ; in less than three years the Arabs were masters of Egypt. The successor of Mahomed was Abubakr, the third khalif was Othman, on whose murder Ali succeeded. Ali was surnamed 'the ever victorious lion of God,' and Ali's succession marked the beginning of troubles. He was accused of having instigated Othman's assassination. Othman's bloody shirt was conveyed to Syria and displayed on the principal mosque of Damascus, to incite the Syrian army to revenge. Fifty thousand men, said the messenger who conveyed these tidings to Ali at Medina, are assembled about the robes of Othman, whose cheeks and beards have never been dry from tears, and whose eyes have never ceased from weeping blood since the hour of that prince's atrocious murder. They have drawn their swords with a solemn pledge never to return them to the scabbard, nor cease from mourning until they have extirpated all concerned in that detested transaction. This sentiment they have left as a solemn bequest to their descendants, and the earliest principle that mothers instill into the minds of their infant offspring, is to revenge the blood of Othman to the last extremity. Simultaneously with this movement in Syria, Telha and Zobeir, two of the most renowned warriors among the Arabs, and Ayasha, the favourite wife of Mahomed, repaired to Bussorah and raised the standard of rebellion against the authority of Ali. But Ali, though deficient in political ability and wanting in the tact requisite to conciliate rival and turbulent factions, was an unrivalled soldier on the field of battle. He placed himself at the head of thirty thousand men, and advanced in the direction of Bussorah. In the "battle of the Camel," 17,000 Arabs are said to have fallen, Telha and Zobeir were both killed, and Ayasha became a prisoner in the power of Ali. He treated her with the utmost courtesy and forbearance, and caused her to be escorted to Mecca. This signal victory made Ali the undisputed sovereign of Irak, Eygpt, Arabia, Persia and Khorasan, but the Syrian army remained implacable, and Amru, the conqueror of Egypt, in the presence of the whole army, acknowledged Moawyab, son of Abu Sussian, as the lawful khalif and prince of the maslmin. Ali attacked the Syrian host on the plain of Suffein. Victorious again and again in the battle-field, he allowed himself to be outwitted in diplomacy, till, in the month of Ramzan A. H. 40, the career of Ali was brought to a close by the dagger of an assassin, and Moawyah became the undisputed khalif. In all the mosques wherever the mahomedan doctrines prevailed, the names of Ali and of all his family were regularly cursed upon all occasions of public worship. His death was followed nine years after by that of his eldest son Hasan, poisoned by his own wife, at the instigation, it is said, of Moawyah, and after a lapse of two years, his second son, Hussein, crowned the misfortunes of his family by his bloody death on the plains of Karbalah, on the tenth day of the month Maharram A. H. 61. Yezid, son of Moawyah, was the reigning khalif at the time of the murder of Hussein. That event was the signal for rebellious outbreaks in all parts of his dominions, the martyred Hussein became a watchword which again and again deluged with blood the empire of the khalifs, and ultimately brought it to ruin, and has ever since separated the mahomedans into two sects embued with a bitter hatred, which (writing in A. D. 1872) up to the present moment, even under the strong power of the British, is ever liable to evince itself in outbreaks, needing armed intervention to be ready at hand. At present the only ruling house of the descendants of Ali is the Asof-Jahi in Hyderabad in the Dekhan, which has been in existence for nearly two hundred years. See Khalif, Mahomed.

THE SECOND EDITION.

OF THE

CYCLOPÆDIA OF INDIA AND OF EASTERN AND SOUTHERN ASIA, COMMERCIAL, INDUSTRIAL AND SCIENTIFIC, PRODUCTS OF THE MINERAL, VEGETABLE AND ANIMAL KINGDOMS, USEFUL ARTS AND MANUFACTURES.

EDITED BY

EDWARD BALFOUR, L. R. C. S. E., CORRESPONDING MEMBER OF THE IMPERIAL GEOLOGICAL INSTITUTE, VIENNA, FELLOW OF THE MADRAS UNIVERSITY, INSPECTOR GENERAL OF HOSPITALS, MADRAS MEDICAL DEPARTMENT.

The first edition with its two supplements had 4,300 pages with 29,870 names or articles. The second edition in five volumes contains 5,814 pages with about 60,000 headings.

MADRAS, 1*st May* 1873.

NOTICES OF THE FIRST EDITION.

Extract from the Minutes of Consultation of the Right Honorable the Governor in Council, Madras, 18*th June, No.* 812 *of* 1857.

"The work offers to supply much useful information and is, in the opinion of Government, worthy of encouragement."

Madras Journal of Literature and Science, of the Madras Literary Society and Auxiliary Royal Asiatic Society, 314, *New Ser., Vol. II, No. VI. Old Series, Vol. XVIII, No.* 43.

"The Library of the Society has been furnished by Government with a copy of the Cyclopædia of India and Eastern Asia, by Edward Balfour, L. R. C. S. E., Surgeon, Madras Army. * * *

"There is no question but that his long residence in India, his scientific researches his very variety of duties eminently fit him for a work of this character, which, however rfect and incomplete as a whole, will be of great utility and prove a valuable aid to rs."

The Athenæum, Madras, Thursday, April 1*st,* 1858.

Balfour's Cyclopædia.—This is unquestionably one of the most important works that ave hitherto been published in India. * * * Few men in India are more likely to do justice to such an undertaking. * * *

Calcutta Review, Vol. XXX, March 1858, *No. LIX.*

* We have no hesitation in saying that concealed in the soil of India, there are treasures r thousand-fold more precious than all the gold and diamonds her mines have hitherto s plied, * * and the man who effectually aids in developing these treasures must be considered a benefactor to our race. Now, such a benefactor, the laborious and accomplished compiler of the work before us; must be acknowledged by all to be * *, page 33. "We believe it to be the first work of the kind in India and the projecting of it must have en the result of a happy thought," p. 36. * * "Mr. Balfour's official connection with has placed him in the very focus of information on all points relating to the products, the ts and Manufactures of India." (p. 37.)

The work may be considered a national one. (p. 43.)

**This Cyclopædia, collecting, as it does into one convenient repository, the varied inform-
on scattered piece-meal over a thousand works! (p. 51.)**

But we must take leave of Mr. Balfour and his work, and in doing so we would ten him our hearty thanks for the abundant information he has provided us and express at same time our sense of the deep obligations under which he has laid the public. (p. 65.)

Bombay Standard, Saturday, May 1st, 1858.

* * * Madras took up a similar set of subjects long after Bombay, but the benig entrusted the work to individual hands, and the results are before the world. A mus crowded by tens of thousands monthly has nearly now for four years been open. The M people have had, if we mistake not, three splendid exhibitions. The greatest of triumphs is now before us in a work we casually mentioned about a month ago. " Balf Cyclopædia of India and of Eastern and Southern Asia," * * it is a wonderful monun to the talent, learning and industry of Dr. Balfour. * *

The Morning Post, London, June 21st, 1858.

Dr. Edward Balfour's Encyclopædia of Indian Products * * is a work of great m and infinite labour * * affords an amount of information on Indian Products hit' unknown. * *

The Indian Field, Calcutta, Saturday, September 18th, 1858.

* * A Cyclopædia of India and of Eastern and Southern Asia, treating on the produc of the Mineral, Vegetable and Animal Kingdoms, useful Arts and Manufactures, under tl editorship of Dr. Edward Balfour of the Madras Medical Establishment. A work like thi has long been a *desideratum.* * * * Dr. Balfour having undertaken it, and carried through the press has laid many under obligation in various walks of life ; for, when we known, it cannot fail to be appreciated by the botanist, the zoologist, merchant, manufacture. agriculturist and the student of science, all of whom will be glad to resort to its pages for th amount of reliable information it affords on the multifarious subjects included therein.
